Notes.

Absorption of insoluble substances .. 442
———— spectra, method of exhibiting 523
Acetone, conversion of, into lactic acid 502
Acid, oxalic, decomposition of 121
Aëroconiscope, the 140
Aërolitic shower 71
Alcoholic hydrogen chloride, action of cyanogen on 289
Alcohol, aqueous, congelation of .. 561
Alcohols, a new class of 162
———— normal, of the ethylic series 443
Alkaline salts, physiological action of 500
Amalgams of potassium and sodium .. 459
Amazon, glacial origin of valley of .. 70
Amazonian glacier, hypothesis of .. 420
Amygdaline in Vicia sativa 501
Analytical chemistry, neglect of 419
Animal life, action of fresh and salt water on 377
Ape resemblances to man 247
Aphasia 183
Aphides, colouring matter of 481
Appendiculariæ 357
Arachnide, new, in the coal-measures 458
Arctic expedition, American 227
———— regions, the 458
———— voyage, Payer and Weyprecht's, of 1871 559
Arsenic in sulphuretted hydrogen .. 402
Atomic weights of nickel and cobalt .. 541
Aurora, spectrum of the 44, 184
———, the, and earth currents 44
Australian vertebrates 357
Avógadro's law 44
Bacteria, relations of, to Penicillium glaucum 268
Balloons, the Paris 161
Barents, discovery of winter quarters of 559
Barometer tubes, method of filling .. 561
Bathybius 43
————, freshwater 288
Bats, the wing of 97
——, fossil 420
Bears, British 358
Beetles in wasps' nests 14
Benzoylparasulphotoluolamide, action of chloride of phosphorus on 359
Bird, change in the habits of a 522
Blood, circulation of 70

SCIENCE AND PHILOSOPHY—*continued.*

PAGE

Blood, spectrum method of detecting 401
——— corpuscles, red, cellular structure of 378
————————, size of 539
————————, white, migration of 119
——— crystals, new 201
Bog-mosses, structure of 378
Bone-cave, an American 228
Brachiopoda, development of 560
Brain, anatomy of 538
——, connective tissue of 15
——, histology of 14
Bromine, employment of, in analysis 247
Bud varieties 161
Calcination of metallic oxides 443
Calorimetry, new method of 45
Cambium layer of bark 561
Capsules, reproductive 268
Carmine 358
Ccollpa 44
Cells, migration of 70
Ceratodus Forsteri 200
Chemical nomenclature 338
China 499
Chloral, conversion of, into aldehyde 338
Chlorine, action of light on 523
Chloroform, nitration of 459
Cholera, supposed fungoid origin of .. 228
Ciliary movement 140
Cinchona, the, in Jamaica and United States 378
———, in India 378
——— bark, a new alkaloid in .. 247
Coal, constitution of 420
Cold, effects of, upon the strength of iron 229
Colouring matters, new class of 359
Compositæ, fertilisation of 44
Conine, synthesis of 121
Consciousness and the seat of sensation 119
Coral of palæozoic type 43
——— of the Chalk Sea 358
Corals, new 246
Cornea, lymph-spaces of the 184
———, structure of 43
———, termination of the nerves in .. 500
Cretaceous epoch, duration of 43
Crinoid, an extraordinary 539
———, an interesting 560
Crinoids 316
Crustacea, new tertiary 501
Crustacean, new phyllopodous 523
Cryptogams, fossil 482
Crystallization of oxide of cadmium .. 443
Crystals of titanic acid 338
Cuba, stone implements in 269
Cyanogen, action of, on alcoholic hydrogen chloride 289
Darwinian controversy, the 200
———— literature, German 288
———— theory, the 247
Darwinism 459, 560
Deep-sea explorations 402
———— sponge, a new silicious .. 42
De Morgan, Prof. 199
———— memorial 380
Deodorizing material, a new 141
Diamond, occurrence of, in xanthophyllite 338
Diamonds at the Cape 120
Diaphorite 353
Digestion, researches on 15
Diseases, geographical distribution of 98
Disulphide, solid carbon 200
Dogs, effect of alcohol on 501
Dredging 442
———— expedition off Spain and Portugal 401
Dulcite, artificial formation of 442
Ear, structure of the internal 70
——— fungi, parasitic 161
Eclipse expeditions, American and English 117
——, the, Father Secchi on 118
Electricity, is it produced by the living human body? 161
————, statical, discharge of .. 98

SCIENCE AND PHILOSOPHY—*continued.*

Fish, new fossil 501
——, respiration of 538
Flame, the theory of 229
Flowers, closed self-fertilised 561
Fluoride of silver 201
Foliage, autumnal, colours of 120
Foraminifera, cretaceous 539
————, nomenclature of 482
Forests, destruction of 161
——, Spanish 201
Fossil Birds, Reptiles, and Batrachia of America 141
——— Crustacea, classification of .. 539
————, new British 539
Fossils, new 420
Freezing of water 483
Freieslebenite and diaphorite 358
Fruit, classification of 442
Fumariaceæ, fertilisation of 161
Fungus-foot, the Madras 442
Fur-seals, habits of 97
Galvanic battery, some forms of 317
Gases and vapours, dispersive powers of 16
——— occluded by coal 459
——, two specific heats of 44
Gastric juice, the acid of 338
Generation, spontaneous 402
Geographical explorations 140
Geological collection of N. T. Wetherell, Esq. 459
Geology, South African 70
Glacial beds, sequence of the 458
——— epoch at the equator 539
——— phenomena, recurrence of .. 539
Glaciers, actual, discovery of 287
Glands of the stomach, structure of .. 98
Glowworm, phosphoric properties of .. 522
Glutton, discovery of remains of, in England 228
Glycerine extracts of pepsine, &c. .. 98
Graft-hybridization 289
Greenland, East 287
————, interior of 499
Gregarinæ, development of the 357
Guanidine 201
Guanidines, substitute 247
Guinea-pigs, epileptic 15
Gulf Stream, the 69
————, crustacea of 228
Gun-cotton 247
Hæmatozoa 482
Heart, development of 15
——— poisons, action of 378
Heat, cooling and conduction of, in gases 230
——, influence of, on animals .. 441, 458
——, influence of a roughened surface on the emission of 16
——, mechanical equivalent of 44
Human increase, physiological laws of 97
Hydrocarbons of the marsh gas series 289
Hydrogenium amalgam 402
Iceland, crag-formation of 458
Indigo, synthesis of 71
Indigotine 338
Indium, preparation of 358
Infusoria, new flagellate 560
In Memoriam (Dear) 443
Ipecacuanha in India 378
Iron, galvanically deposited 229
——, separation of nickel and cobalt from 418
——— rust, composition of 184

THE ACADEMY.

"Inter silvas Academi quærere verum."

Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance.
The Editor of The Academy *cannot undertake to return communications which are not asked for.*
The next number will be published on Tuesday, November 15th, and advertisements should be sent in by the 9th.

NOTICE.—The Offices of the Academy *have been removed to* 14, Henrietta Street, Covent Garden, *whither all communications for the Editor, Advertisements, &c., should be sent.*

OUR FIRST YEAR.

The end of our first volume, and the beginning of another, present a convenient opportunity for considering 1. What were the objects which it was hoped to attain by originating a new periodical? 2. How far have those objects been, how far may they in future be, attained by the Academy?

1. The Academy was set on foot in answer to a widely felt and constantly expressed dissatisfaction with the existing organs of literary and scientific criticism. A critical journal was demanded which should neither praise indiscriminately nor blame from pique or prejudice; one on which the general reader might rely for guidance through the waste of superficial and ephemeral literature by which he is surrounded and through which he has neither the time nor perhaps the ability to guide himself; a journal which should systematically survey the European literary and scientific movement as a whole, and pass judgment upon books not from an insular, still less from a partisan, but from a cosmopolitan point of view; a journal, lastly, in which only permanent works of taste and real additions to knowledge should be taken into account, and in which the honesty and competence of the reviewer should be vouched for by his signature.

2. Of the quality of the criticism which has appeared in the Academy it is the part of others rather than becoming in ourselves to speak. But the circulation which the periodical has attained in this country, and the recognition which it has met with throughout the European world of letters, have, we honestly confess, exceeded our most sanguine expectations. The Editor makes this statement in no boastful spirit, but rather with a feeling of gratitude towards those many eminent men both in this country and abroad, whose willing and sympathetic assistance has rendered such a result possible.

There is another object at which we have earnestly aimed. In accordance with our original plan, we have reviewed the most important theological literature of the year, Catholic, Anglican, Protestant, even Jewish and Mohammedan, in a spirit of complete neutrality. We have offered no opinion as to the truth or falsehood of religious belief, or of any form of it; not because we are indifferent to these questions, but because we considered from the first that we should be performing a more useful part, by quitting the arena of religious polemics, and treating theology purely as a branch of learned literature. That we have not altogether failed in our effort to combine complete freedom of statement with tenderness towards the feelings of every class of believers, may be gathered from the approval with which the Academy has been received by the whole religious press of this country, ranging from the ultramontane *Tablet* on the one hand, through every phase of Anglican or Protestant opinion, to the *Jewish Chronicle* on the other.

Before leaving this point, it may be well to touch lightly on a delicate subject, on which, had it not been open to misconstruction, we should have preferred to be silent. It is this. We have felt it to be our duty to the public to transfer the publication of the Academy to a new firm. This change, while carrying with it the obvious advantage of greater facilities of communication with the Continental world of letters, has really grown out of our theological position. Mr. Murray, to whom the Academy will always be indebted for its introduction to a wide circle of readers, did not call in question the fact of our theological impartiality, but disapproved of it. The Editor, on the other hand, felt that the adoption of the theological principles of the *Quarterly Review*, or of the organ of any given class of the English public, would have involved the surrender of one of the fundamental characteristics of the Academy, one, too, which we had pledged ourselves to maintain. Under these circumstances, Mr. Murray has come forward in the most honourable manner, and offered to resign all his interest in the copyright of the Journal. Holding the principle at issue to be an important one, we have accepted his offer: and we now bid him, not ungratefully, a courteous farewell!

One most unmistakeable sign that the Academy has supplied a want, is the general outcry for its enlargement. To this appeal we give a hearty response. The Academy, as it exists at present, is merely the germ of that which we hope it will become. During the past year we have made it our first duty to establish our competence to treat of those weightier matters which had hitherto been most neglected by English critics. But the purely scientific portion of the Academy being now completely organized, we shall concentrate our attention during the ensuing year on the best means of meeting the wishes of those, who desire a more authoritative organ of criticism than has hitherto existed upon the Fine Arts, and a variety of other subjects of more general interest. Hitherto this department has occupied but one-third of the whole Journal. So soon, however, as the present exceptional depression of the book-trade both at home and abroad shall have ceased—if possible at the beginning of the new year—we intend to publish a number of the Academy every fortnight, and without diminution of our scientific departments, to devote one-half of each number to General Literature. Amongst the new subjects which we hope to introduce, will be Old English Literature; Geography and Travel; Biography, Letters, &c.; Music, Painting, Architecture and Sculpture; Law and Political Economy; as well as some branches of Natural Science which from want of space have been hitherto neglected.

The extension of our space will also enable us to attend to another suggestion, by providing even in our more difficult articles such explanations, that the unlearned reader may derive some instruction from at least a portion of them.

In thus acceding to the wishes which have been so largely expressed, we are developing a new phase of our programme, whilst maintaining in the strictest integrity that portion of it which has been already accomplished.

Editor.

General Literature and Art.

The Mystery of Edwin Drood. By Charles Dickens. London: Chapman and Hall, 1870.

Just as we are warned not to call a man's life happy till we know the manner of his death, we should withhold our final judgment on a writer till we have been enabled to

compare his last work with his first, and both with his greatest. With men of real genius, and, of course, in the case of others the experiment is not worth trying, it is possible to trace all their successes home to some inalienable mental quality, which, through old age and exhaustion, will still maintain the same proportionate importance amongst other faculties. But a weakness in disguise, or a merely fortunate trick, is sure to be discovered and condemned, when, from indolence or habit, the author repeats it once too often, and the original indulgence is then felt to have rested on insufficient grounds. To take the most illustrious instance possible: whilst Goethe was in his prime, it was natural to suppose that the mystifications, which he sometimes prepared for his readers and disciples, had a deep purport to be disclosed in his good pleasure; and people like Diogenes Teufelsdröckh guessed his riddles with more or less ingenuity and good temper, until the encroachment of the spirit of obscurity in the last part of *Faust* and *Wilhelm Meister*, gave credit to the idea that he was only oracular when he did not see clearly himself. It may be replied that when he did not see clearly it was that he had withdrawn to a distance from which he had a wider view; but the illustration will serve to shew in what sense it is fair to fix an author's merits by the degree of resemblance between his best works and his comparative failures—resemblance, not in plot or subject, but in methods or sources of effect.

Dickens's vast and wide-spread popularity has not prevented the question from being raised, whether he had a genuine talent, or were only a skilful master of the machinery of burlesque. The answer lies in the fact that his last books have sentences and sometimes whole scenes equal to anything in his first, and that with him the difference between worst and best is only that between the more or less frequent exercise of a pleasant power, not between power and failure. And yet the doubt is not quite unreasonable, for though we may be certain that Mrs. Gamp and the Wellers are truly comic characters, and may be expected to endure as such, Winkle and Captain Bunsby and the like are on a different footing, though they are scarcely less popular with the mass of readers. They are invented to do what we may call the comic business, and they are often dangerously near the borders of conventional farce. Their escape, when they escape, is due to the double character of Dickens's humour, which has a realistic as well as an imaginative side. Not only is every grotesque incident doubly grotesque to him, but he has the power of setting forth the image in his own mind with such vivid detail, colour, and perspective, that his picture, though neither real nor possible, must, in defiance of nature, be described as life-like. It is these personages, invented with reckless fertility, who make his books a populous world apart; their whole existence is traced out before us, Balzac could not be more minute in describing their clothes and the furniture of their houses; to all outward appearance they live and move, they certainly make jokes, and their death seems sometimes to claim a tear. That they are altogether fantastic and absurd does not of itself affect their right to exist, and it is a remarkable triumph for their creator, that after a few hours in his low-life fairy-land they seem as real and as much in accordance with the eternal conditions of human existence as the most commonplace characters of a conscientious middle-class novel. They do not exist, but we are at a loss to say why they shouldn't exist; and while we debate the question, they *do* exist, causing people of all ages and countries to laugh a cosmopolitan laugh of simple amusement, at figures which are no more unreal in one country than another.

Had the manufacture of these oddities been merely a matter of professional dexterity, the illusion would have failed sooner or later, and we should find a grotesque mask instead of a plausible dream; as it is, even so poor a character as the Angular Mr. Grewgious in *Edwin Drood* must have been a reality to the writer before he could be endowed with so many qualities and idiosyncracies; even the misuse of capital letters in his service, indicates a forlorn hope of conveying by mere emphasis to the reader's mind what was already superfluously plain to his companion's. Lower than this Dickens could never sink, nor, on the other hand, could he rise higher than Sam Weller and Little Dombey, for whose mental and moral shapes he performs exactly the same feat that we have described in his dealings with external eccentricities. Here it is that his imagination works most freely and abundantly, and here his greatest triumphs have been attained; but to throw into relief what he has done, we must remember what he never did, and never could have done. He was entirely incapable of describing or representing the inner nature or development of any character that he had not built up limb by limb for himself; and as he never happened to frame an ordinary mortal, those he intended for such were either entirely colourless, or a standing monument to his independence of aid from nature.

The Mystery of Edwin Drood may either be the subject of speculation as a novel, or of study as the last fragment from his fertile pen. In the first respect there are signs of a more carefully-designed intrigue than in most of his earlier works. John Jasper, opium-eater, music-master and murderer, is a villain of the melodramatic type, who is in love with his nephew's betrothed, and arranges, months in advance, how his nephew shall disappear and another young man be suspected of the deed. He has strange mesmeric power, and a remarkable gift of rehearsing in his visions, before and after the event, the crime which we are given to understand he has committed. As in Wilkie Collins's *Moonstone*, the mystery is evidently to be explained by the principal actor in a trance, and a mysterious woman who keeps an opium-shop for Chinamen and Lascars, lies vindictively in wait to betray him. It would be in vain to speculate whether Edwin Drood would have turned out somehow or other not to have been murdered, in spite of such omens as a heap of quicklime to consume his bones (p. 90), a black scarf of strong close-woven silk to throttle him (p. 112), and all the dreadful things that were evidently done while Durdles slumbered, and perhaps Deputy watched, on page 94. The solution of this problem was evidently reserved for the sagacity of Mr. Datchery, agent doubtless of Mr. Grewgious, seconded by the still unexplained animosity of the opium-seller. But Dickens was never very particular as to the possibility of the means by which his characters were made happy towards the last number, and for aught we can tell to the contrary, half-a-dozen principal contributors to the dénouement may have remained uninvented when the work was cut short in the middle.

Of the other personages, some have their individuality defined for them by mere outward accidents, as Edwin Drood by his testamentary betrothal, and others fall naturally into one of the many classes into which Dickens's shadow-world is divided. The charge of sameness and self-repetition in this respect, which is sometimes made against him, is rather unreasonable, for if we try to recall—it is no trifling task—the list of dramatis personæ in his collected works, nothing is more striking than the number of types it contains, except the distinctness of the several individualities which fall under each. In both respects nature is rivalled and in one way surpassed; for though five hundred persons selected with a due regard to variety might, in real

life, be as distinctly known apart as the same number of Dickens's most circumstantial inventions (a number easily made up), yet it is barely within the limits of possibility that a human author should delineate them *as they are* so as to give a complete and distinct idea of so many separate existences. Granted that Dickens represents them as they are not, painters have been proud of the title of "Nature's Ape," and if we take the words seriously, it is perhaps the fittest that could be given him. Whilst the impostors of real life pass half-hidden in the crowd, his Pecksniffs, Barnacles, Bounderbys, and Chadbands, with their absurd grimaces and wild contorsions, are mere caricatures; and yet their monkey-gestures are only the outside exaggerations of what we know must be passing in the mind of any humbug who is so successful as to have concealed every sign of his profession. Mr. Honeythunder, a philanthropist, is the contribution to this class in *Edwin Drood*, but he is brought in rather from the exigencies of the story than for his own sake, and some of his harangues look like padding. Besides a whole gallery of hypocrites, Dickens has favoured us with numerous personifications of cast-iron unamiability, such as Mr. Murdstone, Mrs. Clenham, and the rest, and with numerous personifications of jovial benevolence, sometimes in a whole family of Toodles, sometimes in a corpulent couple like the Boffins; aggressive with Mark Tapley, and latent, it may almost be said, with everybody who is not provided with some other leading and incompatible peculiarity. Mr. Crisparkle, in *Edwin Drood*, is the representative of this amiable fraternity, and he is also an amusing instance of Dickens's instinctive avoidance of commonplace possibility. What can be more natural and familiar than the idea of a private tutor, clerical and muscular, bathing, boxing, and exercising beneficial moral influence upon his pupils? and yet, whether because of his name, or his mamma, or the airs of unworldly wisdom with which he is invested, or some still less tangible reason, the good Minor Canon is no more like his supposed original than Dickens is like Miss Austen.

Then there are whole professional classes which Dickens has created over again, touching up the handiwork of nature where she seemed to have left life too dull a thing to laugh or cry at. The coachmen and ostlers of *Pickwick* are passing away, and the sailor on shore, here represented by Mr. Tartar (a gentleman who, for some inscrutable reason, prefers cultivating scarlet-runners in the city to taking possession of his property), always seemed to us the most mechanical and uninteresting of the author's fancies; but his landladies are admirable, and the sexless Billickin is a worthy successor to Mrs. Lirriper. This worthy's name suggests another class in which he excels, the ladies, namely, who express themselves incoherently, and lest Dickens's fertility in this direction should be perverted into a charge of self-imitation, it is fair to point out that in no case does this amiable weakness form the whole of a character, or else how should we distinguish Mrs. Gradgrind from Flora Finching, *née* Casby? There are many excellent people in real life whose names suggest first and principally the idea of discursive conversation, though they may have no other quality in common; and variety within variety is even more universally the rule with the novelist. Impecuniosity, or the Micawber or Skimpole type, does not appear in *Edwin Drood;* pompous imbecility is represented by Mr. Sapsea, an auctioneer; Miss Twinkleton represents the single ladies of a certain age whom we know so well, sometimes acid and sometimes mild, but always at feud with the nearest matron, who is also sometimes acid and sometimes mild. It is not to be expected that in the first half of a book, which was to be one of its author's shortest, we should find many of his favourite guardian angels of humble station, who are always ready to rush about in an unpractical way setting to rights impossible wrongs. There are no studies of insanity, nor any representatives of a particular abuse to be demolished; for love and opium-smoking, the principle motives of the story, cannot be compared with Bumbledom, Education, Chancery, Debt, and the other Giants who have been wounded with a drop of ink from his pen. The heroes and heroines are perhaps a little weak in drawing, except Rosa who quarrels and eats sugar-plums bewitchingly; but this may be because they attempt to be ordinary young men and women, whilst Dickens's forte is the extraordinary. It is certain that the only successful studies of character he has made are those which have been inspired by an abuse, and are a half-personification of its action and influence, like the Father of the Marshalsea or the younger Jarndyce. Durdles again is of the old comic breed; the imp known as Deputy seems too acute and malicious to have grown up in a cathedral city, but he might have been taken for a sketch from nature if it were not for his hobgoblin game of Wake-cock warning. It is not easy to say why such whims of the imagination are amusing, yet in virtue of them Dickens is to the Briton exactly what a story from the *Arabian Nights* is to the Oriental; it is the invention of a single man against the memory of a generation of grandmothers.

On the whole *The Mystery of Edwin Drood*, viewed as a fragment, shews little falling off from the writer's second-best works; the unfortunate cause of its fragmentary form lends it a peculiar interest, and we welcome these new actors the more because they are the last who will join the company. But after assigning them their places, there is room for a word on the moral and intellectual atmosphere which pervades and surrounds them. The first thing that strikes a reader of Dickens is the absence of all familiar boundaries and landmarks: class distinctions are ignored or obliterated; different ages and sexes assume the prerogatives of their opposites; people transact incongruous business in impossible places; and with it all there is no apparent consciousness that the social order is confused and inverted. It is still more curious to watch this levelling tendency applied to matters of intellect. Dickens has a positive affection for lunatics, and with the exception of the favourites to whom he lends touches of his own imagination, a vast majority of his characters are born fools. In his queer world they fare none the worse for this; they cluster round one delusion or another, and defend it with just as much formality as if they were reasoning beings, and it almost seems as if, *cæteris paribus*, he preferred the thought that travelled by a crooked lane. The only light in this chaos is what falls from a few moral axioms concerning the duty to our neighbour, and these are of such universal application as to be rather indefinite. In such books as *Dombey* and *Martin Chuzzlewit* we seem lost in a millennium of illogical goodwill, in imagining which, no doubt, Dickens was principally influenced by his natural humour. But the only approach to an opinion on things in general that can be gathered from his works, is derived by implication from his moral system. The world, we are given to understand, would be more amiable than it is, and could not be more absurd, if the virtues of Mr. Toots were universally practised. This is by no means a bad position for a humourist to occupy, for though we may have our doubts as to what makes Dickens's characters so much more laughable than life, it is something to have extracted the maximum of amusement out of innocent and even admirable eccentricities.

H. Lawrenny.

Political Ballads and Poems of Germany. [*Die historischen Volkslieder der Deutschen vom* 13. *bis* 16. *Jahrhundert*, gesammelt und erläutert von R. Liliencron. Auf Veranlassung und mit Unterstützung seiner Majestät des Königs von Bayern Maximilian II. herausgegeben durch die historische Commission bei der königl. Academie der Wissenschaften.] Leipzig: F. C. W. Vogel, 1865-1869. Fünf Bände.

It would be superfluous to insist here upon the very great importance of political ballad-poetry and popular songs. That the multifarious value of compositions of this kind is amply recognized, appears from the numerous collections or fresh editions of them which have been recently undertaken in England, Sweden, Denmark, and Germany. Of all those which have hitherto appeared, the one before us is the most comprehensive: although extending only to the middle of the 16th century, it contains 623 pieces, and that without including the Church poetry of the Reformation, which would have belonged to the last period of the collection, but that Liliencron intends to make separate use of it hereafter. This abundance of material is sufficiently surprising, but it is explained not only by the productivity of an eventful time (about 370 pieces are concerned with the interval from 1506 to 1554), and by the circumstance that Switzerland and the Netherlands—and therefore the songs of those countries—then belonged to Germany; but also by Liljencron's having included in his work certain rhymed pieces (Spruchgedichte) which were never intended to be sung. In answer to criticisms on this score, he observes that poems of this class undeniably form part of the material which he had undertaken to collect, though they have the effect of making the title "Popular Songs" unsuitable to the collection. "Political Poems of the People" would be more accurate, but on the whole, he preferred the familiar name. The same view was taken by Hyltén-Cavallius and George Stephens, who admitted several pieces of this kind into the *Sveriges Historiska och Politiska Visor* (Örebro, 1853), an excellent collection, of which, unfortunately, only the first volume has as yet appeared.

The only two qualifications for admission into this collection are, therefore, that the poem under discussion should have sprung up amongst the people or the itinerant poets of the people, and secondly, that it should be of the same date as the occurrence it commemorates; whence it follows that pieces of later origin, composed by the help of chronicles or such like authorities, are, with few exceptions excluded. Similarly, only those poems of a narrative form are admitted which were composed under the impression of the moment, and aim less at narrating and describing than at influencing the popular mind by a coloured and more or less partial account of events. The collection closes with the year 1554, the date of the last events of the first religious war in Germany, forming thus a complete and satisfactory whole; for there already exist abundant collections for the period of the Thirty Years' War, although the political poetry of this as of the intervening time has a character of its own.

In the songs and verses of these three centuries, we see how the people of the time expressed the feelings and opinions which each fresh occurrence called forth from the exhortation to union addressed to Berne and Friburg in 1243, and the battle on the Marchfeld (1273) in which Rudolph of Hapsburg laid the foundation of the greatness of his house, till that battle of Sievershausen at which Maurice of Saxony, the author of the Peace of Passau, was slain 1553. Amongst these, to take a few of the most familiar points, we find songs from the time of the frightful Hussite wars, of the Swiss struggles against Austria and Burgundy, of the great peasant war, of the Munster Anabaptists, of the first siege of Vienna by the Turks, of the war of the Schmalkald league and its consequences down to the treaty of Passau. Here we can trace the struggles between the towns and the princes, and within the former between the patricians and the guilds; here too we are met by those mighty burgomasters of the free imperial towns, who so often played an important part, like Schwarz and Herbrot in Augsburg (1477 and 1548), Waldmann in Zurich (1489), and more particularly Wullenwever of Lubeck (1534), the area of whose influence extended far into the North of Europe.

It is evident, from the first glance, that the work before us is as important as it is attractive, and the merit of the editor is not less conspicuous in the manner in which he has carried out the honourable task which has fallen to his share. We must call to mind the long and laborious researches (involving the help of many experienced assistants) which were necessary in collecting materials scattered through public and private libraries, and sometimes entirely lost sight of, which then had to be sifted, arranged, and subjected to philological criticism. In addition to this, the editor was aware that the complete enjoyment of poems of this kind was impossible without previous knowledge of all the circumstances of the time which gave rise to them; and he has accordingly prefixed to each poem an explanatory introduction of sufficient length, whilst for points of detail, verbal explanations, and various readings, the student is referred to accompanying notes. As all this has been done with the greatest care, the most minute knowledge of the subject, and the most extensive learning, it can easily be imagined what an amount of labour Liliencron has bestowed on this extensive work. The same consideration explains how here and there a trifle should have escaped his notice, or an inaccuracy have been overlooked; as when he explains the expression "Kunst noctoria" by the non-existent "ars unctoria" (i. 239, No. 50, v. 653), when what is meant is the "ars notoria," for which see my edition of *Gervasius of Tilbury* (Hanover, 1856), p. 161; or when he does not observe that "Grippe" (iii. 39, No. 261, v. 105) is the Italian "grippo," cf. Spanish "gripo," or when he transfers the "Kneiphof" (iii. 517, 36) from Königsberg to Dantzig. These, however, are trifles, and there is only one point on which I want to dwell a little longer, the song, namely, exhorting Berne and Friburg to unity, which is referred to the year 1243, because of the alliance then concluded between those towns. It is related, in an allegorical form, how two oxen had made themselves sole masters of a clover-field, and had compelled all the other beasts to remain at a distance from it. These, however, and especially the wolves and the foxes, endeavour to disturb the good understanding of the oxen in order to overcome them separately, and thus take possession of their pasture-ground. The author of the poem, on the other hand, warns the two oxen ("Es ist Friburg und Berne") against these suggestions, as they are able to resist all attacks whilst united, but would succumb separately. This song has been printed more than once before, but neither Liliencron nor any one else has yet remarked that it contains an allusion to the eighteenth fable of Avianus, which tells of four oxen, whom the lion first disunited, and then overcame. Boner has modified this fable in his collection (No. 84), retaining the four oxen, but making the lion into a wolf. He was a native of Berne, and wrote in the first half of the 14th century, and it is by no means improbable that the author of the poem under discussion may have borrowed his allegory from Boner's fable; both alike differ from Avianus in making the enemy a wolf, and Liliencron himself points out that the language seems to indicate a rather later date than that hitherto accepted. Alliances between Berne

and Friburg were concluded in 1307 and 1313, as well as later, and the poem might refer to one of these instead of to that of 1243. But in the song on the Battle of Sempach (i. 119, No. 33, 4, ff.) Avianus' lion reappears, for the allusion is to him, rather than, as Liliencron supposes, to the Order of the Lion, of which Leopold of Austria was a member; and, consequently, the four original Cantons, Lucerne, Uri, Schwytz, and Unterwalden, must be understood as the four oxen of the fable.

As I am on the subject of Liliencron's very welcome and instructive introductions, I should not omit to notice that the poems belonging to the Peasant War might also with advantage have been accompanied by an introduction, not, of course, exhaustive (for none are), but still better than nothing. That to No. 454 (on Wullenwever) occupies four pages and a half, and one or two pages more would have sufficed for a summary of that war. The rigorously conservative prepossessions which Liliencron betrays whenever there is an opportunity, need not have prevented him from doing justice to the poor tortured hinds and their lawful demands: out of more than twenty pieces (284–286, 374-393), only two come from their camp, whilst all the others proceed from their enemies; so that there would be little chance of forming a fair judgment of their despairing struggle, unless we possessed other sources of information. A word of defence, or at least a short account of the course of the insurrection, would have been quite in place: the reference to Zimmermann's History is not enough, because that work may not be in the hands of all educated readers, for whom, of course, the present collection is intended. For the rest, the history of this war is even now full of profitable instruction, and, as the French would say, "pleine d'une actualité palpitante," especially for England. We have just remarked that only two songs on the side of the peasants have reached us; all the others were probably suppressed by the victors, or else had never spread beyond a narrow circle, or perhaps concealed their meaning under an allegory, like the fine expressive song of the Danish country-people, which extolled the "eagle (Christian II.) who smote the hawk" (the nobles and priests) "with his sharp claws, so that all the other little birds rejoiced, and each one began to sing." Of course, this too is a party song, but it gives at least an indirect expression to a voice, then seldom heard, that of the people groaning under the yoke of the nobles: and Svend Grundtvig rightly remarks (*Danmarks Gamle Folkeviser*, ii. 667), "Even if the song does not tell the whole truth, or express an impartial judgment, nevertheless, as Afzelius says, it is truer than chronicles, and more precious than gold."

Many of the songs and introductions have a special bearing on and interest for England. As early as the year 1375 we find *Ein Lied von den Engelschen* (i. 87, No. 25), where the march is described of the dreaded Welshman Jevan ap Eynion ap Griffith, with the army of Ingelram de Coucy to Switzerland; further on in the year 1513 we find *Ein neuw Lied von der groszen Niderlag geschehen vor der Stadt Terwan* (*Terouanne*), *durch unsern allergnädigsten Herrn den Kaiser und Künig von Engelland wider den Künig von Frankreich* (iii. 100, No. 277), and so with many others, as may be seen from the careful index of titles appended to each volume, which, however, now that the work is completed, would be more convenient if thrown into one. Nothing essential is however wanting to the collection, for in the preface to the first volume the editor has explained the historical and philological principles by which he has been guided throughout; a short review of the history of popular poetry shows his deep insight into its nature, and to complete the work, the last and fifth volume contains a historical account of the popular music of the 16th century, together with the tunes for as many of the songs as can be found. By a fortunate chance the song on the murder of the famous burgomaster of Ghent, Jacob van Artevelde, the ally of King Edward the III. of England (A.D. 1345) has been preserved by oral tradition, with the appropriate melody, down to the present time, and is here printed (appendix 4). With this interesting detail we must take leave of this most valuable collection, recommending it at the same time to students of history and the friends of popular poetry. FELIX LIEBRECHT.

Alpine Flowers for English Gardens. By W. Robinson, F.L.S., Author of *The Parks, Promenades, and Gardens of Paris.* With numerous Illustrations. London: J. Murray, 1870.

The Wild Garden, or our Groves and Shrubberies made beautiful by the naturalization of hardy Exotic Plants; with a Chapter on the Gardens of British Wild Flowers. By W. Robinson. London: J. Murray, 1870.

"THE choice jewellery of vegetable life," as Mr. Robinson aptly designates the family of alpine plants, forms one of the great charms to the mountain traveller. Who can describe the delight, on ascending above the level of the trees and bushes of the plain, at the first sight of the pigmy Primrose (*Primula farinosa*), with its graceful lilac flowers, its silvery leaves, and slender powdery stem, or of the vernal Gentian (*Gentiana acaulis*), with its flowers of vivid purple of peerless beauty—a gem-like triumph of life over death, buried, perhaps, for eight months out of the twelve in shrouded snow. Then there is the Cushion Pink (*Silene acaulis*), with its tufted masses, like wide-spreading moss, a cluster of crimson flowers peeping above its leaves, making lovely carpets where all around is desolate, the Rose of the Alps (*Rhododendron ferrugineum* and *hirsutum*), the Sedums, Saxifrages, Campanulas, Pinks, and a host of others, the memory of which stamps itself as deeply upon the mind of the traveller as the snowy waste or the silvery waterfall, specks though they are in comparison with these. The first impulse of the tourist is to dig up these little treasures, and transfer them, as memories of foreign lands, to his garden at home, where, carefully inserting them in the sunless chinks of his clinker rockery, these children of air and light soon wither and die.

The object of Mr. Robinson's little work is to shew that, under proper treatment, "there is no alpine plant that ever charmed the traveller's eye with its brilliancy, that cannot successfully be grown in these islands." Though, in their natural habitation, they are every year covered with deep beds of snow, or fringe vast fields of ice at elevations where they have scarcely time to flower and seed before they are again embedded, yet these conditions are not indispensable to their growth. In the plains and low-clad hills, these little plants are generally overrun by trees, bushes, and vigorous herbs, while in the more elevated regions there is no taller vegetation to stifle them—they have it in fact all to themselves. But if elevated regions are not indispensable to the well-being of alpine plants, full exposure to the sun, abundant moisture and depth of soil are essential conditions to their existence. The great obstacle they meet in garden-cultivation is a false conception of their requirements, and of what rockwork should be. Because they inhabit the interstices of the crag, it is an error to suppose they exist upon little more than melted snow and mountain air, or to imagine they are growing in mere cracks destitute of soil. So deeply rooted are they in the heart of the flaky rock, that after patiently knocking away the sides, Mr. Robinson succeeded in laying bare the roots of a tiny plant, not one inch in height, and found some of its radiating fibres to extend more than three feet in length. The broken stone, sand, and grit tend to prevent evaporation and to create drainage, and allow the roots to penetrate deeply among the fissures, so that they never suffer from want of food and moisture.

How can this set of conditions be said to be copied by stuffing a little mould between the clinkers, "jammed" bricks and cement of a rockery of ordinary construction, and cramming therein a delicate alpine plant, with no room for its roots, probably under the drip of an overhanging stone, which shuts it out from sun and air.

The aim of Mr. Robinson is to correct the whole system of rockwork and rock-gardening, of which he clearly exposes the errors, shewing how the masses of rock should be disposed to form a rockery, assimilated to the natural habitations of alpine plants. He describes the various collections in England, where they flourish in full vigour—convincing proofs that they may be successfully cultivated and acclimatized. The interest of the volume is much enhanced by a lively description of a tour made by the author, in order to see some of his favourite plants growing in a wild state. He ascended the Grande Salève for the silvery Saxifrage, and saw Gentians of the deepest blue in silky beds of Cudweed. In the dark valley of the Saar, he found countless tufts of the interesting Cobweb Houseleek, caves with a golden lining of the yellow Violet and crested with the Alpine Rose, the rare glacial Ranunculus flowering near the sea-green arch of a glacier; and after a diligent hunt on the top of the Monte Campione, he eventually succeeded in finding the rare Elizabeth's Catchfly. The second part of the book consists of an alphabetical list of alpine plants, with directions how to cultivate and increase them. The work is written with all the enthusiasm of a genuine lover of plants, and is full of invaluable practical information on the subject upon which it specially treats.

Closely following on his *Alpine Plants* Mr. Robinson has published *The Wild Garden*, a work in which he takes a general view of the flower-garden ancient and modern. He strongly deprecates the artificial and formal floriculture of the "bedding out" system, in which all energy and experience is devoted to the production of thousands of plants, tender and tropical, solely for summer decoration—"the best possible appliance," he says, "for stealing from nature every grace of form, beauty of colour, and vital interest"—covering the beds for a short season with gaudy masses of colour, and leaving them bare during the rest of the year. This fashion has also produced the evil of eradicating all our sweet old-fashioned flowers, from the stately Lily to the dwarf Hepatica, which adorned the mixed borders of our ancient gardens, and which are now alike dismissed even by the cottager-florist, to give place to Geraniums and tender exotics. Mr. Robinson proposes a plan by which more of the beauty of hardy flowers may be exhibited, than by either the old or modern system. He suggests that the belts of shrubberies, and the rough or semi-wild parts of a garden, should be filled with hardy plants, and that they should there be allowed to grow wild and unrestrained, so that the naked earth should never be shown, but be carpeted by dwarf shrubs, among which the herbaceous plants should rise and bloom in their own wild way. Many flowers, insignificant as single specimens, are of the highest order of beauty when seen in numbers, and these plantations would be attractive in all seasons; whereas a simple border of herbaceous plants, when out of bloom, presents only bundles of decayed stems tied to sticks for support. Mr. Robinson would also dot the lawn with dwarf bulbs and spring flowers, which are seen to greater advantage in their emerald bed than in the border, and would have blossomed before the scythe of the mower cropped them off.

The concluding parts of the work contain an enumeration of hardy plants suitable for shrubberies and wild borders, for hedge-banks, rockwork, walls, &c., arranged also according to the soils best fitted for them; and the work closes with a chapter upon British wild plants, and the way to cultivate them.

F. Palliser.

A Critical Account of the Drawings by Michel Angelo and Raffaello in the University Galleries, Oxford. By J. C. Robinson, F.S.A. Clarendon Press, Oxford.

Raphael Sanzio and Michel Angelo Buonarotti. Burlington Fine Arts Club Catalogue, 1870. London.

Mr. Robinson has accurately described his book in its title. He does not give us a catalogue, but a critical account, of the drawings by Michel Angelo and Raffaello at Oxford. It is not the first time that Mr. Robinson has brought to bear the wide experience which he has acquired as a collector on undertakings similar to this. His *History of Portuguese Art*, and his *Catalogue of the Collections of the South Kensington Museum*, have long been before the public, and on reference to the catalogue of the collection of drawings by old masters at present in the Burlington Fine Arts Club, it will be seen that the very adequate descriptions of the drawings lent by Mr. Malcolm, of Poltalloch, are extracts from Mr. Robinson's admirable catalogue of that collection which, through the liberality of the author and Mr. Malcolm, has been widely though privately circulated. The drawings of the sixteenth century are now all in known hands or gathered together in public galleries, so that the work of the collector being done, the work of the critic can begin. Examination, comparison, and correct arrangement were impossible as long as these drawings were sown broadcast over Europe, or hidden away in neglected portfolios. Under such circumstances the bald and meagre catalogue, barely sufficient for the purposes of sale, was all that was practicable, but now the catalogue, to be of any value, must claim a place in the literature of Art. Such is the character of Mr. Robinson's *Critical Account*; it is a book which must in future be consulted by every one who makes the lives and works of Michel Angelo, and Raffaello, the subject of study and investigation. The notes on Michel Angelo are almost entirely new, and in respect to that portion of Raffaello's work which is represented by the contents of the University Galleries, Mr. Robinson has entirely superseded the cursory and often careless remarks of Passavant. The successful accomplishment of a task such as this requires both taste and learning, for each drawing has to be considered not only as a work of art, but as a piece of evidence which may throw light either on the biography of the artist or the history of his work. On this head Mr. Robinson's book fully satisfies the strictest requirements. He has arranged the drawings chronologically; that is to say, he has grouped together all the studies which clearly relate to any given work in its early and late stages, and has placed each group in carefully ascertained order. There are then remaining drawings not known at present to have any connection with extant finished work. These having been sorted, by strict technical examination, each set is placed in the neighbourhood of that group of sketches to which it appears by its technic to have most affinity. To each drawing is appended not only a most accurate description, the full value of which students alone will appreciate, but its complete history. We can learn at once whether there exists a repetition, if so, of what size and where; whether it has been engraved, if so, by whom; and wherever the authenticity is doubtful, Mr. Robinson weighs the question in honest and well-considered critiques, besides giving in every instance straightforward references to the work of his predecessors.

The Appendix is very full, and all connoisseurs will welcome the list and the engravings of watermarks, and the publication of the 17th-century Antaldi Catalogue presented to the Galleries by Dr. Wellesley, and now for the first

time printed in Note 17. It will be seen that to treat upwards of three hundred drawings in this exhaustive way must have involved great and patient labour. But it has been labour well rewarded, for in more than one instance Mr. Robinson has made what may be almost termed discoveries. For instance amongst the drawings previously withdrawn from exhibition at Oxford as unimportant, he has identified a study for the lost picture of the "Crowning of S. Nicolas of Tolentino," one of Raffaello's chief early works. Up to this moment it has been supposed that a sketch in the Wicar collection at Lille was the only existing record of the destroyed painting; but now, thanks to Mr. Robinson, the hitherto neglected Oxford study takes its proper place. The paper is drawn on both sides: on the one there is the standing figure of an angel, the figure of a saint, or ecclesiastic, and a study for the left hand and arm of a figure holding a crown; on the other side are various studies of hands and arms relating to the same picture. The sketch is of the more value as the picture was never engraved; and although inferior in interest to the Lille drawing, yet, taken in conjunction with it, it not only affords a tolerably correct idea of the composition as a whole, but gives affirmative evidence as to the introduction into the picture of a figure of S. Nicolas of Bari hitherto attested only by a doubtful assertion in Pungileoni's *Elogio storico di Raffaelle Santi*. Two of the Michel Angelo series have long been described as studies for portions of the Pisa Cartoon; to these Mr. Robinson adds three more, making a set of five in all, having well-grounded claims to be considered as studies preliminary to the execution of the cartoon. They are of unequal value as drawings, but one, No. 16, a furious combat of cavalry and foot-soldiers, is instinct with the master's terrible vigour, and issues out of those mysterious shadows peculiar to Michel Angelo, which allure the eye with a strange half-awful charm. All these Oxford sketches are however, but for subordinate portions of the cartoon. The principal group is only preserved to us in the prints by Marc Antonio, Agostino, Veneziano, and that by Schiavonetti, from the chiaroscuro picture at Holkham. In Note 3, Mr. Robinson recalls these facts to us, and enriches them with comment and illustration. He shares the dream of every enthusiastic student of Michel Angelo, that some day the lost portions of the great cartoon will be recovered, and encourages us to believe that at any rate we are not at the end of possible discoveries, even though the crowning triumph be deferred.

In respect of the Medici Tombs, and concerning various other points, a great quantity of new and interesting details will be found in this *Critical Account*, but no part of the work is more worthy careful examination than the comments on the sketches referring to the Vatican frescoes. The inferiority of those on the ceiling in the chamber of Heliodorus has been often a subject of remark. Mr. Robinson attacks their authenticity, and employs the testimony of the Oxford studies with much ingenuity in support of his position. Any one may be easily convinced by slight examination, that neither the design of the "Almighty accompanied by Angels" for the fresco of the Burning Bush, nor the weaker drawing for the Sacrifice of Abraham, both ceiling frescoes in the chamber of Heliodorus, are by the hand of Raffaello, and Mr. Robinson is probably correct in his attribution of them to Giulio Romano. But it is difficult to see in No. 94 catalogued as "Study for one of the flying Angels in the fresco of Abraham's Sacrifice," a "strong impress" of that artist's manner; and its close resemblance to the angel who supports the drapery on the left hand in the Madonna del Baldacchino, suggests that it may possibly be one of the early pen-drawings of Raffaello himself. There is also amongst the Raffaello series the fragment of a cartoon representing a crucified left hand and arm. Passavant has noted it as a copy, and calls it "Fragment des Cartons der Schlüsselübergabe." But in the Charge to Peter we see only the backs of both the right and left hands, whilst here we have the inside of the open palm, the drawing cannot be therefore that which Mr. Robinson following Passavant has supposed it to be. It is suggested that the study may be a portion of the cartoon of the Resurrection for the fifth tapestry of the second series, possibly from the hand of Giulio Romano. The action resembles so closely that of the uplifted right arm of the Christ issuing from the tomb, that it induces the supposition that the composition was reversed for working. But this cannot be positively asserted, for at present even the name of the author of the design in question remains in doubt.

The mere fact that these are the only two points in a work of such extent which can be found open to question, is in itself a testimony to the scrupulous exactness with which the entire undertaking has been carried out. The strictest requirements have been fulfilled. Prefixed to the Catalogue are chronological summaries of the lives of Michel Angelo and Raffaello, which will be found extremely useful for reference by those who are making a critical examination of the drawings, and the Introduction contains a valuable account of the history of drawing collecting in England from Charles the 1st and the Earl of Arundel down to the dispersion of the unrivalled gatherings of Sir Thomas Lawrence, a portion of which constitutes the collection at Oxford. An unpublished sonnet by Michel Angelo will be found in the Notes, which occurs on a sheet of studies presumed for the Pisa cartoon. In short, Mr. Robinson has left nothing undone. Ample materials for work and investigation, both in respect of criticism and archæology, are provided for the student in this unpretending volume, and he will find that in most cases the notes rise far above the usual level of a book of reference.

E. F. S. Pattison.

A Conference of Pleasure, composed for some festive occasion about the year 1592 by Francis Bacon. Edited, from a MS. belonging to the Duke of Northumberland, by James Spedding. London: Longmans, 1870: xxxi. and 54 pp. 8vo.

This book consists of four imaginary speeches, about 30 pp. long, with a preface and notes copious rather than elaborate, but interesting enough.

The speeches are in praise of fortitude, love, knowledge, and Queen Elizabeth; they can hardly be called anything but rhetorical exercises, in the common form of the time, and (except the last, a review of its heroine's character, policy, and fortunes) not so much an expression of Bacon's opinions as dramatic.

The last two were published by Stephens in 1734 from a m.s. of Lord Oxford's (now quoted as Harl. m.s. 6797); the others have not before been printed. The duke's m.s., better than the Harleian, was brought to light by Mr. Bruce in 1867. It has had its edges burned, and the editor has restored many of the words so destroyed by ingenious and learned conjectures, and with such a typographical arrangement that it is easy to judge of their probability. He has also emended several passages in the Harl. m.s. The Northumberland House m.s. he has printed entire.

Here is his emendation of one passage, missing in the duke's m.s.: "The castell of Edenborough . . . wth place [*m.s.* with place] incontinently, without cunctations or cavillations (the preambles of a wavering fayth), she rendered with all honour and sinceritie [*m.s.* securitie]" (p. 20).

Here are two passages restored by conjecture in the Northumberland House m.s., "I seeke b[ut an euen] tenor

of minde" (p. 5). "No p[erson ever saw] at any time the minde of another but in love" (p. 11).

It seems to be taken for granted, though not by Mr. Spedding, as his introduction (p. xxxi) shews, that anything which can be fathered on Bacon was not only written but invented by him, and has an intrinsic value. Such an assumption resembles one which would give Locke a monopoly of political speculation, or Addison a monopoly of moral, or make Warton the only critic of his day. These distinguished writers are of course only representatives of the students of the hour, admirably as they represent them, and given works of theirs may as fairly be treated as *sui generis* as given articles in to-day's paper. R. Robinson.

Intelligence.

The Text of Chaucer.—In the *Edinburgh Review* for July is a most valuable article on the text of Chaucer, containing *inter alia* explanations of obscure terms employed by the poet. From four of the collected texts a final correction is derived for a line in the description of the Temple of Mars (*Knight's Tale*). The Harleian text reads,

> "And therout came a rage *of suche a prise*."

The passage in the MSS. runs thus,

> "There stood the tempul of Mars armypotent,
> Wrought all of burned steel, of which the entree
> Was long and streyt and gastly for to see,
> And therout came a rage *and suche a vese*,
> That it madd al the gates for to rese."

The writer shews that *vese* (glossed *impetus*) is the appropriate word, and explains the meaning of the lines to be "that the furious blast issuing from the temple shook its ponderous gates of adamant and steel." The word—spelt indifferently vese, vise, feese, fiys—comes from A.S. fýsan, *properare*, and especially expressed the rapid and noisy movement of water. Thus Wycliffe, note to John v. 4, characterises a standing pool as water "gaderid togider havinge no fiyss." The comparison of the din of arms to the din of a torrent was familiar both to mediæval poets, and to Virgil (*Æn.* ii. 305; xii. 523). The passage before quoted, with the preceding lines, seems to convey the idea of confused martial discords, which, as they pour through the narrow gateways with the sound and fury of torrents pouring through straits, meet the outside storm. And the conflicting clash of wind and wave-sounds adds force to the implied image, that of the opposing rush of hostile armies. We are indebted for this suggestion to Mr. G. Waring.

Ambrose Bonwicke.—The life of Ambrose Bonwicke, edited by Mr. J. E. B. Mayor, may be expected to appear in the course of November. Besides a reprint of the life written by his father, from the edition of 1729, the volume will contain illustrations of the influence of the Jesuit text-books at Cambridge, and of the course of University studies; authors now so little read as Hierocles and the Golden Verses, seem then to have been part of the staple of instruction, as well as more valuable authors like Quinctilian, now equaliy neglected. The mode of living was still very primitive, it was part of Bonwicke's duties as a scholar to wind up the college clock, and the institution of "bedfellows" was still in vigour. The above will form the first volume of "Cambridge under Queen Anne:" the second, which will not be ready until after Christmas, will contain accounts of the visits of Burmann in 1702 and Offenbach in 1710, showing, among other things, how one distinguished foreign scholar attended a bear-baiting, and another congratulated himself on the absence of Bodley's librarian, who would have exacted a fee of a guinea while his subordinate was content with ten shillings.

The Library at Strasburg.—We fear the laconic telegraphic announcement that the Library at Strasburg has been entirely destroyed, is but too true. We have written to Heidelburg to make more minute enquiries, but have not as yet received any reply. According to Schweighäuser's account published in a recent number of the *Bibliographie de la France*, the Library contained the collections of Schoepflin, the national historian of Alsace, and large gatherings from the monasteries destroyed at the time of the Revolution. The greatest curiosities were the *Hortus Deliciarum* of the Abbess Herrade of Landsperg, a folio MS. of the 12th cent., with miniatures on almost every leaf, and the volume containing the depositions in the lawsuit between Gutenberg and the brother of his partner Dritzohn, 1439. Many rare works of the early Strasburg printers have also perished. In the entrance of the Library some of the Gallo-Roman antiquities are capable of restoration. The picture-gallery in the Platz Kleber is also destroyed: beyond a capital Ostade nothing of great value. It is strange that the most precious volumes, at least, of the collection were not put into a place of safety. The Librarian, Zeller, has made a most earnest appeal for replacing the lost books. We ought to add that the *Times* correspondent obtained his information about the total destruction of the library from no more authoritative source than the principal bookseller in Strasburg; and that there is, therefore, still room for hope that the worst is not true.

During 1869 the British Museum was increased by 32,013 volumes, including 1100 Chinese works, a magnificent map of the world of the fifteenth century (1457), executed for Prince Henry, the navigator, by the celebrated Venetian cosmographer Mauro, and a French MS. of 1300, enriched with miniatures, *La Somme le Roy*, by the confessor of Philip III., Brother Laurent. The Museum authorities are preparing for immediate publication the catalogue of pamphlets and satirical works printed in England from 1537 to 1688, and the third volume of the cuneiform inscriptions.

Mr. W. W. Story has in hand a work on the history of the Castle of St. Angelo at Rome, and in contemplation a tragedy on a Roman mediaeval subject—the loves of Otho and Stephania.

Mr. Swinburne has been for some time engaged on the *Legend of Tristan and Yseult*. The poem turns largely on the contrast between mediaeval Christianity and ideal human passion.

Mr. W. B. Scott is supplying the critical text to an illustrated work on French artists shortly to be published.

Mr. G. H. Lewes has entirely rewritten his chapter on Hegel for a new edition of his *History of Philosophy*.

Selected Articles.

Scritti inediti di Torquato Tasso, by Attilio Portioli. [They consist of twenty-nine letters, some only a few lines long, two sonnets, and a madrigal found amongst the historical documents of Mantua. The letters are mostly of later date than Tasso's imprisonment, and show an irritability, like Rousseau's, which would have made his life a melancholy one under any circumstances. To these are added one or two other unpublished letters to or about the poet, including one from Bernardo Tasso, telling how his son was nearly burnt to death in 1567, from reading in bed.]—Rivista Europea, July.

Della Tavola di nostra Donna nel Tabernacolo di Or San Michele. Gaetano Milanesi. [This picture, formerly attributed to Ugolino of Siena, is now placed amongst the best works of the middle of the 14th century. Two memoranda (bearing date 1346 and 1347) of payments to Bernardo Daddi (a pupil of Giotto, fl. 1300–1350) for painting "la tavola *nuova* di nostra Donna," suggested to Sig. Milanesi that this work replaced the original Madonna mentioned by Villani, which stood on a pillar in the loggia, then used as a corn exchange. Sig. M. has already assigned the portrait of Dante, known as Giotto's, to this same Daddi, whom he also identifies with a "Bernardo of Florence;" and as some contemporary notices seem to show that the latter was sometimes confounded with Nardo Orgagna (Nardo being short both for Bernardo and Lionardo), he goes on to attribute to him the famous frescoes of Hell, the Judgment, and the Triumph of Death, in the Campo Santo of Pisa; adding, what is certainly true, that if these suppositions were correct, Bernardo Daddi would rank among the first artists of his age.]—The same.

Bastiat, J. E. Cairnes. [Bastiat's theory of value was directed against Socialism, and he is hampered in his reasoning by the foregone conclusion "that, left to themselves, human interests are harmonious." Though he claims to be the first to maintain that natural gifts have no *value*, whatever their utility, he defines value as the "relation of two services exchanged," expressly because the word *service* may be understood either of the benefit conferred or of that received. He admits that the one may be out of all proportion to the other, and does not see that this can only arise from the natural advantages, which he does not recognize as an element of value.]—Fortnightly Review, Oct. 1.

Ancient Japanese Poetry. [Japanese verse is for the most part lyric or descriptive; it is of two kinds, "Shi," of Chinese origin and structure, and "Uta," of purely native growth. The latter consists of lines of five and seven syllables variously arranged, and to fill up the metre meaningless terms called "pillow-words" (like the French *cheville*), are used at discretion. Some of the Ko-uta, or minor poems, translated express a simple image gracefully; the earliest date from before the 9th century, A.D.]—Westminster Review, October.

Joan of Arc, by L. [A new and valuable metre: the thoughts and imagery recall Swinburne, Tennyson, Morris, and Browning, unmistakeably and pleasantly: the general conception, though obvious, is elevated.]—Same.

Florence from 1200 to 1345, by P. N. Müller, in De Gids, Sept. [A sketch of the commercial history of Florence, based on a recent work by the Commodore Peruzzi, and containing some details of interest on the relations of the English kings with their Italian bankers.]

Theology.

The Fourth Gospel: An Attempt to ascertain the character of the Fourth Gospel, especially in its relation to the Three First, by J. J. Tayler, B.A. 2nd ed. London: Williams and Norgate.

The first edition of this work was published in 1867; the present is posthumous. Mr. Tayler had intended (so Rev. J. Martineau says in his preface) to enlarge the book, but nothing was found sufficiently connected for publication. The only insertion is a long small-print note on the Paschal Controversy, mainly concerned with Hilgenfeld's researches. Mr. Tayler was thoroughly acquainted with the state of the question up to within a recent period, and it should be remembered that the original preface designedly omits reference to the later literature on the subject in order to present the conclusions arrived at in a more independent way. From many points of view, this was a distinct advantage. To it we probably owe something of the freshness which is striking in the work of "a green old age." But there are some drawbacks to be set on the other side. The controversy has to some extent shifted its ground from the point at which Mr. Tayler took it up; and the consequence has been, that while all that he has written is of value in itself, it is apt to be less strictly relevant in the aspect which the question is now assuming.

Thus there is significance in the way in which Mr. Tayler's argument is distributed. Omitting the last two chapters, one of which is a recapitulation of what has gone before, and the other treats of the wider religious bearings of the question, we have a total of 142 pages. Of this we may say that 45 are devoted to a consideration of the relation of the Gospel to the Apocalypse, 34 to a consideration of the external testimony to the Gospel itself, and 43 to the Paschal Controversy, leaving 9 for an introductory statement of the question, and just 11 for the examination of "internal indications." Now if we turn from Mr. Tayler to some of the more recent writers upon the same subject in Germany—such, for instance, as M. Wittichen (*Geschichtliche Charakter des Evangeliums Johannis;* Elberfeld, 1868), or Dr. Keim (*Geschichte Jesu von Nazara*, pp. 103–172; Zurich, 1867), the contrast which they present is considerable. In these the Paschal Controversy disappears altogether. The Apocalypse is mentioned only to be dismissed. The external evidence is reduced in one case to a little more, and in the other to a little less, than one-seventh of the whole matter, and the remainder is occupied entirely with an analysis of the Gospel, either of its language and style, or of its theology, or of the historical narrative which it contains. In other words the importance attached to these branches of the argument by Mr. Tayler on the one hand, and by MM. Wittichen and Keim on the other, is in the proportion of 1-13th to 6-7ths, or about 1 to 10.

This change of treatment has not been without its reasons. The Paschal Controversy has dropped into the background because it is seen to be inconclusive. If we allow to the traditions of the second century an authority which they hardly possess, there are still too many possibilities intervening between the premiss that St. John observed the 14th Nisan, and the conclusion that he cannot have represented the Crucifixion as taking place upon that day. We may, if we please, accept the far from improbable theory of Bleek that the Christian celebration grew immediately out of the Jewish Passover without reference in the first instance to the Last Supper. And this theory would only be confirmed, if we thought with Dr. Keim that the date assigned to the Crucifixion in the Fourth Gospel was a deliberate transposition in order to identify it with the sacrifice of the Paschal Lamb. At any rate the tendency among critics is to treat the question simply as one of comparative credibility between the Synoptic Gospels and the Fourth, not as involving any inconsistency with what we know of the Apostle.

There seems to be in like manner a tacit agreement to treat the Apocalypse by itself independently of the Gospel. For supposing it to be proved that the two could not possibly have been written by the same author, it still would not follow that the author of the Apocalypse was St. John. And, however, this may be, Mr. Tayler has somewhat overlooked one important element in the conclusion, viz., the unparalleled psychological revolution that must have taken place in the mind of a Jew exiled to a centre of Greek culture and philosophy, and with the temple and the Jewish system along with it destroyed. We are inclined to think that other writers besides Mr. Tayler have underrated this consideration. Such a complete change of circumstances would tell upon style even more immediately and certainly than upon thought. It would be strange if an Englishman spoke German no better after 10 or 15 years' residence in Berlin, and it would be strange also if he did not more or less imbibe German ideas. The cases of Milton and Dryden adduced by Mr. Tayler are not really parallel, because neither of these writers lived out of England for any length of time.

Lastly, as to the external evidence, we are disposed to agree with M. Wittichen, that it "has in most cases had greater influence upon the final judgment of the critic, than the nature either of that evidence or of the ecclesiastical tradition on the origin of the books of the New Testament generally seems to warrant." The most that the external evidence can be said to prove is that the Gospel was current at a certain time, and not that it either was or was not written by St. John.

If these considerations are to be held valid, it would seem that more depends on an internal analysis than is consistent with the space which Mr. Tayler allots to it. We know that it has been for some time a characteristic of English criticism, to be jealous at least of some of the forms of internal evidence, but it is seen in practice that the subjective element which they imply is not incompatible either with scientific method or definite results.

Mr. Tayler concludes with a suggestion which curiously inverts the not uncommon view that the Gospel was written by the Apostle, and the Apocalypse by the presbyter. He apparently forgets for the moment that what is permitted to those who assign both to the Apostolic age is not permitted to one who places a gulf of nearly a century between them. John the presbyter, if he existed at all, was also one of the immediate "disciples of the Lord," and obviously could not have been the author of a work appearing between 135-163 A.D.

Looking back over Mr. Tayler's work as a whole, perhaps

we might say that it was valuable rather for the vivid and finished picture which it gives of the Christianity of the 2nd century, than for its direct bearing upon the Johannean question. It is written throughout with an elegance and chastened vigour which leave nothing to be desired.

W. Sanday.

Ecclesiastical History of England.—The Church of the Restoration. By John Stoughton, D.D. 2 vols. 8vo. Hodder & Stoughton, 1870.

This is a second instalment of the author's *Ecclesiastical History of England.* Vol. i. was occupied with the "Church of the Civil Wars," vol. ii. with the "Church of the Commonwealth." A fifth volume is promised in which the history is to be brought down to the Revolution. The 18th century is contemplated as among the visions of the future. The present volumes contain the history of Charles II. and James II., a period not so stirring as that which preceded it, yet quite as important to us. For while the Civil Wars passed over without leaving a trace behind in ecclesiastical institutions, it was under the Restoration that both Church and Non-conformity received the shape and assumed the attitude towards each other which they have maintained to our time.

The sources from which the present two volumes have been derived, are partly the standard authorities employed by all Church historians, partly MS. or unused materials.

The staple of the history is necessarily the same for all alike. The volumes in which it is to be found are, the *Parliamentary History of England*, Thurloe's *State Papers*, Kennett's *Register*, Burnet, Baxter, Neal, and Calamy. To these may be added Cardwell's *Synodalia*, Lathbury's *History of Convocation*, the continuation of Clarendon, and the Journals of the two Houses. Besides these the printed biographies, episcopalian and puritan alike, have been diligently used, and more than one interesting fact has been disinterred from a local history, *e.g.*, an anecdote is told (1, 127) of Lord Wharton from Lipscomb's *Hist. and Antiq. of Bucks.*

The MS. sources now employed for the first time are as follows:—The State Papers in the Record Office. Among curiosities entombed in this mass of records are the private letters written by various citizens of London describing the election of members to Chas. II.'s first Parliament, 1661. They were intercepted in the Post Office, and never reached their destination. (2) Some papers preserved in the Archives of Parliament, relating to the passing of the Act of Uniformity. (3) A register preserved in Dr. Williams' Library. (4) A Diary kept by Henry Townshend of Elmley Lovet, Worcestershire, in the possession of Sir Thos. Phillips. (5) The collections preserved in the University Library at Cambridge, the British Museum, Lambeth, Chichester, &c.

From such materials a narrative is compiled with industry, care and impartiality. Besides the regular narrative in chronological sequence of public events, chapters are added or introduced which serve to throw together stray characteristics of the men and the times. Such are vol. i. chap. 25, in which the Bishops of the Restoration are passed in review. The summary with which the review closes may serve to mark the author's point of view as a historian. He pronounces the best of the Bishops to have been men of ability, learning, of unimpeachable morals, hospitable, orthodox and devout. But he asks:—

> "Is there one among them to whom posterity can point as possessing, in an eminent degree, the true episcopal faculty, the gift of spiritual overseership, of a deep insight into Christ's truth, into God's providence, and into men's souls? Is there one who excelled in folding the sheep which were lost, one who struck the world's conscience, making it feel how awful goodness is?"

Two or three pages are all that is given to the rural clergy, the account of whom is founded on the same authorities as Macaulay's well-known picture, a picture which Dr. Stoughton pronounces a "humorous one-sided satire." We may here mention that a paper in the hands of the Record Commission has been examined by Dr. Stoughton, and found to confirm Macaulay's clever conjecture that the initials P. M. A. C. F. in the Somers Tracts (8, 428) denoted "Père Mansuete, a Cordelier Friar," who brought the sacrament to the dying Charles II.

Other chapters are devoted to illustrations of religious character in accounts of persons eminent for piety, church or puritan. The Lives of Oliver Heywood and of Philip Henry are windows through which we may discover the domestic habits of the nonconformists. The chapters on the Theology of the period are nothing more than abstracts of some of the principal books, or summaries of the opinions of the leading names. The fairness with which these summaries are drawn reminds us of Hallam; but they want Hallam's precision and literary appreciation.

This *Ecclesiastical History* will scarcely be more fortunate than the many meritorious attempts which have preceded it, which have been read in their day, and then dropped into oblivion. It has no life in it. With entire candour of disposition, there is wanting the comprehensive intelligence. Neither the events, nor the opinions, treated of, are brought within the scope of the great European progress. No law of development is discernible in his pages. History under such treatment is a succession of casualties, and science and philosophy are what people happen to be thinking.

Dr. Stoughton apologising for filling so many pages with mere analyses of books, says, "it would have been easier and more attractive to indulge in broad generalisations on the subject." It certainly is not easy to frame the one generalisation which is of any value in a history of opinions, theological or philosophical — viz. to detect the hidden thread of connection which binds together the opinions of any generation with those of the generation which preceded and the generation which followed it. How far from "easy" this task is, may be seen from the history of philosophy. Many hands have been labouring for many years in bringing into order the developments of philosophical opinion. Though much progress has been made, the history of philosophy cannot be said to have yet assumed a final shape. For theology much less has been done. For English theology, nothing.

Mark Pattison.

Intelligence.

Tregelles' Greek Testament.—We deeply regret to learn that, owing to the severe illness of the editor, the publication of the sixth part of this great work, containing the Apocalypse, is postponed. The revision of the concluding chapters and the appendix are all that remains to be done.

The Site of Paradise.—Among the papers read at the British Association was one by Sir Henry Rawlinson on the site of the Terrestrial Paradise. He supposes the geographical description in Gen. ii. to be derived not from Iranian mythology, but from Babylonian tradition. "Gan-eden," or the Garden of Eden, is in his opinion a Hebrew modification of one of the old vernacular names of Babylonia—"Gan-duni;" "Gan" signifying apparently an enclosure, while "Duni" was the name of a deity. The four rivers are the Tigris and the Euphrates, the Surrapi and the Ukni, *i. e.*, the eastern arm of the Tigris and the western of the Euphrates. Cush (rendered in the Authorised Version, Ethiopia) is one of the primitive capitals of Babylonia. It is needless to add that, as at present stated, this theory is much less plausible than that which connects the narrative in Genesis with Iranian myths, especially as the serpent, and the Tree of Life with its guardian the cherubim, are still unexplained from Babylonian sources.

Contents of the Journals.

Theologisch Tijdschrift. September: James and Peter, by A. H. Blom. [Shows that Peter's conception of the Law differed from that of James in being more ethical.]—Contributions to the history of Israelitish religion, by A. Kuenen. [An answer to three questions connected

with the sacerdotal portions of the Pentateuch and Joshua. 1. They are not by one author only. 2. Those which occur in Genesis are taken from a record complete in itself, though based largely on the Jehovist. 3. After the redaction of the Pentateuch by Ezra (about 450 B.C.), the text received much alteration and expansion for a century and a half or two centuries. But from 250 B.C. onwards the Masora and the LXX., which are often confirmed by the Samaritan recension, prove its substantial integrity.] — Dreydorff's Life of Pascal, by Rauwenhoff. Pre-historic Times, as illustrated by Ancient Remains, and the Manners and Customs of Modern Savages. By Sir John Lubbock, Bart., F.R.S., &c. Second Edition. Williams and Norgate, 1869.

The Origin of Civilization and the Primitive Condition of Man. Mental and Social Condition of Savages. By Sir John Lubbock, Bart., F.R.S., &c. Longmans, 1870.

Researches into the Early History of Mankind and the Development of Civilization. By Edward B. Tylor, author of *Mexico and the Mexicans*. Second Edition. London: Murray, 1870.

[FIRST NOTICE.]

WITHIN the present year Sir John Lubbock has given us a first, and Mr. Tylor a second, edition of a work on the early history of mankind. Sir John Lubbock's new work, *On the Origin of Civilization*, is an expansion of two chapters in the second edition of his older work on *Prehistoric Times;* still it is more or less the result of new thought, it aims at a new object, and where it employs old materials, it has put them into new combinations, and so may be looked upon as substantially a new book. The two works of Sir John Lubbock and Mr. Tylor respectively, appear to us to agree as to the main issues of which they treat, both authors being alike opponents of the doctrines which Mr. Tylor has (p. 374) styled "degenerationist;" the material points of fact and of inference as to which they differ are of but infinitesimal moment, and a large proportion of the arguments employed by the one will, on due search, be recognised as employed by the other. Still in style, in tone, and in the arrangement of their materials, the two works differ widely. Mr. Tylor has written a little more like a historian, Sir John Lubbock a little more like a naturalist; but as if to supplement these merely relative inferiorities, we have in Mr. Tylor's book those *deverticula amœna* which relieve the attention, whilst the necessity to which scientific meetings have so often reduced Sir John Lubbock of defending his theses *vivâ voce*, and at a moment's notice, have given his writing that dialectical precision which is so rarely found combined with a mastery of complex problems of natural history.

Both these writers are agreed as to the interpretation which ought to be put on the one hand upon the past, and on the other upon the future, of our species; both alike regard civilization as the result of a long series of slowly accumulating improvements, and savagery as the condition in which the whole species was once involved, and of which we can still form an estimate from looking into the condition in which some less-favoured races still remain; and to both alike this reading of the history of the past appears to afford reasonable grounds for hopeful confidence as to the future. But they not only see in the languages, arts, customs, laws and rites of modern savages, evidence as to what those of our own forefathers were; they exchange, from time to time, the process of synthesis and the consideration of possible developments for the process of analysis, and busy themselves somewhat amusingly in pointing out how, even in our complex civilization, traces of a humble origin, and of affiliation to the social and domestic economy of barbarism may be detected, and this even in things no less sacred and serious than marriage.

A curious correspondence, and one which Sir John Lubbock certainly and Mr. Tylor probably will be slow to repudiate, may be pointed out in detail between their speculations and the lines of argument which Mr. Darwin has used in his *Origin of Species*. Mr. Darwin's arguments from the gradations towards perfection observable in structural arrangements, may be paralleled by their arguments drawn from the observation of variations ranging between the lower and the higher forms of customs and practices; the famous argument from the history of development is paralleled by their elaborate demonstration of the correspondence between the phases of mental progress noticeable in our own nurseries and the operations of the intellect of the savage; the argument, lastly, which is based upon the existence of rudimentary structures, finds its counterpart in the detection of the persistence still amongst us of customs which are traceable back to the early days of our race, and which, as "standing over" into new eras, have been etymologically termed "superstitions." The multitude of the facts which these authors have amassed is enormous; but so far as they bear upon the conclusion that "the history of the lower races, as of the higher, is not the history of a course of degeneration or even of equal oscillations to and fro, but of a movement, which in spite of frequent stops and relapses, has on the whole been forward" (Tylor *l.c.* p. 191, 193, and 374), they admit of being marshalled under one or other of these heads, and of having or seeming to have their fitting place rather in a history of progress than in one of degeneration. Amongst the collateral issues which Mr. Tylor raises and deals with, are the question of the geographical points wherein certain widely-diffused myths, and the races believing in and retaining them, took origin and spread (see pp. 206, 331, 338, 369), and in two of his chapters, those namely on the "Stone Age," and on "Fire Cooking and Vessels," he makes incursions into territory more largely treated of in Sir John's other, older, and larger, work.

A very large portion of Sir John Lubbock's book is devoted to a review of the various phases under which the religions of barbarians have shewn themselves, whilst a considerable portion of Mr. Tylor's is taken up by disquisitions on the genesis of language and of writing. But perhaps the most characteristic portion of Mr. Tylor's work, as compared with and in connexion with the object of Sir John Lubbock's, is his chapter on "Images and Names." Both writers are at one as to the principle that the history of a child's mental growth may, as savages are merely grown-up children, be taken as a type and sketch of what the history of the mental growth of the race has been; but it is Mr. Tylor who has most fully worked out the particular point that savages and children both alike agree in falling into that confusion of object and reality with image and representation upon which the practice of magic, so deeply interwoven into the texture of many religions, ultimately rests; and it is Mr. Tylor who most emphatically insists upon the demonstration of this connexion as an argument for the theory of which both he himself and Sir John Lubbock are advocates against the Degenerationists (see Tylor, p. 373-374 ed. 2nd, p. 365 ed. 1st). Happily neither the malevolent nor the erotic passions are commonly so strongly developed in children of the doll-loving age as to impel them to use their waxen images for the same purposes as the Canidia of Horace's Epode (xvii. 82) used her bitumen, or the Simœtha of Theocritus (id. ii. 28) her wax; still images of the former kind do possess for the minds of children even in these days, we are assured, a double personality. We can refer, as we hope, most of our readers to sources whence they can satisfy themselves as to this point at first hand; what we wish to do is to draw attention to the fact that in many savage minds lodged in modern adult bodies the same confusion as to the identity and non-identity or at least the essential interdependence or independence of image or picture and of person represented still persists.

It was but a few weeks ago that we read of a crowd of adult men and women looking on with admiration whilst a *gens-d'armes* stabbed the picture of a fallen potentate in its various "vital parts," as the description ran, with his bayonet; Mr. Quilp, it will be recollected, entertained himself with similarly piercing the wooden figure-head which stood for the man whom he was to see ruined by the perjury of Mr. Brass and the unwilling truth-telling of Mr. Richard Swiveller; and as Persius lived, as we have lived, in the time of a decaying Imperialism, we may take the *Veneri donatæ a virgine pupæ* of his Satire ii. 70, as a third modern instance without caring to enquire whether the practice here referred to can find parallel nearer our own time and country (see Tylor, p. 124). These remarks lead us on to say that though both our authors recognize, and indeed dwell upon the facts of the retention still amongst us of customs which can only be explained as being rudiments and reminiscences of the rites and practices of savagery; neither of them has, as we think, drawn sufficient attention to the fact, essential though it is to this argument, that these rudimentary indications are by no means to be sought or found in one stratum or level of society alone; but are, proportionately at least, as numerous in the higher as in the lower walks of life. If it was amongst the lower classes only that we met with the "Survival" of Superstitions, this survival would tell in favour of rather than against the degenerationist hypothesis; but as a matter of fact, we are inclined to think that practices and modes of thought of the kind in question are, due regard being had to the relative number of the several classes, little less common with the educated than among the uncultivated portions of society.

Without pledging ourselves to the entire validity of Sir J. Lubbock's and Mr. Tylor's argument, even when supplemented as we suggest, we think that they might have claimed for the peculiar practices and views of which we are speaking a greater generality and a wider diffusion than they have claimed for them, and that thus they would have been better able to speak of them as depending not merely upon external and accidental conditions, but upon causes essentially interwoven into the very texture of our being. When and wheresoever education, with the thoughtfulness and self-control which it implies, is deficient, impulses, whether superstitious or passionate, will make themselves seen and felt in action so soon as means for their gratification are present and the counter-check of public opinion is removed. And we can hence understand that it is likely, as we may convince ourselves by examination that it is actually the case, that in those numerically small spheres of society which are largely endowed with this world's goods, modes of thought, and even actual practices, which can be legitimately affiliated to those of savagery, may be proportionately as rife as they are in the secluded and pauperized villages of agricultural and mountainous districts. A proneness to exaggerate politeness into punctilio; a tendency to over-legislation and especially in trifles; an incapacity for sustaining attention continuously, especially when abstract terms are employed, and sometimes even when the matter for consideration is a choice between but two alternatives; an abstinence from all mention of the names or reference to the destiny of the dead, alternating with certain views as to the dependency of that destiny upon the social position held in this world; the employment of certain euphemisms for certain objects, with the view of pushing them out of consideration; are each and all of them points instanced in various pages* of the two works before us as points characteristic either of savages or of children or of both; but it would be easy to show by purely literary evidence, such as that which Swift's conversations, and the mock effusions of other authors, ascribed to "Persons of Quality," that these peculiarities are by no means confined either to savages and children or to the lower strata of society alone.

George Rolleston.

(*To be continued.*)

Lay Sermons, Addresses, and Reviews. By T. H. Huxley, LL.D., F.R.S. London: Macmillan and Co. 1870.

On the Scientific Use of the Imagination. A Discourse delivered before the British Association at Liverpool, by John Tyndall, LL.D., F.R.S. London: Longmans. 1870.

Professor Huxley has chosen, perhaps intentionally, certainly opportunely, the year of his Presidency of the British Association for the publication of a volume of essays which appeal rather to the world of culture and letters than to that of pure science. Pre-eminent in his own special pursuits, Dr. Huxley is careful to avoid the exclusiveness which is the bane of the specialist, and is never satisfied without determining for himself, and exhibiting clearly and forcibly to his readers, the bearing of his own studies on the main currents of thought which characterize the present age. It is true that some of the essays in the present volume—the addresses, for example, to the Geological Society—appeal to a merely scientific audience; but it is obvious that the spirit of the work is to be found in its main title *Lay Sermons*, and that its writer wishes to speak not specially as a man of science, but as the advocate of a new culture, and the apostle of a new gospel.

---

* Lubbock, pp. 303, 304, 355; Tylor, pp. 144, 145; Lubbock, pp. 267, 349.

In each of these characters Professor Huxley has much to say that is well worth saying, and it is almost needless to add that it is thoroughly well said. He sees clearly, and argues strongly, that the existing educational institutions have fallen behind their age, and fail to do for modern culture what they did in former times. Fed with the strong meat of modern science, he loathes the sickly training which goes by the name of education in our universities and public schools; but he forgets, it would seem, that this education is only bad because there exists no effective demand for its improvement, not because the scientific study of classical or other antiquity has ceased to be a potent instrument of culture. Classical education, as it now exists in this country, is the feeble offspring of a noble and generous system, and it is scarcely fair to compare it with a system which does not yet exist, and has therefore all the advantages of imposing theory, and none of the drawbacks of degenerate practice. The question is not, as Dr. Huxley virtually puts it, Can scientific education be made a better instrument of culture than classical education actually is? but rather, Is natural knowledge, as it is commonly called, a better instrument of culture than the knowledge of classical antiquity? He well points out, in a passage which we regret we cannot quote at length, that "Science is nothing but *trained and organized common sense*" (p. 86); and if this be so, as we firmly believe, what is the difference between the common sense which investigates the facts of antiquity, and that which investigates the facts of nature? We regret that a writer with whose main purpose of making education real and adequate we entirely sympathize, and who shows in more than one passage that he has a true appreciation of the value of classical culture, should have addressed to working-men such words as the following:—

"I weigh my words well when I assert, that the man who should know the true history of the bit of chalk which every carpenter carries about in his breeches-pocket, though ignorant of all other history, is likely, if he will think his knowledge out to its ultimate results, to have a truer, and therefore a better, conception of this wonderful universe, and of man's relation to it, than the most learned student who is deeply read in the records of humanity and ignorant of those of nature" (p. 195).

Are the records of humanity, then, not a part of those of nature? May we not rather say that if we take the smallest particle of knowledge of any kind, whether of man or of nature, if the two are to be regarded as distinct, and think it out to its ultimate results, we shall be incomparably better educated than if we never think at all? Surely the purpose of all education is to make a man think, and use his faculties, to fit him for that game of chess by which our author so strikingly symbolizes man's relation to the universe. Dr. Huxley thinks that the time has now come when we should recognize that the best training for this purpose is to be found in natural knowledge, and assuredly some natural knowledge is essential to each man's welfare. Nevertheless there are many who are not prepared to relinquish the belief that all true knowledge is natural knowledge, and that while all is good, some particular kinds, and notably that of the antiquity wherein lie buried most of the roots of our modern life, are especially suited to be made the instruments of a wide and humane culture. It is well to know all that can be known about a piece of chalk; it is well too, perhaps better, to know all that can be known about Homer and Aristotle.

It would scarcely be fair to say that not content with invading culture, science is now preparing to assail religion; but the writer of the words we are about to quote would be the last to deny that he is at open variance with much that commonly goes by the name of religion:—

"If the religion of the present differs from that of the past, it is because the theology of the present has become more scientific than that of the past; because it has not only renounced idols of wood and idols of stone, but begins to see the necessity of breaking in pieces the idols built up of books and traditions and fine-spun ecclesiastical cobwebs: and of cherishing the noblest and most human of man's emotions, by worship 'for the most part of the silent sort' at the altar of the Unknown and Unknowable" (p. 20).

The opposition between science and religion is deep-seated and is the expression of the inevitable antagonism between the progressive and conservative forces of humanity; still their goal is one, and no man of fairness and candour, be he the champion of religion or of science, will cherish beliefs that can be proved to be false. Nor is the criterion of truth in religion different from that in science, it is only vastly more difficult of application, and if the man of religion refuses to yield save to the clearest and most irrefragable evidence, he is only exercising that wary scepticism which is the safeguard of science, and practically illustrating the fundamental maxim of Descartes which is so eloquently enforced by Dr. Huxley himself. With positive knowledge the true religious spirit can only be temporarily at variance; it moves slowly and with cautious steps as becomes the guardian of such momentous interests, but it meets science fearlessly on the common ground of reasoned truth. With this spirit Dr. Huxley is in no sense at variance, and few passages in the volume are more striking than those wherein he dwells on the spiritual aspects of scientific culture. It is the more to be regretted that there are other passages of a controversial nature where his usual urbanity seems to forsake him, and where he attacks his adversaries almost with ferocity; the following words, which will be familiar to many, illustrate our meaning:—

"Extinguished theologians lie about the cradle of every science as the strangled snakes beside that of Hercules; and history records that whenever science and orthodoxy have been fairly opposed, the latter has been forced to retire from the lists, bleeding and crushed, if not annihilated; scotched, if not slain. But orthodoxy is the Bourbon of the world of thought: it learns not, neither can it forget" (p. 305).

If the victory has, as is doubtless the case, been uniformly on the side of science, surely science can afford to be a generous foe; there is certainly something undignified in the tetchiness which science exhibits at the unavailing assaults of its oft-defeated antagonist. Time itself is on the side of science, and with truth as its weapon it can safely afford to wait. It is sad to see men of science of the foremost rank, like Dr. Huxley, wasting their time and energies in controversy, as unavailing as it is undignified, with mere bigotry and intolerance. That Dr. Huxley knows how to treat a religious antagonist generously and with dignity the following extract will show:—

It was my fortune some time ago to pay a visit to one of the most important of the institutions in which the clergy of the Roman Catholic Church in these islands are trained; and it seemed to me that the difference between these men and the comfortable champions of Anglicanism and Dissent was comparable to the difference between our gallant Volunteers and the trained veterans of Napoleon's Old Guard.

"The Catholic priest is trained to know his business, and do it effectually. The professors of the college in question, learned, zealous, and determined men, permitted me to speak frankly with them. We talked like outposts of opposed armies during a truce—as friendly enemies" (p. 68).

Perhaps the first paragraph in this extract serves to explain the different treatment which Anglican orthodoxy and Ultramontanism meet with in this volume; the English clergy, for the most part, are not unlike Mr. Matthew Arnold's young man from the country, "serenely unconscious that they are not at the centre of the situation." Ultramontanism places itself at the centre of modern thought in order that it may oppose it; Anglicanism is equally zealous in opposition, but is far removed from the centre. We would suggest, however, to Dr. Huxley, with all deference, that unless his opponents are prepared to meet him on the common ground

of truth and positive knowledge, they are unworthy of his steel, and that where fighting is out of the question, mere railing is undignified.

We have dwelt on what we conceive to be two of the chief points of interest in this book, namely, the bearing of the modern scientific spirit on general culture and on spiritual beliefs; there is a third point, of scarcely less interest and importance, on which space will not permit us to dwell at present, the relation of modern science to speculation. The tendency of scientific enquiry in the present day seems to be towards a new synthesis of materialism and idealism, the conception of which will be familiar to students of the works of Mr. Herbert Spencer. This tendency is well illustrated by two discourses on "The Physical Basis of Life," and on "Descartes," and finally summed up thus :—

"The reconciliation of physics and metaphysics lies in the acknowledgment of faults upon both sides; in the confession by physics that all the phenomena of nature are, in their ultimate analysis, known to us only as facts of consciousness; in the admission by metaphysics, that the facts of consciousness are, practically, interpretable only by the methods and the formulæ of physics" (p. 374).

This fruitful conception that "legitimate Materialism . . . is neither more nor less than a sort of shorthand Idealism" is destined, as it seems to us, to form the basis of a new school of speculative thought; if so, that school will be fortunate in reckoning Dr. Huxley among its leaders, for we know not where else it would find combined, profound scientific knowledge, especially in those biological sciences which glide almost imperceptibly into psychology, keen speculative ability sharpened by adequate training, and a rare power of accurate and subtle thought matched with a still rarer power of precise and graceful speech.

The discourse "On the Scientific Use of the Imagination," delivered last month, at Liverpool, by Dr. Tyndall comes opportunely to illustrate some of the points on which we have already dwelt. There is the same feverish sensitiveness to the antagonism of orthodoxy, and the same sense of the intimate relation between the results of scientific research and speculative thought. As Dr. Huxley had explained to a general audience the analysis which leads to the physical basis of life, so Dr. Tyndall explains to an audience not wholly scientific the analysis which leads to the basis, which cannot but be called physical, of inorganic matter. It is in this analysis which though within the legitimate range of science lies on its extreme verge, that, according to Dr. Tyndall, the imagination is specially called into play. No eye has seen nor microscope revealed the ultimate atoms or molecules of which matter is now regarded as composed; they make their presence felt by unmistakeable sensible phenomena, but they appear themselves to the imagination alone; the conception we are forced to frame of these atoms, symbolic as it may be, is legitimate, for it rests on strong and extensive analogies, and serves to explain as no other hypothesis does the phenomena with which it deals; it is also imaginative for it may not be absolutely true, but imagination here as in other cases lends its aid to science in framing a hypothesis which serves as a basis for further research. This view, which is not perhaps particularly new, is expounded with much wealth as well as freshness of illustration by Dr. Tyndall.

If Dr. Tyndall is not quite Dr. Huxley's equal in the art of expounding in a popular manner the latest results of delicate and abstract scientific research, he is at least a very near competitor: though somewhat diffuse, and perhaps a trifle self-conscious, he has the power which is given to few of carrying his hearers by simple and easy steps into regions which, as he says, "have been hitherto crossed by the pioneers of science alone." James R. Thursfield.

Scientific Notes.

Natural History.

Beetles in Wasps' Nests.—In the last number of the *Annals and Magazine of Natural History*, Dr. T. A. Chapman has settled a point which has been warmly debated in that journal, respecting the relation of the small species of beetle, *Rhipiphorus paradoxus*, generally found in wasps' nests, to the wasp. From analogy, the parasitic nature of *Rhipiphorus* might be concluded, as that insect is very nearly allied to *Meloë* and *Sitaris*, both of which are parasitic in their larval state. Dr. Chapman's observations prove incontestably that the near zoological relationship of these insects is strongly reflected in their mode of life. He has found in a wasps' nest a minute six-legged active larva, closely resembling that of *Meloë* in its structure, and evidently going about in search of a suitable victim on which to feed. He has not seen the attack made by this little creature, but it is clear that the young parasite selects a nearly full-grown larva of the wasp, eats its way through the skin of the body, and lives for a time as an internal parasite. In the situation here described the author discovered a soft fleshy larva, closely resembling those found at a later period feeding from the outside, upon the wasp-grub, *but still retaining the horny head, the six little legs, and the horny plates of the body segments of the minute active larva* first mentioned. At this stage of its growth the young parasite emerges from the wasp-grub by piercing the skin at the front of the fourth segment, and in emerging it appears to leave its skin behind it in the aperture through which it makes its escape. It then acquires the aspect of a mere soft white grub, not unlike that of the wasp, to which it now adheres by its jaws immediately behind the head. The cast skin, which retains the horny dermal plates of the first larval form, probably assists in stopping the effusion of the fluids of the wasp-grub through the wound. The further transformations of the *Rhipiphorus* are described in detail by Dr. Chapman, but the point of most general interest in his paper is the detection of the agreement in their mode of development between this insect and the nearly-allied *Meloë*. The chief point now to be ascertained is the place and time of the deposition of the eggs of the *Rhipiphorus*, and the mode in which the larvæ are introduced into the wasps' nests. The young six-legged larvæ of *Meloë*, as is well-known, frequent flowers from which they are carried by bees into their nests, and the *Rhipiphorus* probably adopts a similar mode of transport.

Parthenogenesis in the Pupa state of Insects.—In vol. xv. No. 8, of the *Memoirs of the Academy of St. Petersburg*, M. O. von Grimm describes a curious instance of Parthenogenesis in a species of the dipterous genus *Chironomus*. Like the well-known case of *Miastor*, discovered by Prof. Wagner, this is an example of reproduction by an insect in one of its preparatory, and therefore sexless stages, called *Pædogenesis* by Von Baer. The formation of the egg-like reproductive bodies commences in the larvæ; but the eggs are not extruded until the insect has passed into the pupa state. It appears that in the spring the larvæ, produced in the ordinary way from eggs, grow rapidly, and after the third change of skin attain their full size, and show distinct traces of the pupa within them. The eggs are produced direct from the pupa in this condition. In the autumn the course of development during the preparatory changes is precisely the same; the pupa, however, changes into the imago, which deposits the eggs, probably after copulation, in the ordinary manner. The mode of development of the eggs and ovaries, and that of the embryo in the egg, are described by the author at considerable length, and illustrated by good figures. The eggs are developed in the same way, both in the spring and in the autumn, although in the one case they will be deposited by the pupa, and in the other by the imago; and as they present no difference in their structure, the author regards them all as eggs, and rejects the distinction into *ova* and *pseudova*. He seems inclined to adopt the notion that the supposed cases of parthenogenesis may be due to self-fecundation.

Physiology.

Dr. Meynert on the Histology of the Brain.—The fourth part of Prof. Stricker's *Handbook of Histology* has passed out of the editor's hands, and will appear immediately. This work will have an especial interest, since it will contain the results of Dr. Meynert's investigations into the histology of the brain. Dr. Meynert, who is chief physician to the great lunatic asylum of Vienna, has been engaged on this difficult subject during the greater part of his life, and his conclusions have not yet, to any great extent, been brought before physiologists. The chromic acid method has been principally made use of, the sections being stained with carmine, and rendered transparent by means of oil of cloves. The investigations have not been confined to the human subject, but have extended to apes and other animals. The following papers have also recently appeared upon this subject, in addition to the well-known researches by Lockart Clarke.—*Bemerkungen über die Ganglienkörper der Grosshirnrinde des Menschen*, von Dr. Rudolph

Arndt, Max Schultze's Archiv, 1870. *Untersuchungen über die Kleinhirnrinde des Menschen*, von Dr. H. Hadtrop.

Epileptic Guinea-Pigs.—In investigating the subject of the hereditary transmission of nervous and other lesions, of which he gave an account at the recent meeting of the British Association, Dr. Brown-Sequard has lately been making a series of experiments upon guinea-pigs, which he has rendered epileptic by artificial means. A guinea-pig is made epileptic either by the section of one-half of the spinal cord or by the division of the sciatic nerve on one or both sides. The fits begin to develop themselves in about nine days after the operation, commencing by a convulsive movement of the hind-leg on the side of the body on which the operation has been performed. The head then twists round towards the same side, the jaws working convulsively. After a short interval the head turns completely round to the other side. At this moment sensation is lost and the fit becomes complete. The fits develop gradually, the successive stages presenting themselves one by one in the same order as they occur in each fit in an animal whose epileptic state is complete. Thus a guinea-pig acquires first a convulsive motion of the hind-leg, then this combined with the first motion of the head, then the perfect fit. The fits may be brought on at will by rubbing between the finger and thumb a portion of skin lying within a certain zone. If the nerves supplying this zone be laid bare, irritation of them will not produce the fit, though irritation of the skin will still do so. The zone includes the face, cheeks, and top of the head, and extends a short distance down the back, but misses the nose and ears. Its limit differs slightly in different specimens, but is always sharply defined by the immense quantity of parasites with which it is infested. This is due to the fact that as the fits develop themselves, common sensibility is lost within the zone. Guinea-pigs in which epilepsy has been produced by section of the spinal cord remain epileptic, but can be cured at will by section of the skin within the zone. Those in which the disease has resulted from division of the sciatic nerve cure themselves in the space of a year or a year and a half. It is a remarkable fact that as the cure takes place the hair on the zone becomes atrophied. During the fits it sometimes happens that the hind-foot gets between the teeth and is bitten. The animal on recovery from the fit tastes the blood, and, if it be one in which the sciatic nerve has been divided, proceeds to nibble off the two outer toes which have entirely lost their sensibility from the operation on the nerve. Dr. Brown-Sequard had several cases in which this happened. In breeding from pairs of this kind, he was astonished to find that the offspring is without the two toes of which the parents have deprived themselves. Moreover in these cases all the offspring have as they grew up become perfectly epileptic. In ordinary cases epilepsy is only rarely transmitted hereditarily. On dissection of one of the hereditarily malformed animals, a node was found on the sciatic nerve corresponding to that formed after section of the nerve in the parent. Epileptic guinea-pigs are also liable to a peculiar dry gangrene of the margin of the ears. The tissue on this spot becomes desiccated and dowdery, and eventually falls away leaving the margin slightly indented. A corresponding fact is the affection of the ears, called Othæmatoma, observed in lunatics, and formerly supposed to be due to ill-treatment by attendants. The fold of the concha of the ear in epileptic guinea-pigs becomes also less pronounced. Both these peculiarities have been found to be transmitted hereditarily in a large number of instances.

Researches on Digestion.—Dr. Paschutni of St. Petersburg, has recently been making a series of investigations on the digestive process, in the physiological laboratory of Prof. Setschenow, with the following results:—First, aqueous infusions of the mucous membrane of the small or large intestine of the dog, when maintained at a temperature of about 100° Fahr. in order that self-digestion may take place, give, in the course of three or four hours, voluminous precipitates of albumen, that remain unchanged till putrefaction sets in; coincidently the alkaline reaction changes to acid, and the fluid is no longer able to reduce the oxide of copper. The infusion of the mucous membrane appears to have no power of converting the fibrin of blood or other albuminous compounds into peptone, and the fats are not decomposed, and only slightly emulsified by it. He found that the juice or secretion of the small intestine, obtained by Thiry's method from a loop of the intestine, possessed no power of digesting fats and various albuminous compounds, and only a slight action on fibrin. The infusion of the mucous membrane of the small intestine can convert starch into sugar, but this power is also possessed by the mucous membrane of the trachea and urinary bladder in an almost equal degree, to a smaller extent by that of the gall-bladder, the cæcum, and large intestine, and to a still smaller degree by that of the stomach and rectum. Secondly, the infusion and secretion of the mucous membrane of the small intestine can alone convert cane into grape-sugar; but this is only the case in certain animals, as in the dog, pig, rat, mouse, and rabbit, whilst it does not occur in the Ruminantia. Thirdly, those infusions that can convert starch into sugar and cane-sugar into grape, contain two distinct ferments, which can be separated from one another by appropriate means, and especially by filtration through an animal membrane. The infusion that effects the conversion of starch into sugar appears to be obtained chiefly from the muscular layers of the intestine. Fourthly, a temperature of over 104° Fahr. operates destructively upon the animal ferments, the effect varying in activity with the duration of its application and the concentration of the ferment. In regard to the saliva it was found that the temperature at which the operation of its peculiar ferment, when diluted with 10 or 12 parts of water, upon boiled starch, is most intense, is from 100° to 106° Fahr. It is more difficult to determine the temperature of greatest activity for uncooked starch; it is certainly higher, but varies in different instances. When the ferment is weak it is probably about 144° Fahr., when the ferment is concentrated it is probably over 149° Fahr. Dr. Paschutni shews that the admission of air at ordinary temperatures to starch-paste causes the formation, in a period varying from a few hours to two or three days, of a material that is capable of reducing oxide of copper. The paste that has undergone this change can act as a ferment on fresh paste, but boiling it destroys its capability of doing so.

Tactile Hairs of Mammalia.—Odenins, who recently investigated this point of histology, has stated that the nerves of the tactile hairs ended, after becoming non-medullated, with terminal enlargements in the homogeneous layer of the papilla. In the annular swelling around their bases he was unable to find any nerves, and considered that it fulfilled only a mechanical function. In a paper in the *Centralblatt für die medicinischen Wissenschaften*, Dr. R. Burkart states that the annular swelling consists, in the hairs of the muzzle of the mouse, guinea-pig, rabbit, and cat, of finely-fibrillated connective tissue, containing cells in its fine meshes. By the aid of a method which he intends shortly to publish, he has been able to stain nervous tissue of a bluish or coal-black tint, without modifying the connective tissue, gland substances, &c. The agent employed is perosmic acid. And he has ascertained not only that the annular swelling is supplied with nerves, but that the source from which it receives its nerves is the innermost part of the compact layer of the papilla.

On the Connective Tissue of the Brain.—Signor Golgi (in *Rendiconti del R. Instituto Lombardo di Scienze e Lettere*, ser. ii. vol. iii. fas. vii. p. 3) has been making some interesting investigations on the structure of the brain after maceration for 24 or 48 hours in osmic acid. Thin sections thus treated exhibit numerous stellate cells, the protoplasm of which gives off a variety of branches, some of which anastomose with those of other cells, whilst others are lost in the grey and finely-granular neuroglia; and others again, and these are the most numerous, pass to the walls of the capillary blood-vessels and larger lymphatics. He makes the observation that in such sections the brain-substance is seen to be in immediate contact with the vascular walls, no intervening space being visible, as in preparations that have been treated with bichromate of potash. This has an important bearing on the histology of the brain, since Eberth, His, and others have regarded these spaces as the lymphatics of the brain. The anastomosing connective tissue cells above described are most abundant near the surface of the brain, and they gradually diminish in the deeper parts, so that in the region of the ganglion-cells, and still more of the white substance, they are very sparingly present.

Development of the Heart.—Professor Rokitansky of Vienna, will shortly publish a work on abnormalities in the heart and great vessels, a subject on which he has long been engaged. From pathological research he has come to the conclusion that the received history of the development of the heart is incorrect in several particulars, and these conclusions have been confirmed from the physiological point of view by Professor Stricker, who will also contribute to the volume. Rokitansky possesses probably the largest collection of specimens of abnormal hearts in existence.

The Organ of Taste in the Tadpole.—F. E. Schultze, in a late number of the *Archiv für Mikroskopische Anatomie* (Band vi.), gives a description of the organs of taste possessed by the fully-developed larva of the *Pelobates fuscus*. The oral cavity of this animal exhibits on minute examination about 200 papillæ, and of these about 80 are distinguished from the rest by their larger size and more conical form. These last receive a supply of nerve fibres, which Stricker believed to terminate beneath the epithelial layer in slightly bulbous enlargements. Schultze however contends that they may be traced to the epithelial layer itself, where they form cup- or chalice-shaped organs that resemble in all essential particulars the gustatory cells described by Schwalbe and Lovén in the tongues of mammals.

Botany and Geology.

Do Plants absorb Moisture through their Leaves?—Two French botanists, Prillieux and Duchartre have recently turned their attention to this question, and their experiments lead to the conclusion that it must be answered, contrary to the belief of all the older botanists, in the negative. M. Duchartre's experiments were made for the most part on epiphytes, plants having no direct communication with the soil, and which are yet found to contain potash, soda, alumina, and other ingredients which plants whose roots grow in the earth derive from that source. If these plants derive their sustenance from the moist vapour by which they are surrounded, it is difficult to understand how they can

procure these materials. But if they absorb not aqueous vapour, but water itself, we can at once account for the possession of these inorganic materials. To ascertain how far this conclusion is just, M. Duchartre placed several of these epiphytes, provided with their aërial roots, in closed vessels filled with moist vapour; the result was to confirm the observation of Prillieux, that under these circumstances the plants lost weight. If, however, from any cause the plants came into contact with liquid water, it was absorbed readily, and the plants increased in weight. When leaves, flaccid from undue evaporation, are suspended in moist air, they recover their freshness, though they do not gain in weight; hence the inference is drawn that the renewed vitality of the leaves is due, not to the absorption of vapour, but to the transference of fluid from one portion of the branch to another. When leaves, however, are actually plunged in liquid water for a considerable time, they do absorb it in considerable quantities. A good account of these experiments will be found in the *Gardeners' Chronicle* for Sept. 17th.

Self-Fertilisation and Cross-Fertilisation of Plants.—Mr. A. W. Bennett reports in the *Journal of Botany* for October a series of observations on this subject. He states that there are now known to be three modes by which cross-fertilisation is especially favoured:—the phenomena of dimorphism and trimorphism, to which Darwin has called attention; special contrivances for effecting the transference of pollen by insects from one flower to another; and the fact, which has not yet received so much attention, that in the same flower the pistil and stamens frequently arrive at maturity at different times. By observing a number of British plants, he has come to the conclusion that the most usual order is for the stamens to ripen before the pistil (protandry); the simultaneous maturing of the two organs (synacme) is nearly equally common: while the ripening of the pistil before the stamens (protogyny) is far more rare. Although protandry and protogyny do not, in most cases, actually forbid the possibility of self-fertilisation, they render cross-fertilisation far more likely. The most striking contrast was found to exist between the common harebell (*Campanula rotundifolia*), in which the pollen is discharged and the anthers wither up long before the stigmata are developed; and the *Scrophularia aquatica*, in which the pistil is mature very much earlier than the stamens.

Colossal Fossil Sea-weed.—From the microscopic examination of the structure of specimens of the fossil trunks described under the name of *Prototaxites Logani*, and which Principal Dawson affirmed in his Bakerian lecture before the Royal Society, to be the oldest known instance of Coniferous wood, Mr. Carruthers has discovered that they are really the stems of huge *Algæ*, belonging to at least more than one genus. They are very gigantic when contrasted with the ordinary Algæ of our existing seas, nevertheless some approach to them in size is made in the huge and tree-like *Lessonias* which Dr. Hooker found in the Antarctic seas, and which have stems about 20 feet high, and with a diameter so great that they have been collected by mariners in these regions for fuel under the belief that they were drift-wood. They are as thick as a man's thigh.

Chemistry.

Oxygen, Ozone, and Antozone.—In a paper recently published in *Liebig's Annalen*, cliv. 215, Nasse and Engler have endeavoured to shew that antozone is peroxide of hydrogen diffused in oxygen. Schönbein's theory, which, however, has not gained general acceptance, is, that ordinary oxygen may be decomposed by electricity into ozone and antozone, and conversely, that the two latter substances may be united so as to make oxygen. Ozone is maintained by the best authorities to be an allotropic modification of oxygen; indeed it has been proved to be such, many years ago, by the excellent researches of Marignac, *Ann. de Ch. et de Phys.* xiv. 252. But antozone was held by Von Babo and Weltzien to be nothing but a small quantity of peroxide of hydrogen diffused through a large volume of air or oxygen. The following experiments of Nasse and Engler confirm this last conclusion. A mixture of oxygen, ozone, and the supposed antozone, was passed through a solution of potassic iodide in order to absorb the ozone. The residual gas, consisting of oxygen and antozone, was then conducted through glass tubes, which were kept by a freezing-mixture at temperatures of about $-20°$ C. By this treatment only pure oxygen escaped from the apparatus, and an aqueous solution of peroxide of hydrogen was found left behind in the glass tubes. This conclusion is also supported by many indirect proofs. It is shewn, further, that this peroxide of hydrogen is not the direct result of the action of electricity on oxygen, but is formed during the passage of the mixture of oxygen and ozone through potassic iodide. The action of the electric discharge on oxygen, and the formation of ozone and antozone are further explained thus: The passage of electric sparks through *pure* oxygen causes a very small portion of the oxygen operated upon to become ozone. The result of conducting it now through a solution of potassic iodide is, that the ozone not only oxidizes the latter but also some of the water, producing peroxide of hydrogen. That portion of the oxygen gas, which takes no part in these processes, passes on, and carries along with it some of the vapours of water and peroxide of hydrogen, acquiring thereby the properties of the so-called antozone.

Classification of Sugars.—The different kinds of sugar may roughly be divided into two classes, those which are susceptible of fermentation, and those which are not. Sugars are compounds of carbon, hydrogen, and oxygen, and can by suitable treatment be converted into acids. Messrs. Hlasiwetz and Habermann (*Liebig Ann.* clv. 120) have shown that the sugars belonging to the first class (susceptible of fermentation) produce under certain conditions acids which still contain all the carbon of the original sugar, whereas those of the second class produce under the same or similar conditions acids which do not contain all the carbon of the sugar from which they were formed.

Physics and Astronomy.

On the Influence of a roughened Surface on the Emission of Heat.—*Poggendorff's Annalen* for July contains a paper by the late Professor Magnus on the effect of roughness of surface upon the power of bodies to emit heat. Magnus found that the emissive power of polished platinum was doubled when its surface was roughened by rubbing it with fine emery-paper, and was increased sevenfold when it was coated with a thin layer of spongy platinum; no difference, however, could be detected between the quantity of heat emitted by a platinum plate which had been made very hard by rolling, and that emitted by the same plate after it had been rendered soft by annealing. He rejected the supposition put forward by Sir John Leslie and by Melloni, namely, that the effect of roughening is due to the alteration of density which it produces in the superficial layers of the substance, and suggested that it is more probably due to the change caused by refraction in the direction of the rays which leave the surface obliquely. It would not be easy to show the precise way in which Magnus applied this idea to the explanation of the phenomena in question without the help of a figure. One consequence of it, which, as he points out, is in accordance with observation, is that a rough surface is more likely to cause increased emission of heat in the case of bodies which are very slightly diathermanous, in which therefore the total radiation is confined to a very small depth below the surface, than in the case of those which are more diathermanous and therefore radiate from a greater depth below the surface.

Dispersive Powers of Gases and Vapours.—M. Croullebois has determined the indices of refraction of several gases and vapours for the fixed lines C, E, and G of the solar spectrum. His method of experiment was based upon the phenomena of interference produced by two small pencils of light which, proceeding from the same source, arrive at the same point by different paths. It was pointed out more than fifty years ago by Arago, that, the lengths of the paths of the two interfering pencils remaining unchanged, the most minute alteration in the index of refraction of the medium through which one of them passes is revealed by a change of position in the resulting interference-bands. In M. Croullebois' experiments, the two portions of light which were afterwards brought to interfere were made to pass through two parallel tubes placed side by side, and containing the gas or vapour to be examined. The observations consisted in determining the effect of a difference of density of the gas in one tube, as compared with that in the other, in producing a shifting of the interference-bands. In one set of experiments, this was ascertained by actually watching the motion of the bands while the change of density was taking place; and in another set, the effect of increasing or diminishing the gaseous pressure in one of the tubes was compensated by diminishing or increasing the thickness of glass through which the corresponding pencil of light had to pass, and the magnitude of the effect was deduced from the amount of compensation needed. Both methods gave sensibly identical results; but it should be observed that the dispersive power of air deduced by M. Croullebois from his experiments exceeds considerably that obtained five years ago by Ketteler, by a method essentially similar.

A Novel Way of Studying the Stars.—In *Fraser* for October, Mr. R. Proctor applies Humboldt's plan of measuring the relative extent of land and water to the celestial globe. Of the 5850 stars of the first six orders, given in the Catalogue of the British Association, 1115 lie within the Milky Way, a space covering between 1-10th and 1-11th of the celestial sphere; whilst in the rest of the sky two districts of the same size are provided with proportions represented by the figures 13,126 and 2361. The conclusion is that there must be some reason for this unequal distribution of stars in streams and reticulations, and that the Milky Way is made up of small rather than exceedingly distant luminaries.

History and Archæology.

A History of the Egyptian Revolution, from the period of the Mamelukes to the Death of Mohammed Ali; from Arab and European memoirs, oral tradition, and local research. By A. A. Paton. 2nd Edition, enlarged. London: Trübner.

How far is it true to speak of "the fixed and unchanging East"? A closer acquaintance with China shows anything but an unchanging system, and the religious, philosophical, and political revolutions of India and Persia quite match those of Europe. Probably the Semitic nations are chiefly referred to in this sense, as though being imbued with a strong religious feeling they had all along tended to monotheism. The enduring similarity of manners and customs, too, has strengthened this idea; we are all familiar with the biblical illustrations drawn from the modern life of Syria, Arabia, and Egypt. Mr. Palgrave's book however has woefully diminished the importance of the Bedouins, who appear to be by no means fair representatives of the genuine Arabian tribes. And no one who compares the picture of Arab life in Antar (when Chosroes Nushirvan was ruling in Persia) with Palgrave's account of the Wahabee Puritans of modern Arabia could speak of the race as unchanging. Similarly in Egypt. The climate and the river prevent some things from changing, but in all that makes up national or individual life in the higher sense, the Egypt of Ptolemy or Athanasius is as distinct from the Egypt of the Pharaohs as it is from that of Mohammed Ali in our own days. Mr. Paton tries to show us this modern Egypt from something of the Eastern point of view. He knows the condition of Turkey well, as he showed by his *Researches on the Danube and Adriatic*, and his practical experience in political affairs during the crisis that followed the battle of Nezib, and again during the bloody civil war in Mount Lebanon, has stood him in good stead in the present work. The first volume contains a preliminary sketch of Egyptian history from the Moslem Conquest to Napoleon's expedition, which is described at length, with considerable illustration from native writers. But the second volume is the really important part of the book as it shows what political and social and commercial changes followed the rise of Mohammed Ali. In 1808-10 the new ruler (a native of Roumelia who first came to Egypt as Aga of a band of Albanians and Roumeliotes in the Turkish force attached to Abercrombie's expedition) effected a revolutionary transfer of landed property. By a strict inquiry into titles the Pasha became landlord of nearly all the soil of Egypt, and the increase of the taxes very much impoverished the peasantry. The massacre of the Mamelukes prevented any danger from an armed opposition, and having now the whole resources of Egypt at his command, the Pasha began a religious campaign in concert with the Shereef of Mecca and Medina against the fanatical Wahabees. For this part of the history readers ought to compare Mr. Palgrave's very vivid account derived from Wahabee sources of information.

Meanwhile, Sultan Mahmoud had begun to reform the decaying political institutions of Turkey, and soon found that his Egyptian vassal was intriguing with the feudal chiefs of Roumelia. Hostilities broke out with the Sultan, Mohammed Ali pretending only to attack the Pasha of Syria. The result of two successive wars was that Constantinople was only saved by the Western Powers, who drove the Egyptian forces from Syria. Mohammed Ali had with great wisdom abstained from interfering with our overland communication during the war, and at its close the new traffic assumed large proportions. And now, turning from mere history, Mr. Paton in a series of chapters describes the improvements effected by the new ruler, tells how the roads were made secure by a system of police, and the Bedouins turned into breeders of camels and carriers of merchandize; so that from being one of the most insecure countries for a European to visit, Egypt became a land of safety for travellers. The chapters on Damascus and Aleppo have been added in this reissue as companion pictures to that on Cairo in the first, and these with Mr. Lane's admirable accounts of Egypt will preserve to us a picture of what is rapidly passing away. There is also a chapter on the feudal families and mountain races of Syria, which gives a full view of the complicated Druse and Maronite politics of the Lebanon districts. Here as elsewhere the old order of things is changing, as the pressure of Europe is more and more felt. But the beliefs, prejudices, manners and customs of the native population, will change more slowly and gradually. Even in England strange fragments of the old belief in witchcraft exist, and how much more in the East. Lady Duff Gordon's charming letters from Egypt point out the curious contrast of western and eastern customs in the simplest social details, and show us united in actual life much of what Mr. Paton describes in separate sketches. His picture of the distress of the peasantry under Mohammed's oppressive taxation gives us the reverse side of the picture. In 1844 the cattle-plague brought matters to a crisis. When one village had become depopulated by the flight of the peasants, and could not pay its taxes, the burden was thrown on the neighbouring villages, and the treasury allowed of no arrears of payment or remission of taxation. Where there had been formerly a hundred looms, and hand-weaving had fallen off, so that only a third of the looms remained, this remainder had still to pay for the full complement. The magnificent public works were carried on by labour unpaid for by the government, and this was the chief cause of the depopulation. Probably the Pyramids were built in much the same way by the ancient Pharaohs. The native population seems to have suffered more from the new system than from the old, though this was more barbarous and cruel in special cases. Turkish rule has never been otherwise than bad for the subject populations, but the age of transition is perhaps in some respects worse. Mr. Paton adheres, however, to the views of Lord Palmerston, and on the ground of a bird in the hand being worth two in the bush, thinks it best to uphold the Turkish rule. On the other hand, Philhellenic enthusiasm has died out in Europe, and perhaps it may now be possible to discuss with calmer insight the means of improving the condition of the subject races of Turkey, whether on the northern or the southern frontier. C. W. Boase.

A Life of the great Lord Fairfax, Commander-in-Chief of the Army of the Parliament of England. By Clements R. Markham. London: Macmillan, 1870. xiv. and 480 pp. 8vo.

This book could not have been written but by one who was both a travelled geographer, as Mr. Markham was known to be, and also a learned and critical scholar, as we discover that he is. It may be that, besides the charm of his hero's character, some family feeling, natural and, when not paraded, honourable, led him to this happy choice of a subject. At any rate, we have here an aspect of part of the Civil War fully, and on the whole fairly, presented.

Perfect impartiality in writing about the Rebellion was long prevented by the strength of tradition. And when tradition had practically ceased, the passionate exaggerations of Hume and Horne Tooke were repeated by Disraeli and Brodie. Thoughts suggested by the close resemblance between modern politics and those of the middle of the 17th century, taking the place of tradition, have made Mr. Hallam, still more Mr. Sanford, Mr. Forster, Mr. Goldwin Smith, Mr. Markham, partisans rather than philosophical historians. To an unprejudiced student of the m.s. and printed documents of the time, Mr. Hallam now appears not only to belong to the old world, but to be unjust; nor does his injustice seem more amiable because he ill-treats Cromwell as much as he ill-treats the king: and to such a student Mr. Markham's undercurrent of anger with the royalists and disparagement of their efforts imparts a suspicion of the weakness of his side. However, if party pamphlets illustrated from annals move in a lower plane than philosophical history, they are at least while they live more generally interesting, and Mr. Markham is not very sour but only subacid.

In his portrait of Fairfax he has had good success. He has made him on the one hand independent and not subservient to Cromwell (pp. 194, 399), wise, brave, modest, and accomplished; he has cleared him on the other in these pages (pp. 328 foll.) and in the controversy which they have provoked, from the charge of cruelty brought against him: he has, in short, justified the application to him of the epithet "great," used in the affected sense of great if compared with the others who have borne the title (p. viii.). He admits that Fairfax, though a soldier and a man of honour, had no head for politics; but the age was one in which men were singularly versatile; and, to take a somewhat similar case, the Duke of Wellington's, though, as Mr. Stapleton said in one of his books on *Canning*, he failed in statesmanship through the very qualities which made him a general, his failure was very different in degree from Fairfax's, and argued unsuitability rather than incapacity. (See Markham, p. 400.) The Duke, in short, could never have been called by an opponent, as Fairfax is in *The Rump carbonado'd*, "Tom Fool."

In Lafayette, nominated in 1789, during that brilliant period in French history in which everybody was an enthusiastic reformer, which is so like the period in our own history before the meeting of the Long Parliament—in Lafayette, nominated to the command of the National Guard, his sister-in-law, the Marchioness of Montagu, "beheld another Lord Fairfax at the head of a parliamentary army, which was opposed to that of the king." The parallel is worth pursuing, though the pursuit cannot be long.

One or two mistakes in Mr. Markham's account of the Fairfaxes may be noticed. Speaking of the family (p. 409, n. 1) he says that the Rev. Brian Fairfax "succeeded" as the eighth lord: that is one way of stating that the House of Peers resolved and adjudged that he had made out his claim to the title, *i. e.* that the barony was confirmed to him. We are not told the end of the Fairfax Horn (p. 181, referring to *Archaeologia*, i 168—not 186): it was given by the eighth or by the ninth Lord Fairfax to his godson and connection, Mr. Fairfax Fenwick, from whom when in New Zealand it was stolen. He seems to be unaware (p. 14) how common in Charles the First's time and even in his eldest son's was the sale of titles from baronetcies upwards: this "merchandise of honour" is deplored by Clarendon (*History*, bk. 1: comp. Defoe's *Memoirs of a Cavalier*, pref. to ed. 2); and gifts of "baronetcies," that is, of the right to nominate men for baronetcies, were got by Farrer (Bruce's *Kalendar of State Papers*, 1631-3), by Acland, by Lord Airth and Menteith (Mrs. Green's *Kalendar*, 1661-2). Is our own system so much better?

As to military matters, a few points seem to have been missed by our author. Far as his book is superior to Sir Edward Cust's, in which Charles is treated as a warrior, it fails no less completely to represent in the true light the soldiers of the day: these were of course not a standing army, but for the most part armed citizens—citizens very badly armed and very badly drilled. Such soldiers wished, and therefore thought, with Baxter, "that a very few days or weeks by one or other battle would end the war," "so wise masters of war" were they; and it was some time before they came to treat the thing with the coolness of which he speaks. Nor does Mr. Markham take the hint given by Mr. Pearson (*Hist. Maps*, p. vi.), and shew, as Mr. Goldwin Smith used to shew, as displayed in the war, the connection of the politics and religion of the country with its physical condition. To come to details, the letter from Goring to his son (17th April, 1643), and those from Ferdinando Fairfax and from Stockdell to the Speaker (23rd May, 1643) deserve mention. Mr. Markham's account of affairs at Bristol, though it would admit of more "local colour," is the best which has appeared: Mr. Turnor's memoir is useful, and so are a few other monographs; the difficulty, the impossibility, of restoring the lines from the railway stations, perhaps from the east end of Port Wall Lane, to Prior's Hill, a flat space built over and cut up, might have been stated; the fact that the plague did not attack the besiegers, a phenomenon said by Rabelais to have been observed at Seville (i. 27), the rising of the "clubmen"—a rising such as Rabelais again describes (i. 50), the belief imputed by John Coke to a parliamentary soldier that "Jesus Christ tooke Bristoll," are worth remarking. Gomez (p. 213) may be the De Gomme quoted by Mr. E. Warburton, and so often mentioned in the Carte papers. Mr. Markham gives us the battle of Long Marston Moor in great detail and with great clearness, better than Mr. Sanford: he might have referred to the poem by "*Paganus Piscator* (Payne Fisher) *militum serviens major*," and afterwards Oliver's poet laureate. Fisher, first at Hart Hall and (under Bishop Barlow) at Queen's, Oxford, then at Magdalene, Cambridge, was a prolific writer, as impartial (say rather, as "bipartial") as Waller, though immeasurably beneath him: his authority, though not great, is considerable; the Bodleian copy of the poem, once Bishop R. Rawlinson's, has the Cromwell arms on it. Mr. Markham, indeed, bears hardly on Oliver's conduct as to this battle. Then come a few slips with regard to the movements round Oxford, some of which have been pointed out to me by Colonel Rigaud, who has also favoured me with the loan of his pamphlet (1851) on the fortification of Oxford, one which, with Mr. V. Thomas's (1850) and Mr. Parker's article in *The Gentleman's Magazine* (1861), I venture to recommend. Our author has not explained why the Parks, the name of which is generally connected with the term "a park of artillery," are called by Wood (*Hist. and Antiqq. of Oxf.* 1642), "the New Park": nor what the Old Park was? He rightly says that, the water-meadows being flooded, the city could not be approached

on the north, *i.e.* the Woodstock side; but why does he place Headington on that side? It is of course on the east, and Fairfax chose it as the only place whence his guns would have any "command" or annoy Oxford much (p. 269). Mr. Markham has forgotten, I think, Fairfax's attempt to storm Boarstall House in Buckinghamshire, after what Wood calls "the mock show at Oxford" was over, and the parliamenteers had grown tired of vapouring. It is too much to say, as Mr. Markham does (p. 370 n. 1), in speaking of the Bodleian's debt to Fairfax, that the Dodsworth m.ss., part of his bequest, are more used by students than any others there: "student" is too fine a description of the ordinary genealogist, and these documents are chiefly genealogical. Later on there are a number of letters from and to Fairfax and his army (1647: June 14, 24, 25; July 1, 5. 1648: November 18. 1649: January 1, 15, 20) all published as soon as written, which throw some light on the relations of the military and the parliament, and explain why Butler speaks of Fairfax's behaviour at this time as that of a "great croysads general"—a quixotic politician. It may be added that "Sandford" (p. 48 n. 2), "Masere" (p. 393 n. 1), and "Asterley" (p. 408 n. 3), are misspelt.

Lest any wrong conclusion should be drawn from this notice, it should be said that Mr. Markham's book is not only likely to remain the best on the subject, but in itself good, complete (even to the point of describing the pictures of Fairfax), and readable, that the maps are excellent, and that the criticisms here made upon it are meant as suggestions for a new edition. R. Robinson.

The Man with the Iron Mask. By Marius Topin. Translated and edited by Henry Vizetelly. London: Smith and Elder, 1870.

The legend of the Man with the Iron Mask has long ceased to interest the European public, and retains its hold on the minds of professional scholars simply as an historical puzzle whose solution would at once set a vexed question at rest, and exalt the reputation of some fortunate investigator. M. Topin, a well-known French writer on historical subjects, has confidently announced that the book now before us presents a satisfactory and final solution to the enigma. Prior to the exhibition of his argument for the identification of the prisoner he passes in review the personages, real or hypothetical, whom various authors have professed to discover under the Iron Mask. To each of these a biographical sketch is devoted, which closes with evidence demonstrating that its subject could not possibly have been the masked captive. And as none of the theories thus dismissed would now find a respectable advocate, the negative results of M. Topin's investigations may be considered conclusive. The counter-hypothesis he sets up is one of old date revived by Delort in 1825, but his adopted theory is defended by a line of reasoning both new and forcible, based upon a series of inedited original documents. It identifies Mattioli, the Minister of the Duke of Mantua, kidnapped by Louis 14th in 1679, with the mysterious captive who died in the Bastille 1703. His argument is as follows. In 1679 when Mattioli was brought to Pignerol, that fortress contained only four obscure persons confined for insignificant crimes, none of whom could have been the Iron Mask. The fact that the ex-minister and the dropsical prisoner who died in 1687, at Exiles, were different persons, is fully established by M. Topin's discovery that the former was left at Pignerol when St. Mars exchanged his government for that of Exiles in 1681, and was not again under his charge till 1694. St. Mars at that date had become governor of the *Iles Sainte-Marguerite* where before Mattioli's arrival his prisoners were insignificant and he consequently obtained frequent leave of absence; after that event all precautions were redoubled, and the indefatigable gaoler never again left the Islands until the final transfer of himself and his prisoner to the Bastille. When the latter died in 1703, he was buried under the name of Marchialy—an evident corruption of Mattioli, argues M. Topin.

Strong as M. Topin's position appears at first sight, no doubt remains but that the Mantuan Minister must hereafter join that ingenious author's procession of false Iron Masks. For the theory falls utterly to pieces under the criticism of two writers in the *Revue Contemporaine*. M. Loiseleur and M. Jung produce evidence which clearly identifies the masked captive with a man described by M. Topin as "insignificant and obscure," who was incarcerated at Pignerol, April 7th, 1674, five years previously to Mattioli's arrest. In a letter from Louvois to St. Mars notifying his arrival, he is designated as "un prisonnier lequel, quoique obscur, ne laisse pas d'être homme de conséquence." This nameless captive was to be treated as of inferior rank, but the orders for his safe keeping are marked by a minuteness of detail and an excess of reserve and precaution which at once stamp him as a prisoner of the highest importance, and leave on the mind a tragic impression of the long death in life to which he was doomed. M. Topin's discovery that Mattioli was left at Pignerol would of itself be fatal to his hypothesis, for his critics demonstrate that the Iron Mask accompanied St. Mars both to Exiles and the Islands, and was indicated in the well-known despatch of 1691 as "the prisoner who has been under your charge for twenty years." And finally, Mattioli really did arrive at the Islands in April, 1694, but before the close of the month he was dead, a fact proved by a despatch relating to the disposal after his decease, of a valet who had all along shared the unfortunate Minister's captivity. The Mattioli hypothesis thus set aside, the following facts are established by M. Topin's critics respecting this historical enigma. Two captives guarded by St. Mars with extreme strictness, to whom he refers in his correspondence with Louvois as "Messieurs of the lower tower," were the Iron Mask and a companion prisoner. Both were brought by him from Pignerol to Exiles under express orders from Louis XIV., the reason assigned being that to his hands alone would the king entrust so important a charge. One of these men died in 1686, and consequently St. Mars arrived at the Islands with the masked captive only, who from the hour of his imprisonment at Pignerol to that of his death in the Bastille nearly thirty years afterwards was never out of the keeping of his famous gaoler. George Waring.

Intelligence.

The Egyptian Collection of the late Mr. Robert Hay has been temporarily transferred to the Egyptian Court at the Crystal Palace, where they are now on view. The objects are described in detail in the *Times* of October 12, and a catalogue of them has already been published.

Contents of the Journals.

Von Sybel's historische Zeitschrift, 1870. Drittes Heft.—C. Hegel reviews von Maurer's History of the German town constitutions, and discusses his view that they were developed out of the village arrangements previously existing. The town in fact was organized just like the country, and this was certainly the case also in England during the Anglo-Saxon period. Now it is needless to say the town and the country have entirely different modes of organization.—Usinger gives a summary of Koppmann's edition of the city accounts of Hamburg, curiously illustrating the social policy of the Middle Ages, and showing how a small town in the district of Holstein became one of the great Imperial cities. Many of the original documents perished in the lamentable fire of 1842, but Lappenberg had fortunately taken copies and extracts some time previously.—Von Kronall shows from Kessler's "Sabbata" (written at intervals of "rest") the influence of the Reformation on Swiss religious life from 1523 to 1539; the natural

growth of the opposition to Luther's views on the Eucharistic questions is well brought out.—Kessler gives a sort of history of S. Gallen, where he was at the head of the reformed ecclesiastical system.—A Von Reumont graphically describes the episode of the age of the Revolution, in which Manfredini and Carletti tried to bring about a union between Tuscany and the French Republic, and naturally failed.—Bluhme explains the nature of the "pactum de Leburiis," *i. e.* Terra di Lavoro (called in Pliny "Laboriae"), the splendid district between Capua and Naples, but which in the Lombard times was the "Debateable land" between the Lombards and their southern neighbours. The pactum in question contains conditions about the slaves and the "tertiatores," the latter being probably the free landholders, who had to pay a third of the produce to the German conquerors.—A series of smaller reviews relate to German local histories, and to the latest contributions to Church history; the former are specially valuable as relating to the rise of Prussia. A justly severe criticism on Earl Stanhope's "Reign of Anne" characterises the book as containing little more than a series of compressed Annual Registers without insight into the continuous development of events or the real motives of the leading states and statesmen.

Aarböger for Nordisk Oldkyndighed og Historie, for 1869, Copenhagen, contains some valuable contributions. 1. A small treatise (pp. 185–202) by Kornerup, on the old timber churches in Denmark in the early Middle Ages. All the earliest churches in Scandinavia were of timber, and in a peculiar old style, which may partly have been derived from the old heathen temples, of which only descriptions are extant. The doors, pillars, and windows were ornamented with fine carvings, representing fabulous animals; most of which, however, have long since mouldered away or been destroyed by fire. A fine specimen of a church door from Iceland, preserved in the Archæological Museum in Copenhagen, is among the few remains which are left. Norsemen, as well as their nearest kinsmen, the Icelanders, were skilful carvers in wood and walrus. Some of the old Norse "Stave-Kirks" still exist (Borgum, Hitterdale), but in a tottering or restored state, whereas the Danish are all gone, the last of them having been destroyed about 200 years ago.—2. An interesting essay (pp. 203–217) by Prof. Worsaae on a cairn in Mammen, near Wiborg. This "howe" was for the first time opened in 1868, and is supposed to belong to the end of the Heathen Age. Prof. Worsaae mentions a curious fact hitherto unnoticed, that the grave itself (the burial-room or grav-kammer) is not, as usual, above the earth in the cairn, but is dug nearly nine feet deep beneath the centre of the cairn; this gives some hope that some other cairns, which formerly have been explored in vain, may after all be found to contain remains. In this instance the discovery seems to have been made by peasants, and the fittings of the grave were roughly handled and partly destroyed. But the following day an antiquary was on the spot, and succeeded in saving the greater part. The description of the grave-chamber is important, as illustrating to some extent the furniture of the ancient house, on which we have reason to believe it was modelled. Amongst other objects were found some pieces of wax candle, not cast but kneaded, and weighing about eight lbs.; similar pieces have been formerly found in cairns at Jellinge and elsewhere, but were believed to belong to howe-diggers or cairn-breakers; but this instance, taken from the interior chamber, is quite decisive. There were also shreds of clothing or drapery, woven and embroidered with figures; and also shreds of embroidered silk, a bracelet, a belt of the same material; the blade of a battle-axe, chased with gold; some shreds of fur, shreds of down pillows, &c.—3. An interesting chronological and topographical essay on the battle of Swolder (pp. 283–310), by Herr Jörgensen.

The Pahlavî Language. [*An old Pahlavî-Pâzand Glossary*, with an alphabetical index by Destur Hoshangji Jamaspji Asa; revised and enlarged, with *an Introductory Essay on the Pahlavi Language.*] By Martin Haug, Ph. D. Published by order of the Government of Bombay. Bombay and London, 1870.

The Indian Parsees are a striking example of the degree in which a nation or a religious community is capable of forgetting itself, its history, its religion, and the language of its sacred writings. The Parsees, like the Jews, were destined to be dispersed amongst alien populations. But it is a remarkable fact that, whereas the Jewish dispersion had already taken place for centuries at a time when the Zoroastrian was still the leading power of the East, the maintenance of their specific tradition is at the present moment incomparably stronger amongst the Jews than amongst the Parsees. What is the reason of this? Religious enthusiasm is not wanting among them, and the history of the Parsees in Kerman shows that they could bear as much ill-usage as Christians received at the hands of their Mohammedan, and Jews from their Christian, oppressors. In India, we believe, the great likeness in doctrines and cultus between Hinduism and Zoroastrianism was a chief reason why the Parsees lost sight of the characteristic peculiarities of their own tradition, and adopted in many respects that of the Hindus. Whatever may have been the cause, certain it is that the modern Parsees have lost the key to their religion and literature; and not less so that it can only be regained—if at all—by the efforts of European scholars.

The first impulse in this direction arose in France. Near 100 years ago Anquetil du Perron went to India as a private soldier, and contrived to gather from the priests in Surat a knowledge of the language of the Avesta, of its translations, and an insight into the customs and religious observances of the Parsees. The oldest document of Iranian antiquity, the Bible of Darius and of Xerxes, was thus for the first time opened to the European world. The study became a rage in almost every country of Europe except England; and scholars of all kinds looked forward to important revelations from this quarter. Since that time, and especially within the last forty years, the subject of Zoroastrian literature has been brought within the range of accurate philological research, and is taught generally in connection with Sanskrit studies in almost every German university of importance. The bearing of the study upon European theological research is also not to be forgotten. There is a certain connection between many of the characteristic ideas in the Old Testament and the doctrines of Zoroaster. At present this is more to be guessed than clearly understood, and we are not yet in a position to say in what way, at what time, or under what circumstances, this interchange took place. Ezra, who was so closely connected with the restoration of the old Jewish documents, seems to be a natural medium of communication between the two religions.

What then is the so-called Pahlavî language? This question, the answer to which Dr. Haug has here undertaken to give, is one of the most difficult problems in Iranian philology. To begin with, Pahlavî is the language of the oldest translations of the Avesta. In its written form it is a curious mixture of Semitic and Iranian words. By far the greater part of the vocabulary is undoubtedly Semitic: the grammatical terminations, on the other hand, are as evidently Iranian, which has led Prof. Spiegel to regard the Pahlavî language as an organic whole, and of Iranian origin. As to the original meaning of the word Pahlavî, it seems to be certain that it means the language of Pahlaw, and that this

"Pahlaw" was the name of a tract of country in Arsacidan times more or less accurately corresponding to old Media. In New-Persian, Pahlavî means vaguely "Old-Persian;" and a multitude of books are represented by Muhammadan and Zoroastrian authors, as "translations from the Pahlavî." This however is only a form of expression, with no pretence of being literally true. The recollection of old Persian, and particularly of Sassanian times, is and was always very dim: only a few names have come down to the Muhammadans, and these, like Ardashîr Bàbekân, Adharbâd Mahrasfand, Shapur, Nushirvan, Buzurjumihr, are introduced by later authors for the purpose of giving an antique and venerable aspect to their own compositions; and it became a habit to represent the wisdom which was put into the mouths of these half-forgotten worthies as uttered or written in Pahlavî, For this we could adduce dozens of proofs from the bulk of Persian literature. Originally the name of the dialect of a province of Iran, it is used, as we have said, in general for old Persian. How did this happen? Was the province Pahlaw so all-important that its dialect spread over the whole of Iran and was called Persian *par excellence?* Of this question, the assumption that the chief literature which existed in those times was composed in this dialect,—whilst the Khûzî, Fârisî, and Darî were comparatively illiterate languages, seems perhaps to offer the most satisfactory solution.

But now there is a further question, viz., whether the language of the translation of the Avesta and the cognate literature, hitherto called Pahlavî, is the old Median dialect. P. de Lagarde (*Gött. Gel. Anz.* Sept. 14, p. 1459 foll.) thinks that it is not. But though Neriosengh writes the new Persian form of the word, and uses it probably in the same vague sense which we have already noticed,—this fact, if it does not prove Pahlavî to be the old Median dialect, does not on the other hand exclude the possibility of its being so. Here we speak only of the Iranian part of the language; and against the second argument of Lagarde (ibid. 1461) regarding the Semitic part, we reply, that the language, as it is written, never formed an organic unity. As it is exhibited by MS. tradition, it is certainly not the dialect of Media, simply because in this form it was never spoken by anybody. We may here add a few words against another remark of Lagarde's (ibid. 1467). He observes, firstly, that the Pahlavî-Semitic looks like a *pot-pourri* from a variety of dialects; but this criticism is more applicable to the present manner of treating the subject than to the subject itself. We have already explained elsewhere (see *Zeitschr. der d. morgenland. Gesellsch.* tom. xxiii. p. 509), that the comparison of any other language but Aramaic with Pahlavî is quite out of the question. If, besides, many of the Pahlavî forms look extremely improbable, we must remember that our knowledge of the alphabet is far from being perfect. When we shall have gained an accurate knowledge of the alphabet, of the principles of orthography, and of the nature of the combination between the Semitic and Iranian parts, it is my belief that we shall be able to recognize a dialect purely Aramaic, closely related to those already known, but with certain peculiarities of its own.

Starting from the undoubted fact that the priests, in reading Pahlavî, substitute Persian words for the written Semitic ones, which seem to be utterly unknown to them, and combining this with a statement of Ibn Muḳaffa to the same effect, Dr. Haug thinks with very great probability that the Iranian terminations in the writing were meant to indicate the Iranian words which were to be read; and he regards the Semitic of the true Pahlavî as identical with that, in two dialects of which the celebrated Hâjiâbâd inscriptions are written. There is no doubt that this method is one which deserves to be followed, and is likely to lead ultimately to valuable results.

Whether Dr. Haug's new interpretation of these inscriptions is one which will commend itself to scholars generally is another question, though we willingly admit that he has made appreciable progress. The fact is, these inscriptions, found in the little Mesopotamian village of Hâjiâbâd, have been for fifty years the crux of Iranian scholarship. De Sacy deciphered the first lines containing the name of the king commemorated, and his titles; and further than this, the life-long researches of the best Iranian scholars of Europe has hitherto not succeeded in penetrating. Dr. Haug's explanation of the word ḥatyâ as = Hebrew חַיָּה (of which the Syriac ܚܰܝ̈ܳܐ is the feminine) is interesting, and almost certainly correct. A few minor points which he has made out appear to us probable, or at least possible: but the vast bulk of his interpretations we cannot but regard as more than doubtful.

The Pahlavî Pâzand glossary, now edited for the first time in its original form, is a very valuable addition to our printed stock of this branch of eastern literature. We must acknowledge the combined efforts of Destur Hoshangji and Dr. Haug to make it as useful as possible by a transliteration into Roman characters, a literal translation, and an alphabetical index. It is neither complete nor free from mistakes, but it is inestimable, as exhibiting the traditional knowledge of a great part of the language at present current among Parsee priests. Dr. Haug has attempted an etymological explanation of each word in detail, with what success the learned reader will be able to judge.

The Bombay Government, by whose order this work is edited, certainly deserves great credit for paying so much attention to the tradition of one of the smallest but most enlightened and wealthy portion of its subjects. On the other hand, the duality of authors is by no means conducive to the interests of science. The task of editing works of this kind, too, demands accomplished philological scholarship, and of this the Indian Destur, at least, is entirely innocent.

Ed. Sachau.

PROGRESS OF HEBREW GRAMMAR.

Those scholars who are interested in Hebrew as a branch of comparative philology, have long been anxious to render some part of their results available to the beginner, and thus to convert that congeries of empirical rules commonly called Hebrew grammar into an intelligible system. Of the larger grammars, that of Justus Olshausen (Brunswick, 1861) holds unquestionably the first place, for its fidelity to the comparative method, but the utility of that admirable work is thought by some to be impaired by occasional inconsistencies. However this may be, it is certainly too elaborate for general use, and Prof. Land has done well to abridge and simplify its contents. (See his *Hebreewsche Grammatica*, Eerste Stuk, Amsterdam, 1869.) He has succeeded in accomplishing this without detriment either to theory or to practice, in the compass of 182 pages, as against Olshausen's 676; and we envy the students who, with this book in their hands, are spared the vexatious process of unlearning erroneous notions. We trust the second part of this Hebrew grammar, containing the syntax, will not be long delayed. Even after Ewald's magnificent attempt, which constitutes one of his fairest claims to distinction, there are obscurities enough in the subject of Hebrew syntax to tax the patience and the ingenuity of an accomplished scholar.

The work referred to, however, is but ill adapted for those whose minds have been preoccupied by another grammatical system. For the benefit of this numerous class, and especially of teachers of Hebrew, Dr. Land has published a detailed justification of his views in the January number of the *Theologisch Tijdschrift*. He there insists strongly on the fact that the system of vowel-points grew up entirely apart from philological theories. The object of its inventors was a purely practical one,—to preserve the pronunciation of the sacred language from the infection of Aramaic, which for more than 1000 years had been the vernacular of Palestine; and the standard which they adopted was the practice of the most eminent Rabbis. Two or three centuries after the invention of our system of vowel-points appeared the Jewish grammarians, who began to bring the regularly

recurring phenomena of the pointed text under general rules. These phenomena they explained, with various success, by the help of Arabic and of the Arabic grammarians; and this work, which was systematised about the year 1200 by David Kiurchi, became the foundation of all subsequent Jewish and Christian grammars. It is this unhesitating adoption of the theories of the Jewish grammarians which Dr. Land assails in this essay. "The great point of distinction," he says, "between the prevalent and the recent method consists in this:—while other scholars take as their basis the punctuation together with the Jewish exposition of it, and content themselves with amending some details of the latter, I, on the other hand (as Olshausen has not entirely emancipated himself from the earlier doctrine), take my point of departure in the pointed text alone, and subject the work of the old masters to a searching criticism, in accordance with modern philological views." He then lets the reader witness his method of criticism, and comments on the absurdity (as he thinks it) of the prevalent theory, according to which four out of the seven vowel-points (reckoning qibbuç and shureq as one) are of doubtful quantity, and one of them (ֻ) even of doubtful sound, so that the student must have a good knowledge of the grammar to decide between the alternatives, a grammar, be it observed, which had yet to be discovered, when the system of punctuation was introduced. It is plain, too, from various minutiæ of the system, from the metheg, the shevas, and half-vowels, that it was intended for readers who had no idea of language as a study, and for whom it was necessary to prescribe every particular in the pronunciation, to prevent them from stumbling at every turn. Now can any one believe that the inventors of the system would have expressed so important an element of pronunciation as quantity in so inadequate a way, if they had really been acquainted with it? And if they were unacquainted with quantity, it follows that it had no existence in their time, that the distinction between long and short vowels had perished, and that the vowel-signs (as in modern Greek and the languages of western Europe) are marks of sound, *and nothing more*. The reason of this, Dr. Land continues, is not far to seek. The Syriac system of punctuation recognizes only two vowels, an *e* and an *o*, and has abandoned quantity even in the case of consonants (*i. e.* there is no doubling of consonants). Hence, to the powerful influence exercised on Hebrew by Aramaic, we may ascribe the existence of analogous phenomena in the pronunciation of both languages.

But how came the Jewish grammarians, whose work forms the basis of our modern grammars, to imagine that the vowel-points denoted quantity? Simply from their imitation of the Arabic grammarians, and the comparison of apparent analogies in the Arabic language. Among other evidence of this is the circumstance, that they made no distinction between short and long segol, because there was no analogy for this in Arabic, and thus left a hole in their theory, while on the other hand they distinctly recognized a long and a short qameç (בָּתָב, *kitāb*, -כָּל, *kull*). Not that their imitation of Arabic grammarians was a servile one; they tell us plainly that the quantity of vowels in Arabic was dependent on other laws than those which they discovered in the Hebrew punctuation. In the former, the quantity of the vowels is almost always unalterably fixed; in the latter it is liable to change, as soon as the syllable in which the vowel stands undergoes an alteration. And so the Jewish grammarians came to distinguish between vowels essentially long, which remain the same, whatever be the fate of the syllable, and vowels which are long only rhythmically, *i.e.* through the influence of the accent, or through the opening of a syllable. But though in itself nothing is simpler than that in a syllable of two sounds the vowel should have to bear greater stress than when a third sound has to be uttered in about the same time, this does not account for the strange alteration in character which such a vowel undergoes. However much we lengthen *ŏ*, we can never produce a sound like the *ô* in *nôtre*, let alone an open *ó*, but merely one like that in the French *mort*, *sort*. So too by lengthening *ĕ*, we can only get the *e* of *père*, never that of *tête*, let alone that of *pré*. This part of the prevalent theory, therefore, calls loudly for revision, especially when we see מַלְכִּי arise out of מֶלֶךְ, where no one can account for the segol by a mere lengthening of the patach. We may indeed assert that the lengthening of a vowel involves an alteration in the character of the sound, or perhaps deny the lengthening, and maintain that the accent, or the opening of the syllable, alters the character of the vowel, but in neither case can our hypothesis be justified by argument. There is but one resource, says Dr. Land, and that has been adopted in the new theory, viz., to suppose that the accent or the opening of the syllable brought about the lengthening of the vowel, and that the difference in quantity thus produced was afterwards exchanged for a difference in sound, which is in fact all that has survived. But we may naturally ask, Why has quantity been forced to give way to a new variety of sound? It was inevitable. When the short vowels had been equalized in length to those essentially long, a great danger arose of confusing the two classes of vowels, and so of missing the true meaning of a sentence. This could only be guarded against by giving the lengthened vowel a fresh *nuance* of sound, a *nuance* which gradually expelled that element of quantity, of which it was originally the safeguard. The order of the changes experienced by the Hebrew vowels is thus given by Dr. Land:—1. An original distinction of quantity, of essential importance for the formation of words (primitive vowels, *ă*, *ā*, *ĭ*, *ī*, *ŭ*, *ū*, *ai*, *au*). 2. Lengthening of short vowels in an open syllable or through the accent, and adjustment of diphthongs; the point at which the confusion in the ancient quantity began. 3. Attempt to support quantity by introducing a difference in sound. 4. Difference in sound without quantity (Masoretic vowels, *a*, *ĕ*, *é*, *i*, *ŏ*, *ó*, *u*). Thus the intricacies of the old theory are disentangled into an intelligible historical process, the commencement of which indeed cannot be determined, though a careful investigation of the data proves to a certainty that the Masoretic pronunciation arose under Aramaic influence. This is the fundamental doctrine of Dr. Land's Hebrew Grammar, supported by a constant reference to the other Semitic languages, in order to infer the original forms of Hebrew pronunciation. It is not thought too difficult for Dutch beginners; whether it is so for English must be decided by experience. T. K. Cheyne.

Intelligence.

An Oriental Literary History.—The late Prof. E. Flügel undertook towards the end of his life to edit the *Fihrist-al'ulûm* ("The index of sciences") by Muḥammad b. Jsḥâḳ, who dated it himself A.H. 377 (A.D. 987). It is a kind of literary history of the East; and the information which it contains is so rich and precious, that an edition of the book ranked foremost among the desideria of all scholars concerned in Oriental researches. After the death of Prof. Flügel, Dr. J. Roediger has been chosen to see the book through the press, under the superintendence, as we understand, of Prof. Fleischer. An enumeration of its contents is given by Prof. Flügel in the *Zeitschrift d. deutschen morgenl. Gesellschaft*, tom. xiii. p. 559.

The Structure of the Odyssey. [*Die Composition der Odyssee.* Gesammelte Aufsätze, von A. Kirchoff.] Berlin: Hertz, 1869.

The Mythology of the Odyssey. [*Altgriechische Märchen in der Odyssee.* Ein Beitrag zur vergleichenden Mythologie, von Dr. Georg Gerland.] Magdeburg: Creutz, 1869.

Homer and the Odyssey. [*Homer und insbesondere die Odyssee*, von H. Steinthal.] Zeitschrift für Völkerpsychologie und Sprachwissenschaft, vol. vii., pt. 1.

According to Dr. Kirchoff the *Odyssey*, as we have it, is neither the creation of a single poet, nor a series of inde-

pendent "lays" mechanically strung together: it is the result of successive additions made to an original nucleus. There was first of all, he thinks, an ancient "Return of Odysseus,"—not a mere "lay," but a poem of two thousand lines or more—in which the adventures with the Cyclops, Calypso, and the Phæacians held the chief place; then a continuation (the bulk of books xiii.-xxiii.) which carried on the events in Ithaca to the death of the Suitors and the recognition by Penelope. The epic thus formed, which was older than the Cyclic poems and the beginning of the Olympiads, was afterwards recast and enlarged, at some time between Ol. 30 and Ol. 50, partly in order to bring in new matter—especially the fables connected with Circe and the adventures of Telemachus—partly in order to round off the whole by a conclusion after the Cyclic taste of the period. Lastly a few passages were interpolated at the time of the Pisistratidæ. In a former work (*Die homerische Odyssee und ihre Entstehung*, Berlin, 1859) Dr. Kirchoff printed a complete re-arranged text of the *Odyssey*, exhibiting his theory to the eye in a clear and convenient form, but without giving more than slight hints of the grounds on which it rested. The papers now collected were published from time to time in different critical journals, most of them dealing with single points of their author's system. It is evident that a work put together under these circumstances is not well fitted to do justice to a view whose value depends wholly or chiefly on its success as a single hypothesis satisfying a number of different conditions. There is some difficulty, notwithstanding the clearness and precision of Dr. Kirchoff's treatment, in making out how much these dissertations are intended to prove, and how much is left to future investigation. It will be convenient to begin with those parts of the book which bear on the main problems of the subject.

The third and fifth dissertations are occupied chiefly with books ix.-xii., in which Odysseus recounts his voyages from the taking of Troy to his escape from the island of Calypso. Dr. Kirchoff makes it probable, by a combination of slight but suggestive traces, that the first brief account which Odysseus gives of himself to the Phæacians (vii. 240-297) has been tampered with; and that in the original version he made himself known at once, instead of keeping his name secret until the second evening. He infers that this second "apologue of Alcinous," which now begins with the revelation (ix. 19) εἶμ' Ὀδυσεύς, κ.τ.λ., is due to the later redaction. He then endeavours to show—less successfully as we think—that the stories of book ix. (the Kikones, Lotophagi, Cyclopes) belong to the oldest poem, while those of x. xi. xii. (Æolus, the Læstrygonians, Circe, the descent into Hades, the Sirens, Scylla) are probably not earlier than Ol. 30. The grounds for this view are somewhat difficult to estimate, since they have to be gathered from more than one part of the book.

1. In the fifth paper (pp. 107 ff.) he argues that the story which Odysseus tells in books x.-xii. must have been originally told of him in the third person, because he is made to relate things which happened in his absence, and which he had no means of ever knowing; whereas in book ix. there is nothing to disturb the illusion that we are listening to the hero's own account in every particular. The argument is worked out with much delicacy and penetration, but from the nature of the case can hardly be conclusive. We cannot say *à priori* how far a Homeric audience would expect a piece of poetical autobiography to preserve its *vraisemblance* in this respect. Even modern writers who adopt this form are apt to ascribe to their hero the omniscience which properly belongs to themselves.

2. At the end of the third paper (pp. 83 ff.) it is maintained that the *motifs* of these three books are taken from the Argonautic fables. Circe is another form of the enchantress Medea; the Planktai or Wandering Rocks are the Symplegades; the Læstrygonians of the Odyssey are the Doliones; and Artakia is a real fountain in the neighbourhood of Cyzicus. Dr. Steinthal has pointed out the weakness of this argument (p. 85). Such resemblances run through all the Greek mythology, and prove at the most a common origin.

3. In the fourth paper (p. 105) it is argued that the Nostoi recognised a son of Odysseus by Calypso, but no son by Circe, and therefore that the poet of the Nostoi (prob. Ol. 20) cannot have known the version which brought Circe into the adventures of Odysseus. Our knowledge of the Nostoi is surely too scanty to allow such a mere argument *ab silentio* to have much weight.

In the second paper Dr. Kirchoff takes the passage where Polykaste washes Telemachus,

> τόφρα δὲ Τηλέμαχον λοῦσεν καλὴ Πολυκάστη,
> Νέστορος ὁπλοτάτη θυγάτηρ Νηληϊάδαο,

and shows very happily how this, which in Homer is a mere incident of primitive manners, was made the basis of a genealogy in the Hesiodic poems. The observation has an important bearing on the date of the *Odyssey*, especially when taken along with Dr. Kirchoff's opinion that the adventures of Telemachus do not belong to the original poem. Unfortunately this is a part of his theory of which the proof has still to be given. The differences which he notices in the same paper between the geography of Homer and that of Hesiod are of the highest interest.

The proof that books xiii.-xxiii. form an "older continuation"—older than either books ii.-iv., or books x.-xii.—is not fully gone into by Dr. Kirchoff: but we gather some of his reasons from the beginning of the sixth dissertation (pp. 135 ff.). He there points out that there are two very different representations of Odysseus to be found in these books. Sometimes he is still in the prime of heroic vigour and beauty, as in the stories of Calypso and the Phæacians, although for a time, by means of the magic wand of Athênê he appears to be a decrepit beggar. Sometimes the change is real and natural, he is simply the veteran upon whom twenty years of war and travel have left their mark, so that even Penelope can hardly be persuaded that it is the same. The discrepancy, however, is one that lies deep in the original structure of the poem. Two different characters—the Odysseus of the Trojan War, the wise and much-enduring king of Ithaca, and the Odysseus of the purely fabulous regions—are fused into one by the specific development of Greek mythology. This may be traced even within the limits which Dr. Kirchoff assigns to his primitive "Return," in the story of Odysseus and the Cyclops. W. Grimm has shown (*Die Sage von Polyphem*, p. 19) that the behaviour of Odysseus in that story is senseless and foolhardy, utterly beneath the heroic type. He compels his companions to wait in the cave of the Cyclops "that he may see him, and get from him a guest's gift" (v. 229): and again, when they have made good their escape he cannot resist twice calling to the blind monster at the risk of destruction to himself and his ship and crew. Such acts do not strike us as strange in a fairy tale; but their true character appears as soon as we think of them by comparison with the temperate and far-sighted valour which elsewhere belongs to Odysseus. Moreover, the story of Polyphemus is found in many countries, in Norway, in Germany, in Transylvania, among the Esthonians, the Finns, the Servians, even in Persia and Tartary; and that in versions which cannot have been derived from the Homeric story. In the *Odyssey* this pri-

mitive and universal fable is found side by side with the comparatively localised fable of the Trojan War. Hence, although we find different conceptions of character, and even although Dr. Kirchoff is able to trace in the poem a consciousness of such discrepancies and an attempt to harmonise them, yet it does not follow that we have the work of more than one hand. The conflict may be not between two poets, but between two different channels of poetical mythology.

This train of reasoning may be carried farther by the help of Dr. Gerland's comparison of the *Odyssey* with an Indian tale in the collection of Somadeva. The adventures of the Brahman Saktideva offer striking parallels to those which in the *Odyssey* are connected with the island of Æolus, Scylla and Charybdis, and the Phæacians. Saktideva is a suitor of the Princess Kanakarekhâ, who will only marry a man who has been in Kanakapuri, the Golden City. After many other adventures, Saktideva was sailing with Satyavrata, King of Utsthala, who, like Æolus in the *Odyssey*, had received the stranger and given him his best help. On the way they found themselves irresistibly driven towards a great fig-tree, which they saw in the distance, and under which Satyavrata knew that there was a whirlpool. Saktideva was saved by the self-sacrifice of his friend, who kept the ship up long enough for him to escape by climbing into the branches of the tree. He was then carried by a gigantic eagle to the Golden City. There, left in a beautiful garden, he was found by two maidens, attendants of the Vidyâdharî queen, Chandraprabhâ. They at once led him into the city to the royal palace, which was supported on diamond pillars and encompassed by walls of gold. After the queen had entertained him for fourteen days, she said to him that the mother of the gods had told her once in a dream that she must have a mortal for husband. "Many as are the noble Vidyadharîs that my father has proposed to me for husbands, I have refused them all, and am still a maiden." She proposed to go a two-days' journey to her father, who had withdrawn in sorrow to the high mountain Rishabhâ, and to gain his consent to their marriage. In the meanwhile she warned him not to set foot on a certain terrace. As in all such tales, he disregarded the warning, and in consequence found himself suddenly conveyed back to his father's house. He then marries Kanakarekhâ, but loses her again immediately; for she was a Vidyadharî, sister to the queen Chandraprabhâ, and only compelled by a curse to remain upon earth until she found a man who had been in the Golden City. In the end, however, he is the means of restoring two other sisters to their original form, and is himself changed into a being of the same kind. They fly through the air to the Golden City, and he becomes husband of all four sisters and King of the Vidyadharîs.

The resemblances between this tale and the Phæacian adventures of Odysseus are obvious. In some other particulars the original identity of the two legends may be traced. Kuvera, the god of riches, is intimately connected with the treasures of the Vidyadharîs, as Hephæstus is with the wonders of the palace of Alcinous. The Vidyadharîs live on high mountains, and are at war with the Rakshasas or demons: the Phæacians had lived in Hypereia (the high city), "near the Cyclopians who did them wrong and were mightier than they" (Od. vi. 4-6). Both are remote and unapproachable by mortals; both have marvellous power of transporting themselves from place to place; both are distinguished by the splendour and happiness of their condition. The differences are no less characteristic, especially the polygamy in the Indian story contrasted with the conjugal fidelity which is so conspicuous in the *Odyssey*.

The darker side of the elf-world in the *Odyssey* is represented by Circe and Calypso. In Somadeva's collection there is a story of a Yakshinî or sorceress, who by her magic turns the travellers whom she finds into animals and then devours them. A young merchant discovers the secret of the charm and by using it against herself, as Ulysses does with Circe, compels her to beg for mercy and to aid him in his enterprise. The same is told of a witch and two brothers in Grimm's *Household Stories*. Even the magical herb *moly* of the *Odyssey* reappears in Germany as *Allermannsharnisch* (Gerl. p. 36). Calypso, again,seems to answer to a Râkshasî, or Giantess: the name points to the dark world with which the northern dwarfs and giants alike are connected.

In common with other writers, Dr. Gerland recognises in the fable of Odysseus "the battle of the wandering sun with clouds and wind and all the powers of darkness, his descent into the world below and his victorious return" (p. 52). Calypso is "the goddess who receives the sinking sun and keeps him for a time" in her western abode: Circe is "the demon of the underworld, who at first meets the hero in hostile guise, but then yielding to his irresistible power, guides him safely on his way to the depths through which he has to pass." Dr. Gerland, however, offers some conjectures which go beyond this comparatively familiar ground. He observes that in nearly all this class of stories the hero wanders from island to island over the sea; and that this feature is not accounted for either by the natural phenomena on which the myth is based, or by the circumstances of the countries in which it is found. India and Germany show it almost as clearly as Greece and Norway. Were then the original ancestors of the Indo-Germanic races, living, as they probably did, on the Oxus and Jaxartes, sufficiently near any great body of water? It is very possible that this was so. It was the opinion of Humboldt, confirmed by recent researches (see Spörer in *Petermann's Mittheilungen*, 1868, 72), that the Sea of Aral is the remains of a great expanse of sea which at no very remote period included the Caspian and the Euxine. The sun therefore may have set for them in the sea; and this setting, according to the way in which it was regarded by the primitive men, was either a journey to a distant island resplendent with golden light, or a dangerous venture into the realms of darkness.

Without entering further upon the wide field of mythology, it may be worth while to indicate the points in which this view differs from that which Mr. Cox adopts in his recent work on Aryan Mythology. Phæacia, according to Mr. Cox, is Cloudland, especially that of the "eastern or western sky as lit up by the rising or setting sun" (ii. p. 275). The ships that sail without oars or rudder are the Phæacians themselves, that is the clouds, "as they sail at will through the blue seas of heaven." Dr. Gerland distinguishes between the Gandharvas, or clouds, and the Vidyâdharîs, or "light-elves:" and he identifies the Phæacians with the latter. They are the genii of the morning, the growing light, as Calypso represents evening, and the "dark elves" represent the night. The difference between these two points of view is far from unimportant; it is, in fact, the question at issue between the two schools of interpretation which Professor Max Müller distinguished as the meteorological theory, proposed by Professor Kuhn, and the solar theory which he himself supported (Lectures, 2nd series, p. 519). It is evident that the progress of comparative mythology must depend very much on its success in deciding between these theories, or, if both contain portions of the truth, in determining with precision the share which each is entitled to claim.

D. B. Monro.

Clementis Alexandrini Opera ex recensione Gulielmi Dindorfii. Oxonii e typographeo Clarendoniano, 1869.

The student of Patristic literature will naturally welcome these four volumes which have recently issued from the Clarendon Press. Archbishop Potter's edition of Clement, the last of any great pretensions, appeared as far back as 1715, and its critical shortcomings have long been felt by modern scholars. The work before us, therefore, is intended to supply an acknowledged want, and it is no exaggeration, and, indeed, no very high praise, to say of it, that it represents the most considerable attempt at the textual revision of Clement since the time of Sylburg. This valuable result, however, is due, in a very limited degree, to Professor W. Dindorf, the present editor. The important but thankless task of examining MSS. appears to have been undertaken for him by others, principally by that most indefatigable of collators, Herr Joseph Müller of Florence. The voluminous notes at the end of the book are a compilation (or very little more) from Segaar, Potter, and previous commentators. Thus the editor's responsibility is in the main confined to the revised text, and the shorter notes, at the foot of each page, in which he gives us (1) a critical commentary on the traditional text, and (2) the references in cases where Clement borrows from earlier writers. The fact of this part of the work having been ready in 1866 must be duly borne in mind, as it clears the editor from the imputation of neglecting the latest contributions to the elucidation of his author.

It would be erroneous to infer that nothing has been done for Clement since 1715. On the contrary, his writings have been constantly in the hands of scholars whose efforts to emend them have often met with the signal success which comes from special knowledge of special departments of Greek philology and literature. Professor Dindorf seems to have formed no adequate conception of the extent and value of this desultory criticism of Clement. It is true that he makes good use of Doehner's *Quaestiones Plutarcheae* and of Cobet's admirable papers in vol. xi. of the *Mnemosyne;* also that an appendix to his preface embodies the further remarks of Cobet in the Λόγιος Ἑρμῆς for the year 1866, when "a great part of the present work was already in print" (Praef. p. xliv). Professor Dindorf, however, omits to state that some of the latter need not have been added thus, as it were, at the eleventh hour, since they were to be found in the *Novae Lectiones* which appeared in a collected form in 1858. As several of Sylburg's corrections, likewise, are mentioned at the same time in the same appendix—hardly an appropriate place for them at least, seeing that they had been before the world since 1592—we begin to feel a suspicion that Professor Dindorf must be somewhat ὀψιμαθὴς in his knowledge of his critical data.

When authorities like Sylburg and Cobet are dealt with in this fashion, it is not surprising that other scholars are treated with much less ceremony: their labours, indeed, frequently meet with no recognition at all. The editor has forgotten to avail himself of the unpublished notes of Markland now in the British Museum. He seems unconscious of the existence of such a book as Bunsen's *Analecta Ante-Nicaena.* In p. 58 (ed. Potter) he retains the absurd ἐκ πάντων αὐτῶν in manifest ignorance of the ἐκ πάντων τῶν ἁπλανῶν of Davies (ad Cic. *de N. D.* i. 13), which has been stamped with the approbation of Krische and others. In p. 500 we still have ὡς τούτων οὐκ ἄνευ for Zeller's ὡς δ' ὧν οὐκ ἄνευ (*Phil. der Griech.* ii. 1, p. 681); in p. 583 ἕρμαιον ὁ θάνατος is unmeaning where it stands, as Wyttenbach remarked (ad Plat. *Phaed.* p. 338, ed. 1810); in p. 586 we still read the senseless κεκορῆσθαι οὐχ ὥσπερ κτήνεσι instead of Bernays' κεκορῆσθαι ὄκωσπερ κτήνεσι; in p. 711 ἀϊδίως ποιόν is tolerated, when a slight familiarity with philosophical Greek suggests ἰδίως ποιόν, as Bernays showed twenty years ago (*Heraclitea*, Bonn, 1848). In another place (p. 461)—a peripatetic extract of some sixteen lines—the editor incorporates three of Bernays' emendations in the text, but omits to explain on what principle he suppresses all mention of the fourth (ἀγνοήσαι for ἀγνοήσας). He is hardly more fortunate when the difficulty is of a very different nature. In p. 404, for instance, he makes Clement ante-date the Exodus by 1000 years, the true reading being clearly χίλια and not δισχίλια (Clinton, *F. H.* vol. i. p. 291): in reproducing the error in p. 409 he intensifies it by printing a monstrous combination of letters, βλκα', which it requires no ingenuity to correct at once, unless one approaches Clement with a Gallio-like indifference to the distinction between sense and nonsense. If the editor's views as to the language of his author may be inferred from the "revised" text, it is clear that our grammars and lexicons also await revision. Ἀντεπίστασθαι (p. 436) is apparently a *vox nihili* (to be supplanted by ἀντεφίστασθαι); Θαλεῖ (p. 396) is not one of the recognised datives of Θαλῆς; it is not generally held that a Greek could say στρατεία (p. 582) when he meant στρατιά, or πρὸς τῇ ἐνεργείᾳ (p. 367) for πρὸς τὴν ἐνέργειαν, or μάλιστα σταθήσεται νόμους (p. 441) for μάλιστα θήσεται νόμους. But enough of this. As a final specimen of the corruptions which still disfigure the text, we must quote at length a passage (p. 402) in which Clement sketches the chronology of Roman history. Having stated that Rome was founded 24 years after the first Olympiad—in B.C. 752 therefore—he proceeds as follows:—

ἐντεῦθεν ἐπὶ τὴν Βαβυλῶνος ἀναίρεσιν ὕπατοι ἐγένοντο ἐπὶ ἔτη διακόσια τεσσαράκοντα τρία, ἀπὸ δὲ τῆς Βαβυλῶνος ἁλώσεως ἐπὶ τὴν Ἀλεξάνδρου τελευτὴν ἔτη ἑκατὸν ὀγδοήκοντα ἕξ.

Although the absurdity of the passage as it stands is "gross as a mountain, open, palpable," it does not seem to have disturbed Professor Dindorf's editorial equanimity in the least. He prints the above congeries of words without misgiving or comment, in happy unconsciousness of the circumstance that Clinton (*F. H.* vol. ii. p. 379) and others long ago decided to substitute βασιλέων for Βαβυλῶνος. The way is perfectly clear. We must insert ὅτε before ὕπατοι (as Lowth did before ὑπάτευεν, a few lines further on), strike out the ἐπὶ before ἔτη, and change ἁλώσεως into ἐλάσεως. Clement, thus simply restored, tells us rationally enough that 243 years elapsed from the foundation of Rome to the overthrow of the monarchy when Consuls were first created, and that from the expulsion of the kings to the death of Alexander was a period of 186 years. But, whatever our view may be worth, we are curious to learn the interpretation which the editor, in this and similar places, would put on his own text. We assume, of course, that to edit a book implies some theory as to the writer's meaning.

An array of facts such as we have been adducing may possibly suggest a twofold question: Has the editor made any serious and consistent effort to render his author intelligible? Has he availed himself to the utmost of the efforts of others in the same direction? Hesiod thinks that mankind may be divided into three classes; those who discover what is right for themselves, those who take the advice of their betters, and those who do neither the one thing nor the other—the last class being characterised by him with antique plainness of speech as ἀχρηΐος, useless or unprofitable. It is not our fault if our readers ask, Under which category, then, would Professor Dindorf come? We confess to a feeling of some surprise at the grammatical blots which still keep their place in the text, notwithstanding its revision by so practised an editor. One explanation of the fact we

may perhaps venture to set aside as improbable: "Ego sum editor Oxoniensis et super grammaticam" every one will see to be an unscholarly reflection, and a cruel compliment to pay to a university out of Spain.

Let us give Professor Dindorf his due. His experience as one of the editors of the Paris *Stephanus* has certainly enabled him to extirpate a number of solecisms which escaped the watchful eye of Sylburg. His corrections, however, being for the most part of blunders of orthography and accentuation, rarely affect the sense of a passage: difficulties in the sense indeed are constantly ignored. Such a short and easy way of dealing with them has doubtless one advantage, that of securing to an editor immunity from the graver sins of commission. Professor Dindorf has every claim to this negative virtue, but it is at best a poor substitute for the combination of soundness and independence of judgment which is commonly termed competence. We could wish that his usual discretion had not deserted him in certain cases in which he seems to fall into positive error through a misplaced confidence in others. In p. 699 for instance he follows Mullach in perverting τὰ τῆς γνώσεως βάθη into τὰ τῆς γνώσιος βάθεα, as though the words formed part of the Heraclitean fragment which they serve to introduce (!). But as the parallel in Plutarch (*Vit. Coriol.* c. 38) presents no vestige of them, this cheap emendation is already condemned; besides which, an editor of Clement might surely be presumed to know that the expression "depths of knowledge" is Clement's, and occurs elsewhere in Clement. We wonder why Professor Dindorf does not turn τὰ βάθη τῆς θείας γνώσεως in p. 613 into Ionic, if it is only in order to keep Mullach in countenance. Another strange perversion of the text has been adopted ready-made from the old translator Hervetus, or, to speak more charitably, his printer. There is a passage in the *Protrepticus* (p. 5) in which Clement in his fanciful way makes David and Jubal representatives of two types of music, the spiritual and the material. Here Professor Dindorf naïvely takes credit for reading Τουβάλ. We much prefer to think that Clement had a decent acquaintance with the Bible, and knew that Jubal, and not Tubal, is described as the "father of all such as handle the harp and the organ."

With writers of Clement's order, it is their want of originality, their shameless plagiarisms, in short their literary demerits, which render them so precious to the non-theological student. An examination of their "sources," to say nothing of its use to a critical editor, is of the highest general interest, because it helps us to realize the intellectual atmosphere of their age, and reveals, moreover, in many instances valuable remains of a literature now almost entirely lost to the world. Professor Dindorf acknowledges his obligation to point out Clement's debt to older writers, but his treatment of the citations in his author is so strange as to be inexplicable except on one hypothesis, namely, that he had not at starting a sufficient acquaintance with the philosophical literature from which Clement draws so largely. Certainly Aristotle would seem to be almost a sealed book to him. We do not say the same of Plato: Plato's name occurs pretty often in the notes, but, it must be confessed, by no means so often as it might; a characteristic omission is that in p. 654, where the editor fails to detect an extract from the *Republic*, although in the process of transcription Clement has retained the ἔφη and ἦν δ' ἐγώ of the dialogue. Among eccentricities in the way of references we may notice that he assigns a quotation from the *Republic* to the *Alcibiades primus* (vol. iii. p. 84), and would appear from his Index (vol. iii. p. 635) to confuse the Platonic *Timaeus* with the apocryphal work bearing the name of Timaeus Locrus. Careful verification of his references might have saved him from one ludicrous blunder. It will hardly be believed that in p. 732 he corrects the manuscript reading ἀτρεμῆ and ἀσήμαντοι into ἀρτεμῆ and ἀπήμαντοι, through inability to see that Clement is quoting directly from the *Phaedrus*, where the suspected words have been accepted as sound and intelligible by all the commentators from Hermias to Dr. Thompson. Metrical fragments lurking in the text are pointed out as a rule only when Cobet or others have already furnished the hint. The following may give some idea of the editor's procedure when he is left to himself. In editing vol. i. he omits to draw attention to the poetical colouring of the long passage in p. 336, and to the important fact that Clement to all appearance has preserved disjointed portions of, we calculate, at least six or seven lines from some tragedian. We get a ray of light in vol. iv. which comprises the Variorum notes. Heinsius has a discussion on the passage in question, and detects in it *two* lines from some lost drama, a view which Professor Dindorf now perceives to be "not improbable." But why were we not informed of this earlier? What if there are fragments of at least *six or seven* lines to be found? On a point like this the reader of Clement naturally looks for an authoritative decision from one who has been engaged for years on the *Poetae Scenici*.

Here we take leave of Professor Dindorf and his 'Clement.' The new collation of the MSS., besides simplifying the task of the future editor, will doubtless be appreciated by such students as possess the collateral knowledge requisite to turn it to good account. Another valuable feature in these volumes is that they are a répertoire of Cobet's conjectures, and of the learning of the older commentators. We cannot conceal our disappointment at discovering that a veteran Hellenist of Professor Dindorf's eminence has had so very little of his own to impart, and that he so often fails or displays a pitiable helplessness in cases where a duly qualified editor of Clement might almost ensure success. His long connection with the delegates of the Clarendon Press compels us to assume that he has done his utmost for them, but it is impossible to imagine his share in the present work to have been in any sense a labour of love, or one for which he felt any special aptitude. I. Bywater.

A Comparative Grammar of the Anglo-Saxon Language, by Francis A. March. London: Sampson Low, Son, and Marston, 1870.

Professor March tells us in his preface that his work is an expansion of outlines of the general laws of Anglo-Saxon grammar, originally intended for the use of his students at Lafayette College.

> "In preparing this outline for the press, love of the work has led me to fill it up into a Comparative Grammar. Other Comparative Grammars have discussed several languages, each for the illustration of all, and of language in general; this book is an Anglo-Saxon Grammar, and uses forms of other tongues and general laws of language only so far as they illustrate the Anglo-Saxon."

This plan has been fully carried out: the history of the language, the laws of its phonology, inflections, derivation, syntax and prosody, are handled in a way that shows a thorough command, not only of the language itself, but also of its relations with the cognate tongues. In this recognition of the comparative or scientific, as opposed to the purely empirical method of studying Anglo-Saxon which has hitherto prevailed in this country, lies the special value of the work for English readers; it is the first in our language in which the latest results of comparative philology as applied to Anglo-Saxon have been made generally accessible. The advance Mr. March has made on his English predecessors is especially shown in the thorough way in which the phonetic laws are treated, strongly contrasting with their neglect in all other English grammars. Mr. March, we are glad to

see, tacitly rejects the barbarous system of pronouncing the vowels, which still prevails to a great extent among English students; he pronounces, for example, *î* as in *deem*, *û* as in *fool*, and *y* as the French *u*. Some of his views, however, seem to call for discussion. In the first place he repeats the old fallacy of a *necessary* distinction between short and long vowels; thus he pronounces *a* as in *far*, but *â* as in *fall*. It is certainly true that short and long vowels show a tendency to diverge, and that in English scarcely any pairs of them are of exactly the same quality. Thus the vowels of *bit* and *beat* are qualitatively as well as quantitatively different; the long sound of the former and the short of the latter vowel are unknown in English. When this was first noticed, and corresponding shades of distinction were found to exist between most of the other vowel-pairs, it was hastily assumed that quantitative necessarily involved qualitative difference. That the distinctive quality of the vowel in *bit* has nothing to do with its quantity is proved by the fact that it can be prolonged ad libitum, and yet remain quite distinct in sound from the vowel of *beat*. There seems, therefore, to be no reason for assuming any qualitative distinction between the long and short vowels in Anglo-Saxon. Besides, if the Anglo-Saxons had really pronounced their *â* as in *fall*, they would certainly have expressed the sound by its nearest equivalent, the letter *o*, possibly with some diacritic to distinguish it from the original *ô*.

As to the accents of the MSS., it may be mentioned that all that has been hitherto written on them—including, we regret to say, Mr. March's own remarks—is next to useless. It is known that the earlier editors omit the accents entirely, and that German and some English editors insert them on theoretical principles. It is not, however, generally known abroad that most of those editions which profess to follow the MS. usage are utterly untrustworthy. The great majority of texts which have been printed during this century we owe to Benjamin Thorpe, and whatever may be the merits of his editing, accuracy is certainly not one of them. In the case of the accents especially, he does not seem even to have attempted to follow the MSS., accenting apparently sometimes at random, sometimes according to the vague analogies of modern English pronunciation. Mr. March says that *me* and *he* are often accented in the MSS.; but if, as is probable, his examples are drawn exclusively from Thorpe's editions, this argument in favour of their vowels being long is more than doubtful. How far the usage of the MSS. themselves can be depended on is a different question, which can hardly be settled till we have a few reliable texts. It is certain that the authority of the MSS. varies greatly, and in many of them the accents seem to be introduced at random, merely as an ornament. Some of the oldest MSS. make considerable use of doubling the vowels, and it is remarkable that this method of indicating the quantity seems to be employed in all cases with the strictest accuracy.

As another instance of the utter want of system which has prevailed in A.-S. editing, the curious fact may be mentioned that not one of Alfred's works has been edited in the language of his period, although most excellent MSS. exist, written during his life, and probably under his personal superintendence; but from later, and, in many cases, inaccurate copies, in which the characteristic forms are almost entirely lost. When it is considered that the poetry has also been handed down to us chiefly in late MSS., southern copies of Northumbrian originals, which, with the exception of a few scattered fragments, have been destroyed, it is evident that materials for chronological and dialectical investigations, which can only be founded on minute distinctions of spelling and inflexion, are as yet almost entirely wanting. Under these circumstances it is not any fault of Mr. March's that his account of the A.-S. dialects and their successive stages is imperfect. He enumerates the leading features of the Northumbrian dialect, apparently without being aware of the fact that it, as well as the classical West-Saxon, has two distinct periods, an early and a late. A comparison of the proper names in Bede, and the fragment of the original text of Cædmon with the Durham gospels, shows that the language underwent considerable changes in the course of two centuries. Thus, one of the most marked features of the earlier period, the retention of original *ct* for *ht*, disappears in the later writings. He has also omitted to mention the well-marked Kentish dialect, intermediate to the Saxon and Anglian (or Northumbrian) dialects.

There are some points in the declension of the adjectives which are not clearly brought out by Mr. March. The endings in *u* do not occur throughout the whole period of the classic language; on the contrary, they are characteristic features of the earlier period up to the early part of the 10th century. It is not easy to pronounce with certainty on this question, as many of the MSS., which are copies of older originals, exhibit a mixture of early and late forms, but it is tolerably certain that at the time of Elfric these terminations were quite lost, the feminine one being dropped, the neuter changed to *e*, which caused a levelling of the three genders in the nominative, both singular and plural. In the gen. and dat. plur. of the weak adjectival declension there is a remarkable fluctuation between weak and strong, which is not noticed in the grammars. Instead of *-ena* and *-um*, *-ra* and *-an* are often found in the best MSS. of Alfred's time. The latter form is remarkable, as it is against the analogy of the substantive declension.

The Syntax is perhaps the most original and at the same time the most valuable part of Mr. March's work, this being a branch of A.-S. grammar which has as yet been little cultivated by German philologists. It is the only department of A.-S. in which English scholars have done any original work. The present Syntax shows a decided advance on that of Mr. Vernon, the best which has hitherto been written. Some of Mr. March's verbal forms, however, are rather dubious: such a collocation as *hi wæron gewordene numene* reminds us rather of the *ich werde gelobt worden sein* of the German grammars than of any regular A.-S. form. It is true that such a periphrase does sometimes occur, but it is doubtful whether it suggested to the Anglo-Saxons the definite idea of the Latin pluperfect. Even the active perfect and pluperfect are as often expressed by the simple *nam* as by the periphrastic forms. So loose is the usage that the periphrastic pluperfect is sometimes used even for the simple preterite, as in the lines of Beowulf:

> " and hi hine ða begen abroten hæfdon,
> sibæðelingas."

It is doubtful whether *ic eom nimende* ought to be compared with the English *I am taking*. It seems to be merely an occasional and unmeaning extension of the simple *ic nime*. Compare the following passage from Thorpe's edition of *Elfric's Homilies* (I. 505): "þa sona on anginne þæs gefeohtes wæs se munt Garganus bifigende mid ormætre cwacunge," and the translation "*was immediately trembling*." Here the idea of continuity is entirely shut out by the word *sona*. Elfric the grammarian did not attach any very definite sense to these periphrases with *habban* and *wesan*, else he would hardly have translated *amatus sum* by the clumsy *ic wæs fulfremedlice gelufod*. It seems therefore probable that the delicate tense-distinctions of the modern English verb have arisen by differentiation from these originally unmeaning and convertible periphrases.

In conclusion we may be allowed to call attention to a

few isolated cases of inaccuracy, which could easily be corrected in a future edition. What authority is there for *gefôn = gefeohan?* It is certainly not the regular contraction, which is *gefeôn.* All doubtful and sporadic forms should be made verifiable by a reference. The alternation of *h* and *w* in *geseah, gesewen,* is hardly a phonetic change: the Gothic *gasahw, gasaihwans,* speaks rather for the dropping of the *w* in the one form, and of the *h* in the other. The regular A.-S. form of the foreign *Christus* is *Crist,* not *Christ.* These are trifling blemishes, which do not impair the general value of a book which can be unhesitatingly recommended to all English readers who wish to acquire a sound and intelligent knowledge of Anglo-Saxon.

Henry Sweet.

Intelligence.

A series of lectures has been commenced in Palermo by Vigo, Pitrè, and others, for the promotion of the study of the Sicilian dialects, against which the Italian centralizers wage uncompromising war.

The contents of the first three parts of volume vi. of the *Herculanensium voluminum quae supersunt* (Detken, Naples) do not seem likely to add much to our knowledge, as the fragments of Epicurus, &c., are very imperfect: Fasc. i. contains Epicuri περὶ φύσεως, lib. i., xiv., xv., and xxviii.; Fasc. ii., lib. xxviii., et aliorum fragmenta; Fasc. iii., Epicuri περὶ φύσεως, Philodemi περὶ ἐπικούρου, and Colotis πρὸς τὸν Πλάτωνος λυσίαν and πρὸς τὸν Εὐθύδημον.

The new edition of Hesiod by Köchly and Dr. Kinkel (the son of the poet) has appeared. The useful part of the book has been done by the latter, whose critical apparatus is fuller than any yet published. Dr. Kinkel has, for the first time, collated the important Italian (esp. Florentine) and London MSS. The quality of Prof. Köchly's part in the work may be guessed by those acquainted with the Homeric studies.

Prof. Cron has just published an elaborate essay on Plato's *Gorgias;* it is well written, but too bulky (upwards of 200 pages) in proportion to its result.

M. Gaidoz informs us, by balloon post from Paris, that the second number of the *Revue Celtique* which was to have appeared this month, is already in great measure printed off, but will not be published for the present.

The German Universities must suffer terribly from the present war, and in some cases, we believe, all lectures are suspended for the present owing to the absence of students to fill the lecture-rooms. Hardly a single philological work of importance has appeared since June. The editor of the *Philologus* reminds his readers that in 1815 the French forgot to restore sundry manuscripts which they had carried off, the Codex Mutinensis of Theognis, for instance, and the Italus of Thucydides; and that the occupation of Paris by the German armies would be an admirable opportunity for vindicating international morality by returning these stolen treasures to their rightful owners.

THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance.
The Editor of THE ACADEMY *cannot undertake to return communications which are not asked for.*
The next number will be published on Thursday, December 15th, and advertisements should be sent in by the 9th.

General Literature and Art.

Traditions and Hearthside Stories of West Cornwall. By W. Bottrell. Penzance: W. Cornish. London: Trübner.

EVER since the brothers Grimm published the German popular stories of the Rhineland (under the title of *Kinder- und Hausmärchen*), nursery tales and popular fiction of all ages have been looked on in a new light. It was soon seen that much of early mythology was embodied in them. The "Sleeping Beauty," for instance, can be traced back to the early myth which symbolises spring being awakened by the sun's touch, doing away the sleep of winter. The process by which a myth became a romance can in many instances be investigated. Wayland Smith, the Vulcan of the North, has been degraded into a travelling tinker in Sir Walter Scott's *Kenilworth*. The red oxen of the sun, that is the clouds round the setting sun, who are carried away by the dark Power of the West, and again rescued from him by the returning Lord of Light, have become in Livy real oxen whom Cacus carried away from Hercules, and the local guides in Rome showed the cave of Cacus with undoubting faith—had not Evander shown it to Æneas when they took that memorable morning walk up the Tiber side so many ages ago? It became therefore a very interesting pursuit to collect these stories in as many distinct localities as possible, and this led to another striking discovery. It was soon found that tales collected in Hindostan or in Ireland, in Scandinavia or in Southern Europe, were in many cases identical. Not only was the Indo-European race proved to be One by comparative philology, but the same conclusion was arrived at by a comparison of popular fables (the proper name of the science has not yet been invented). Of late, however, as the investigation has extended, this conclusion has become uncertain; for some of the popular tales are found to be widely spread among other races not belonging to the Indo-European stock. Thus in Steere's *Swahili Tales, as told by natives of Zanzibar* (just published), we find the story which tells how "the ox began to drink the water, and the water began to put out the fire," &c., in a way not unlike the nursery story we can all remember (see a notice of this book in the Göttingen *Gelehrte Anzeigen*, 19th Oct. 1870). Have such stories been borrowed, or do they date from a still earlier age, and point to a still higher unity of races? The question is not yet settled, and much previous sifting of the evidence will be required. Baring Gould has further tried to show what in most of these stories is the original element, the "myth-radical," which is at the root of all the various forms that poetic imagination can give to the tradition. The Celtic races have done their share of the work; Campbell has collected the tales of the West Highlands; Carleton and others those of Ireland; Britanny has not been neglected, it remained to gather together whatever of the kind might survive in the West of England. Robert Hunt in 1865 published the *Popular Romances of the West of England*, and Mr. Bottrell (who contributed part of Hunt's materials) has here taken as his province the extreme west of Cornwall. We are somewhat surprised to find how little of the purely Celtic element can be found in these two collections, the existing traditions should in most cases perhaps be considered Anglo-Saxon. It is true that the Celtic saints of the Middle Ages play a part in them, and this naturally, for while Irish saints evangelised the extreme west, north-east Cornwall was closely connected with the Welsh Church, and the southern coast with that of Brittany. But these legends of saints are not what we are looking for. Again there are many stories of giants, and that veracious chronicler Geoffry of Monmouth already tells us, writing in Henry I.'s days, how Corinaeus, who gave name to Cornwall, beat the local giant in wrestling. It is to be feared that Corinoran (others read Cormoran), whom Jack the Giant-killer killed on St. Michael's Mount, is no other than Corinaeus, so unfair is tradition, and so often does it invert the parts of the story. But Mr. Bottrell's first story which tells how Tom killed the giant who lived between Marazion and St. Ives, though armed only with his axle-tree and cart-wheel, does but repeat the well-known tale of "Tom Hickathrift," whose tombstone was to be seen at Tylney in Norfolk, with the axle-tree and wheel carved on it—probably a cross, with the upper part inscribed in a circle, a form often found. The reader should refer to the amusing article in the *Quarterly* for January 1819, "Antiquities of Nursery Literature." It is curious to see how legend localises itself here and there. The Celts probably, when flying before the English, took with them the legend of Arthur, and gave it a local habitation in each of their places of refuge. There are excellent reasons for placing King Arthur's court in Scotland, says a modern antiquary, but so there are for placing it in Wales and in Cornwall, and any one travelling in "King Arthur's land" in Brittany had better not express an opinion in favour of any other locality. But although Tintagel has undoubted claims to Arthur, and it is certain that he is yet alive under the form of a raven or perhaps of a chough, yet nothing of him survives in Cornish tradition, and the Cornish antiquaries can only mournfully point to the existing female name "Jenefer" as a reminiscence of Guenevere, just as they quote the not uncommon name Hannibal, to prove that the Phœnicians once traded in the land. But the change of the early Celtic proper names itself shows how much Devonshire and Cornwall were Saxonised after Athelstan's conquest. In the remarkable list of manumissions in the "Bodmin Gospels," dating from the century previous to the Norman Conquest, we find numberless Celtic names, such as Ourdylyc "golden robe," Arganteilin "silver forehead," and men's names like Grifiuth, Modred, Bleidiud, which at once remind us of Welsh; but the famous "Tre Pol Pen" names are mostly of very late date comparatively, being names of places adopted by the leading families. The Celtic language lasted practically to the Reformation, but even then the miracle-plays acted at the monastery of Glasney near Penryn had to be translated into English, and the active mining and fishing population soon lost the old traditions. What remained was chiefly superstitions as to witches, mermaids, fairies, warnings, ghosts; and a glance at Mr. Bottrell's book will show the comparatively modern character of much which it contains. How the Spaniards landed in Elizabeth's reign in Mount's Bay, how the Sallee rovers were a terror to the same coast, the doings of the smugglers, various love stories (one of them has a "spirit ride" like that in Bürger's ballad), these make up the chief part of the book. Many of the stories reflect the wild character of the country; the desolate moors and the lonely hamlets, each in its own sheltered valley opening out to the sea, have their appropriate legends: the miner can

distinguish unearthly sounds, which tell that the lode of metal is near at hand, and the seamen hear voices from the spectre ship summoning the dying wrecker to his doom. The author has inserted too much local topography to be interesting to other than the natives of Penwith, and in fact the stories are arranged as they relate to various localities proceeding from Hayle westward. He gives, however, a very curious account of the semi-professional droll-tellers who were formerly welcomed at all firesides, and feasts, for their recitals of the old ballads and stories of which they knew so many, and of which their audience rarely tired. The variations in the mode of telling the same stories, some of which occur in ballad form, are characteristic; the names and localities are varied to suit the district and the hearers, and perhaps the minstrels who sung the tale of Troy Divine in the halls of the Ionian chieftains did no otherwise. In any case these stories illustrate the social life of our own immediate ancestors in the time when reading had not taken the place of recitation, and public interests were not so absorbing as personal talk and homeside stories.

C. W. Boase.

The Courtly Poets; from Raleigh to Montrose. Edited by J. Hannah, D.C.L., Warden of Trinity College, Glenalmond. London: Bell and Daldy. 1870.

The title of this book describes it accurately. In the words of the editor, "most of these poems are little more than the comparatively idle words of busy men, whose end was not writing, even while they wrote." This common quality gives something like an unity of interest to the verses of men so different as Raleigh, Wotton, Bacon, Sidney, Sandys, Lodge, Dyer, Essex, James I., Montrose. We cannot help regretting that Dr. Hannah did not begin his collection with Surrey, Wyatt, and Sackville, in order that the list might have been even more complete and various. But Raleigh is in fact the central figure of the group. Dr. Hannah tells us that it was his special purpose "to do an act of justice to the memory of Sir Walter Raleigh." He has consequently devoted much time and labour to the sifting and authentication of the verses ascribed to this great man, and has succeeded in presenting for the first time to the English public a really critical edition of his poems. Before the publication of this volume the collections of Raleigh's songs were both defective and redundant. While much spurious matter passed current as his composition, critics like Hallam could reject his authorship of "The Soul's Errand." The rest of the book consists of the poems of Wotton, and a selection from the miscellanies of about a dozen rhymsters of the Jacobean and Caroline period. It must be admitted that a great many of these versifiers are but mediocre; the three sonnets of Sir Philip Sidney, which Dr. Hannah has placed among them, some of the grave melodies of Sandys, Dyer's song "My Mind to me a Kingdom is," and Bacon's weighty meditations on "The World," appear *rari nantes in gurgite vasto* of paltry and affected nothings. The Elizabethan style did not admit of respectable mediocrity. It was either great and forcible, or else petty and conceited. Of the truth of this remark this volume offers ample evidence.

Nothing strikes one more in reading the verses of these courtly poets than their weariness of courts and contempt of human greatness. Something must be allowed for fashion; it was thought proper to prefer the country to the city, a life of innocent obscurity to brilliant fame. But the complaints of Raleigh, Bacon, Wotton, and Dyer, are too profound and solemn to be merely affected. They are worth attention, as the words of men familiar with greatness. Raleigh says:—

> "What is our life? The play of passion.
> Our mirth? The music of derision.
> Our mothers' wombs the tiring-houses be,
> Where we are dressed for life's short comedy."

The sweeter muse of Wotton replies with no less bitterness:—

> "Fame's but a hollow echo; gold, pure clay;
> Honour the darling but of one short day."

Bacon is more comprehensive in despair:—

> "The world's a bubble, and the life of man
> Less than a span;
> In his conception wretched, from the womb,
> So to the tomb."

Over all the poetry of Raleigh there rests a cloud of deep melancholy and solemn meditation. We need not quote from "The Lie," that bitterest invective of a wounded soul, or from "The Pilgrimage," that quaintest allegory of a mind surcharged with grievances and wrongs. Both of these poems are the obvious expression of intense and present passion. It is enough to point to the verses found in Raleigh's Bible, or to the "Poesy to prove Affection is not Love." Allowing for some repetition of the same thought, the latter is a very remarkable poem for the depth of its reflection and the force of its expression. The following lines are not unworthy of Ben Jonson's Muse:—

> "Desire himself runs out of breath,
> And, getting, doth but gain his death:
> Desire nor reason hath nor rest,
> And, blind, doth seldom choose the best:
> Desire attained is not desire,
> But as the cinders of the fire."

The sententious and weighty force of Raleigh is exchanged in Wotton for delicate sentiment and exquisite purity of style. A few of Wotton's poems, especially the well-known verses to the Queen of Bohemia, the lines upon a "Happy Life," and the "Farewell to the Vanities of the World," if that indeed be Wotton's, are unsurpassable for ease and elegance. The following stanza, from a poem of an uncertain author in the style of Wotton, may be quoted for the artless piquancy bordering on quaintness by which it adds new grace to an old thought:—

> "Go! let the diving negro seek
> For gems hid in some forlorn creek;
> We all pearls scorn,
> Save what the dewy morn
> Congeals upon each little spire of grass,
> Which careless shepherds beat down as they pass;
> And gold ne'er here appears,
> Save what the yellow Ceres bears."

With one other quotation, this time from the veritable Wotton, we will close. It is an epitaph on Sir Albert Morton's wife:—

> "He first deceased; she for a little tried
> To live without him, liked it not, and died."

J. A. Symonds.

Premières Poésies, Poëmes Modernes; "Le Passant," "La Grève des Forgerons," "Deux Douleurs." By François Coppée. Paris: Lemerre.

About three years ago M. Coppée published a small volume of verses, dedicated to his "dear master," Leconte de Lisle. These, which are now known as his *Premières Poésies*, were divided into three parts. The first he styled "Le Reliquaire" because it enshrined the "dead dreams" of youth; because he wished to make to all his lost illusions

> "Une chapelle de parfums
> Et de cierges mélancholiques."

Written with flowing pen, in forms as various and as unpedantic as the verse of Victor Hugo, this portion of the volume, while far more restrained in its style than are most of the productions of a man's first youth, did nevertheless lack the simplicity and cultivated directness of expression which the poet has since acquired. The second portion, called "Poëmes Divers," showed capacity to deal with very different subjects—passing at a bound from the quietest and most minute description of a painted window in a church, to the impetuous indignation of a Circassian war-song—but it showed at the same time that no one set of themes had yet seemed to the poet preferable to another, and that thus far M. Coppée was moved by his power to say something, rather than by the wish to say anything in particular very strongly. The third portion, called "Intimités," contained many private reflections of little worth but for the neatness and elegance with which they were expressed—reflections interspersed, however, with lines and passages of singular felicity, and with touches true to nature and to art. Here, for instance, is a picture, as vivid and suggestive as it is accurate, of Paris, seen and heard in summer twilight by a wanderer who has strolled out to the ramparts :—

"Au loin dans la lueur blême du crépuscule,
L'amphithéâtre noir des collines recule,
Et, tout au fond du val profond et solennel,
Paris pousse à mes pieds son soupir éternel.
Le sombre azur du ciel s'épaissit. Je commence
A distinguer des bruits dans ce murmure immense,
Et je puis, écoutant, rêveur et plein d'émoi,
Le vent du soir froissant les herbes près de moi,
Et, parmi le chaos des ombres débordantes,
Le sifflet douloureux des machines stridantes,
Ou l'aboiement d'un chien, ou le cri d'un enfant,
Ou le sanglot d'un orgue au lointain s'étouffant,
Ou le tintement clair d'une tardive enclume,
Voir la nuit qui s'étoile et Paris qui s'allume."

One is struck throughout these "Intimités" by an absence of enthusiasm which is atoned for by their air of tender half-melancholy thoughtfulness. They abound in brooding reverie; and when the poet passes out of that mood into phases of excitement, instead of extolling "the roses and raptures of vice," the cry which he utters is for the healing hand that "quiets and retrieves." And if there is one thing more than another unconsciously taught throughout M. Coppée's writings, it is the happiness of domestic tranquillity; the danger of exceptional struggles and exceptional success. He is penetrated with country sentiment—with the yearning for country simplicity—while acknowledging that he is himself the "pâle enfant du vieux Paris." He speaks in the "Intimités" of the poet's longing for a

"bonheur très-long, très-calme, et très-bourgeois."

In the "Passant," Sylvia, a courtezan of the Italian Renaissance—more splendid, more thoughtful, and more wearied than the "Jenny" of Mr. Rossetti's new great book—advises the strolling musician to flee from the life of city and palace :—

"Et, quand le ciel sera trop noir, allez-vous-en
Chez le vieux châtelain ou le bon paysan;
Et reprenez après votre éternel voyage.
Enfin, si traversant la place d'un village
Par un riant matin de la jeune saison,
Vous voyez, travaillant au seuil de sa maison,
Une humble et pure enfant aux yeux de fiancée,
C'est là qu'il faut borner la route commencée,
Vivez-y les longs jours calmes d'un moissonneur,
Et vous verrez, ami, que c'est là le bonheur."

And the world-worn poet of the "Deux Douleurs," had he but returned to his own country-side, would have found, we are told, "le vrai bonheur, obscur et paysan." This sentiment, changed in form by change of circumstance, is seen again in that perfect idyll "Les Aïeules:" these old women at the age "où l'âme se repose" seeming to care only to sun themselves on the stone seat facing the south, whence they can hear the song of the *laveuses* and see the cattle going down to drink :—

"Leur sourire d'enfant et leur front blanc qui tremble
Rayonnent de bien-être et de candeur; il semble
Qu'elles ne songent plus à leurs chagrins passés,
Qu'elles pardonnent tout, et que c'est bien assez
Pour elles que d'avoir dans leurs vieilles années—
Les peines d'autrefois étant bien terminées,
Et pour donner la joie à leurs quatre-vingts ans—
Le grand soleil, ce vieil ami des paysans."

I have dwelt upon this feature at some length because it characterizes the later poems not less than the earlier ones, and because this idealization of simple things tells of a tone so different from that of the many poets whose joys are hysterical. In this respect what Alfred de Musset was when spiritually at his best, Coppée is always.

The volume entitled *Poëmes Modernes* was a decided advance upon the work that had preceded it. In it M. Coppée produced stronger situations, and developed more fully that power to "tell a truth obliquely," to

"do the thing shall breed the thought,
Nor wrong the thought, missing the mediate word,"

which a great English contemporary has declared to be the glory and good of art. The "Bénédiction" is a sufficient example of vigorous imagination; whilst "L'Angelus" seems to me to share the merit of those works whose moral is an aroma pervading all—not a clumsy "tag" at the story's end.

M. Coppée's next work, *Le Passant*—one of those short poetical comedies which have more pathos than wit—does not need the ability of Mlle. Agar and Mlle. Sarah Bernhardt to bring out the contrast between its two characters. That it is a stage-play at all—which its success at the Odéon proved it to be—says much for the intellectual standard of the French theatre. But it fulfils more completely the requirements of a chamber-poem, abounding in happy thought and literary grace. Neither in *Le Passant* nor in *Deux Douleurs* does M. Coppée give evidence of that power of combination, that facility in the weaving of many threads, which is a condition of all great success in the writing of dramas.

In *Deux Douleurs*, indeed, one is struck by what is almost poverty of incident, and the final agreement of the two suffering women, who are united only by their love for one man who is dead, to meet once more, "demain sur son tombeau," is scarcely better than the anti-climax with which "Enoch Arden" ends :—

"The little port had never seen a costlier funeral."

Yet in this very drama there are touches of noble pathos and exquisite simplicity, which are not excelled even in *La Grève des Forgerons*.

In *La Grève des Forgerons*, M. Coppée is more than usually dramatic; Père Jean, an old man who worked at an iron foundry, telling his own story to the judges, in a way which is thoroughly consistent, impulsive, and vivid. The workmen had agreed to lay their claim for better wages before their master, and Père Jean had been deputed to represent them. Going, he had found the master at dessert, and had put forth gently yet firmly the common grievance while "le patron" was calmly breaking his nutshells and sipping his Bordeaux. The master had said that there would always be a place for Jean; but as for the rest, they must expect no advance. The *forgeron*—though he had an old wife and two grand-children to support—felt bound to

share the fate of his comrades. But when, after long struggles with poverty, those whom he loved were starving, he made up his mind to go back to work, and first went to say so at the wretched *cabaret* where a committee of the men on strike sat permanently. When they heard of his intention, which was mildly, reasonably, and touchingly told, one of them called him a coward; and for this, Jean, burning with indignation, challenged the abusive idler to a rough duel: the time, that moment; the weapons, the heavy hammers of their craft. The insulter was killed; and Jean, who instantly gave himself up to the police, is now arraigned for murder. The true narrative is his best defence, and he gives it, in the poem, little caring for it to save him.

This short work I regard as the most complete and commendable of M. Coppée's many efforts: it encloses within itself such various excellences. The poet was first fortunate in the choice of subject: this one appealing to no class, but to the race: evoking healthy interest in a problem of our time, instead of ministering to morbid tastes and exciting vitiated palates. The story, vigorously conceived, is also adroitly told: three words spoken half-aside and with the utmost naturalness, often sufficing to put the reader *au fait* with the incidents of the tragedy. The simplicity and directness of the style are maintained from beginning to end: no fine thing is said which might not be struck out of the brain of any honest man in moments of touched feeling, genuine regret, and bitterness of wrath. It is the loyal unreflecting *forgeron* who speaks: the Paris poet is forgotten. Nor is there indeed one line here which I for my part would have otherwise.

FREDERICK WEDMORE.

On the Vernon Dante, with other Dissertations. By H. C. Barlow, M.D. London: Williams and Norgate, 1870.

IN this pamphlet Dr. Barlow, who is well known to students of Dante, both in England and abroad, for his diligence in examining the manuscripts and elucidating the text of the *Divine Comedy*, has given us, together with other notices, a complete account of the greatest tribute which England has ever paid to the poet's memory—the great work of Lord Vernon. The first of the three volumes of which that magnificent book is composed, was published in 1858, the same year in which the noble author produced his volume of reproductions of the four first editions of the *Commedia:* the last appeared in 1865. The work is to be found in most of the great public libraries of Europe; but still, from one cause or another, principally, no doubt, in consequence of its having been printed and circulated privately, it is not as well known as it should be. Accordingly Dr. Barlow has done good service in calling attention to it, and giving an account of its contents. We are not certain that he has succeeded in doing this in the best way possible: perhaps a briefer synopsis might in some respects have been more serviceable. As it is, the account is encumbered here and there by discussions of the writer's own views, and we might well have been spared the sketch of Dante's life, and still more the notice of the English mercenaries in Italy, accompanied by a biography of so well known a historical character as Sir John Hawkwood. But at all events almost all the points of considerable interest in the three volumes have been passed in review.

At the risk of appearing to give a summary of a summary, it may be worth while to say a few words about Lord Vernon's work. Though the information it contains is scattered in some measure over the three volumes, yet, roughly speaking, the first is devoted to the text of the *Inferno*, together with a running commentary on it; the second to the documents, notices, and investigations which serve to elucidate the poem; the third, which is called the album, to views, plans, and other illustrations, contributed by first-rate artists, and executed in splendid style. To the formation of this last collection a quarter of a century was devoted; and it may give an idea of the way in which all the arts have been laid under contribution to raise a worthy memorial to the great poet, if we mention that there will be found in one part of this volume an air composed for Lord Vernon by Rossini to accompany the words of part of the story of Francesca, and that the music is given in facsimile from the composer's own writing. In the second volume will be found chronological tables of Dante's period and a historical map of Italy, together with a sketch of its political condition; a minute account of the constitution and topography of Florence; elaborate heraldic illustrations; a genealogical tree of Dante's family; and other illustrative documents, not the least interesting among which are the texts of the three condemnations of the poet. In respect of the first volume, however, some readers will consider Dr. Barlow's praise rather indiscriminating, as he speaks in the highest terms of the running commentary and verbal exposition which accompanies the text of the poem. It is an ungrateful task to criticize even the slightest fault in so great a work, but it cannot fail to be regarded as unsuitable, that while the real difficulties in the sense are not ignored, equal care is devoted to the explanation of the sense of passages and the meanings of words, which present no difficulty except to the unreflecting and the ignorant. Lord Vernon, indeed, tells us in his preface, and no doubt with perfect sincerity, that he designed this part of his work in great measure for inexperienced students, but in doing so he derogated from the dignity of his great design. Much might have been gained, if he had devoted the same pains to the improvement of the text, instead of adopting in the main that of the Paduan edition.

The remainder of Dr. Barlow's volume is taken up with dissertations on the residence of Dante at Verona, and his visit to the great fall of rock in the neighbourhood of Roveredo, called the Slavina di Marco. This remarkable natural phenomenon, which is forcibly described in the twelfth canto of the *Inferno*, forms a conspicuous object to persons entering Italy by the line of the Brenner railway. Dr. Barlow endeavours to prove, that as Guglielmo da Castelbarco, the owner of the castle of Lizzana, which overlooks the ruin, often visited the court of the Scaligers at Verona, he would naturally have met Dante there, and would not improbably have invited him to his residence. It is evident from the poet's description that he had seen the place, and most probably had clambered over it; and, as Dr. Barlow tells us from personal inspection that the most striking view of the scene is obtained from the fragment of the Castle still standing, it is likely enough that he viewed it from thence. The traditions relating to Dante's sojourn at Lizzana, however, are late in date, and weak in authority; and when Dr. Barlow suggests that Castelbarco would naturally desire "to alleviate the hard conditions of his life by the cheering influence of a romantic country," he hardly takes sufficiently into account the intense dislike of the men of that time for mountainous countries, and especially for the neighbourhood of the Alps.

H. F. TOZER.

An Epic of Women, and other Poems. By A. W. E. O'Shaughnessy. London: Hotten. 1870.

The Masque of Shadows, and other Poems. By John Payne. London: Pickering. 1870.

THERE is nothing which ought to be more carefully looked after by contemporary criticism than the poetry which, without being weighty or central enough to give promise of permanence, is yet more than mere verse, having something

really to tell us, and telling it with some real excellence of manner. The major gods of the poetical synod may safely be left to themselves, for posterity to assess their attributes and precedence; but it is the special business of the poetical critic not to let slip without record and comment work that is well done although it is scholar's work, and although master's work is all that posterity will have time to concern itself with.

Mr. Arthur O'Shaughnessy and Mr. John Payne have dedicated to each other two volumes that have certainly a title to be classed as excellent scholar's work in poetry. The work of Mr. O'Shaughnessy is here placed first, as bearing the stronger stamp of individuality, as upon the whole better done, and as less decisively referable to specific school influences than the other appears to be. The influences to which we should be inclined chiefly to refer it are those of a section of the French Romantiques, Baudelaire and Gautier at their head, who set themselves with a conscious purpose of art, and with an immense care for the technical execution, finish, and symmetry of their art, to give expression to remote phases of supersubtle feeling or perverse imagination, to produce fantastic and demoralised spiritual exotics of the finest colour and perfume. Mr. O'Shaughnessy is least successful where he is most closely following these prototypes, *i. e.* in the "Epic of Women," which gives his book its name, and which is not an epic but a set of lyrics. There is finished writing in all of them, and in the "Helen" one admirable page, where unaccustomed regret for Sparta and the old days comes over her—

> "And heavy wafts of perfume that was known,
> E'en from those dark familiar laurel trees
> That hid where love and lover were alone,
> Rolled back upon the heart with sore disease:
>
> And from the early home there came no less
> Than the reproach of each remembered gaze
> Of friends, and want of all the happiness
> They gave her in their simple Spartan ways."

But the cynical tone of the prefatory "Creation," and of most of the poems appended to it—notably of that one which is a version of the Homeric song of Demodokos, and that other which is a version of the "Affaire Clémenceau" of M. Dumas—reads like a somewhat youthful sort of second-hand, and is at any rate in false taste. Our author's best work is in other sections. Of the formal art of poetry he is in many senses quite a master; his metres are not only good, they are his own, and often of an invention most felicitous as well as careful. The little lyric called "Lost Blisses" seems to me moving and faultless. Very far from faultless, but interesting and in places even exquisite, is the longer poem early in the book called "The Lover," in the idea of it fantastic and a little repulsive, yet not impermissible nor without its illuminating strokes of nature. In it the religious love which was a part of the early faith, the yearning passion of the virgin saint towards Christ, is transposed into a key not Christian; and a kindred passion, haunting and uplifting the speaker, is referred by her to no known object of worship, but to the divinity diffused in nature and the life of the springtide, and revealing its presence by nameless spiritual seizures, longings, and exaltations. We cite one passage of unimpeachable power from another poem called "Bisclavaret," which is likely to mystify the reader unless he takes note, from its initial Old-French motto, that Bisclavaret is Breton for the Norman Garwall, and can further remember or divine that Garwall is Werewolf. The speaker, then, is a Werewolf, but even that a Werewolf of the poet's own invention, who with a horde of accursed spirits like himself puts off his humanity at night for a stronger and fiercer half-fiendish nature; and they range (but not, as one gathers, in the common likeness of wolves), over all sorts of unmeasured and unimagined regions:—

> Now over intervening waste
> Of lowland drear and barren wold
> I scour, and ne'er assuage my haste,
> Inflamed with yearnings manifold,
>
> Drinking a distant sound that seems
> To come around me like a flood;
> While all the track of moonlight gleams
> Before me like a track of blood;
>
> And bitter stifling scents are past
> A dying on the night behind,
> And sudden piercing stings are cast
> Against me in the tainted wind.
>
> And lo, afar, the gradual stir,
> And rising of the stray wild leaves;
> The swaying pine and shivering fir,
> And windy sound that moans and heaves
>
> In first fits, till, with utter throes,
> The whole wild forest lolls about;
> And all the fiercer clamour grows,
> And all the moan becomes a shout;
>
> And mountains near and mountains far
> Breathe freely; and the mingled roar
> Is as of floods beneath some star
> Of storms, when shore cries unto shore.
>
> But soon, from every hidden lair
> Beyond the forest tracts, in thick
> Wild coverts, or in deserts bare,
> Behold They come—renewed and quick—
>
> The splendid fearful herds that stray
> By midnight, when tempestuous moons
> Light them to many a shadowy prey,
> And earth beneath the thunder swoons.

This wild poem is illustrated by a wild design, which, like others in the book, is a matter of striking and unquestionable vision, but, also like the rest, scarcely as consonant with human proportions as an artist's visions ought to be.

The source of Mr. Payne's inspiration is to be found, I think, in our own mediævalist school of poetry; the spirit of his work is in much akin to that of the earlier writings of Mr. Rossetti and Mr. Morris. The influences of this poetry, and of the French poetry I have named, have before now been found to work in alliance; and melody and material finish are things characteristic of both alike. Thus it comes that in the four narrative poems which make up Mr. Payne's volume we find diction as guarded, and versification as refined, though by no means so original, as in the lyrical work of Mr. O'Shaughnessy. The poem of Mr. Payne's which has most fire and ring in it, is a ballad called "The Rime of Redemption;" one would be glad if others moved as rapidly; but the writer has exhibited a patience which his readers will hardly imitate, let the workmanship of his descriptions be never so praiseworthy, in traversing the monotonous regions of chivalric and saintly miracle where Squire Ebhardt wins and wearies of his mystic love, and Sir Floris vanquishes the seven deadly sins incarnate, and is admitted to the fellowship of Sir Galahad. In escaping the mediæval, Mr. Payne does not escape the mystical; his "Masque of Shadows" is in its intention a sort of octosyllabic "Alastor," only vaguer and less varied, inasmuch as the hero (or patient) of the vicissitudes which it describes is one dead and disembodied.

SIDNEY COLVIN.

Studies on Chaucer. [*Chaucer: Studien zur Geschichte seiner Entwicklung, und zur Chronologie seiner Schriften.*] Von Bernhard ten Brink. Erster Theil. Münster: Russell, 1870.

THE fact that the critical study of Chaucer has now taken real hold of the minds of English, American, and German scholars may be hailed as a tide-mark of progress in the history of our literature. Among Teutonic scholars, Hertzberg, Ebert, and Kissner have already laid Chaucer students under weighty obligations, and with their names the present volume will associate that of Herr ten Brink, whose contribution to our knowledge on the subject may be reckoned more valuable, because of wider range, than those of his predecessors. These studies really are what the author claims them to be; a supply of material for the history of Chaucer's poetical development, and of data towards fixing the chronology of his works. They deserve notice not only as a compendium of received criticism, but also as an embodiment of results obtained through Herr ten Brink's own patient and conscientious research. The main points of the book are: (1), An exposition of the laws of Chaucer's rhyme as deduced from his works; (2), A careful examination of the latter with reference to the various sources from which their subjects or details were drawn; (3), An analysis

of their connection and chronological sequence. Herr ten Brink divides Chaucer's poetic life into three periods. The first, ranging from 1366 (or earlier) to 1372-3, is that of French influence—the period of the "Romance of the Rose" and the "Book of the Duchess." The "Translation" is not rejected, as it has been by Mr. Bradshaw, on the score of false rhymes and other shortcomings, but treated as a genuine, though immature, production of the youthful poet. The death of John of Gaunt's first wife in 1369 fixes a proximate date for the elegy. Sandras regards this merely as a servile imitation of two French poems; his judgment is reversed by our author, who proves that, although Chaucer might have taken the machinery of his piece from Machault's *Fontaine Amoureuse*, yet that the close relationship between the French and English poems in reality points to their common source in Ovid. The second period, that of Italian influence, commences with the poet's first journey to Italy, in 1373, and closes in 1384. To these years belong the "Life of St. Cecilia," the "Assembly of Fowls," "Palamon and Arcite;" also the translation of *Boethius de Consolatione*, with "Troilus and Cressida," and the "House of Fame" (1384). Herr ten Brink's treatment of the five poems as so many progressive steps in Chaucer's development from the fettered line-for-line translator of the *Roman de la Rose* into the great and liberal poet of the "House of Fame," is equally ingenious and suggestive. In this part of his work he has drawn largely from Kissner, but his original criticisms throw fresh light upon the subject, and will greatly aid in determining where the Dantesque passages are taken first-hand from the "Commedia," and where at second-hand from Boccaccio. Herr ten Brink, with Mr. Latham, attributes the enigmatical name "Lollius" to a misinterpretation of Horace's line—

"Trojani belli scriptorem, maxime *Lolli*."

Tyrwhitt's suggestion, endorsed by Kissner, is that "Lollius" was a whimsical pseudonym for Boccaccio, whose true name never escapes the poet's pen. Now the explanations of both being guess-work, it seems more loyal to base the puzzle on a caprice of genius, a touch of shandyism, so to speak, in Chaucer, than to father a monstrous blunder upon him. With respect to the metre of the "House of Fame," we think that most readers will be inclined to consider that the style and versification of that wonderful poem offer in themselves the best refutation of the critic's condemnation of the octosyllabic measure. Upon Tyrwhitt's hypothesis, that the "Knight's Tale" is a concentrated recast of an early and full translation of the Theseid, an elaborate argument is based for establishing the seven-lined stanza as the first form of the work which included, according to Herr ten Brink, the fragmentary story of "Anelida and Arcite." But highly ingenious as is the whole line of reasoning, his conclusion remains unsupported by any direct proof. And the same difficulty appears to frustrate the attempt to fix assured and correlative dates for "Troilus and Cressida," and the "House of Fame."

The third period of the poet's development—that of full power and complete independence—opens in 1385, and closes in 1400, the year of Chaucer's death. It includes the "Complaint of Mars and Venus," the "Legend of Good Women," the "Astrolabe," "Anelida and Arcite," "Canterbury Tales," and some minor productions. This period is to be treated by the author in the second part of his work, which will also contain an analysis of the laws of Chaucer's metre. The present volume is supplemented by useful notes, and an appendix containing Machault's *Fontaine Amoureuse*, which supplied materials for the "Book of the Duchess," and Froissart's *Bleu Chevalier*, the latter printed from an inedited manuscript. We are glad to learn that an English version of this valuable treatise will be published by the Chaucer Society.

We have now only to add a few words respecting certain works examined and pronounced apocryphal by Herr ten Brink. The prose "Testament of Love" is now rejected by all the best authorities; but we think that until more conclusive evidence can be brought against the following pieces, they cannot be struck off the roll of Chaucer's poems. These are the "Complaint of the Black Knight," "Chaucer's Dream," the "Court of Love," and the "Flower and the Leaf." They are condemned as spurious chiefly because they are neither recorded by name in the prologue to the "Legend of Good Women," nor by Lydgate in his "Fall of Princes," and also because they fail on the application of the proposed touchstone—that of the laws of Chaucer's rhyme. But why should the first objection bar our acceptance of them as forming part of the unenumerated compositions referred to in "Chaucer's Prayer"? And, again, how can Herr ten Brink's test, important in itself, be fairly applied to productions of which we know nothing but as they stand unscrupulously modernised and otherwise manipulated in the early folios? Consequently, only by the failure of such poems on a close and searching comparison with Chaucer's unquestioned work, can their claims be shaken. The "Court of Love" will, we believe, abide this test; its appended stanzas are entirely Chaucerian, not only in their exquisite rhythm and felicitous expression, but even more in that artistic selection and concentration, of which, among the poets of his time, the master alone knew the secret. And the work itself, which reads like a dream of the poet's youth, closes with a set of vivid impersonations, which exhibit, in its early dawn, his matchless power of individual portraiture. Also, the "Flower and the Leaf" will hold its place as a sister poem to the "Prioresses" and "Nun's Tales." The three, taken collectively, form a manual of the more serious thought and feeling current among women of birth and culture in that period. Less robust in form, less changeful and less bright in colouring than his other compositions, these are, in our poet's favourite phrase, "all womanly," through graceful diction, refined taste, and spotless sentiment. And, naturally, the absence of humour and of paraded learning, urged by Herr ten Brink against the best specimen of the group, marks them all. For Chaucer knew that the mixture of incongruous elements must mar their special charm; just as he knew how fitly a meretricious display of second-hand quotations and broad humour would adorn the Tale of the coarse-natured, vulgar-hearted wife of Bath.

GEORGE WARING.

Notes on Literature and Art.

A new charity, the Ventnor Hospital for Consumption, has given occasion for the exhibition of a set of English water-colour paintings of much historical value, at the gallery of the Institute in Pall Mall. The examples lent to the collection are most of them of a solid representative kind; those of David Cox being particularly to be remarked. There are nine Turners, none of the very highest quality; good average works of Copley Fielding, Dewint, and Prout; an exquisite Lewis; many Cattermoles; some Gilberts; and specimens of the latest developments of figure-painting in water-colour, at the hands of Mr. Rossetti and Mr. Burton, of landscape at those of Mr. Boyce, Mr. Hine, and many others. Speaking generally, the student has here a very unusual opportunity of comparing the work done and the reputations gained in this branch of art during the last sixty years.

Mr. C. Hemans' third volume in continuation of his *Christianity and Ancient Art*, and *Christianity and Mediæval Art*, is completed, and will be published in the spring. It will be more generally interesting than the preceding volumes, on account of recent occurrences in Rome.

Folk-lore and the Talmud.—Dr. Perles, an eminent Rabbinical scholar, points out that "many legends and customs, the origin of

which has been assigned to the latter part of the middle age, already occur in the Talmud." Among the instances quoted are the supposed transformation of men into wild beasts; and the notions that the sun rises and sets with a murmuring sound; that no water can be safely drunk from rivers and wells during the transition from one season to another; and that earth marked by footsteps possesses a magical virtue, dangerous to the life of the man who has trodden it.—See Dr. Grätz's *Monatschrift*, Breslau, September and October, 1870.

Some doubts have been expressed as to the existence of Mirza Schaffi, under whose name a well-known collection of Oriental poems has been published by Bodenstedt. We therefore welcome the information supplied by Herr Adolf Bergé, in the *Zeitschrift* of the German Oriental Society, who states that he frequently met Mirza Schaffi in Tiflis, at the end of 1851. He was a highly cultivated man, and died in Nov. 1852. Only he was never known as a poet in his own country, though his friends are in possession of a few unpublished poetical pieces. His fame is confined to Germany, where, however, thanks to his friend Bodenstedt, it promises to endure.

The six subjects for the forthcoming volume of the *Earthly Paradise* are: for December, The Golden Apples (Hercules and the Hesperides), and the Fostering of Aslaug, a northern story from the Saga of Ragnar Lódbrók, and connected with the Völsunga Saga: for January, Bellerophon at Argos (the Story of Sthenobœa), and The Ring given to Venus (from William of Malmesbury): for February, Bellerophon in Lycia (his dealings with the Amazons, Chimaera, &c.), and The Hill of Venus (the old German story of Tannhäuser). A short epilogue, disposing of the Wanderers from Norway, will end the work.

The Heliographic Process.—One effect of the war has been to deprive of the attention due to it, the "heliographic" process, invented and applied in Paris by M. Arnand-Durand for the reproduction of engravings. The nature of this process which, with a fidelity absolutely unapproached, transfers the engraving to a new plate, from which it is reprinted, is as yet undivulged; but its results may be tested by the examples imported at the beginning of the war by the Messrs. Holloway, of Bedford Street. These comprise the first ten only of a projected series of 40 plates, and among them two Marc Antonios, two etchings of Rembrandt, a Ruysdael, a Claude, and others. It appears that the plate employed in the process wears very quickly; the ordinary copies, of which a hundred have been issued, are by comparison fluffy and imperfect; but the thirty proof copies, ten on India paper, ten on old Dutch paper, and ten on vellum, are of respectively increasing excellence, until for the most experienced eye it is literally impossible to discern a difference in crispness and brilliance of line between the original and the copy. M. Edmond Lièvre is the publisher of this last and most successful exploit of art mechanism; the text is supplied by M. Duplessis, keeper of the print department in the Imperial Library.

During the Hungarian War of Independence in 1849, Alexander Petöfi, the greatest Magyar lyric poet, disappeared mysteriously in a skirmish near Schärsburg between the Hungarian and Russian cavalry. After the "restoration of order" a mutilated edition of his poems was published by M. Emich, a bookseller at Pesth, to whom Petöfi had transferred the copyright in his poetical works. It is now intended to bring out a new edition, which will contain the greater part of the poems hitherto excluded on account of their revolutionary tendencies. His most violent effusions, however, vituperating royalty and the Germans in too unmeasured terms, will still be excluded by MM. Jókai and Gregun, to whom is entrusted the work of selection. A critic, favourable to Petöfi, admits that in literary merit the additional poems are for the most part inferior to those already published. Their interest is chiefly biographical, as illustrating the character of the impulsive poet. Petöfi, it may be observed, is the only Magyar poet who has obtained an European reputation.

Mr. Henry Sweet has in preparation, to be published by the Early English Text Society, an edition of King Alfred's translation of Gregory's *De Cura Pastorali*. The text of the two oldest MSS. will be given in full, on opposite pages, with the more important readings of the third-best MS. in brackets, and an English translation at the foot of the page. The original Latin text will be added, together with various appendices containing readings from the numerous late MSS. and notes on the difficulties of the text. The work will be preceded by an introduction, in which the general features of the language of Alfred will be, for the first time, described and distinguished from those of the later period. The amount of new and original matter will be considerable, as this will be first of Alfred's works which has been printed from cotemporary MSS.; and most of the peculiarities of his period which have been preserved in later MSS. have been generally regarded as scribal errors, especially by German editors. The first part of the work will be published at the end of this year.

The latest of Mr. Boxall's purchases on behalf of the nation, hung in the Gallery only two or three days ago, is an admirable example of Cima da Conegliano, of the best colour and preservation. Its subject is the Incredulity of St. Thomas.

New Books.

COURTHOPE, W. J. The Paradise of Birds. Blackwood.
DUPLESSIS, GEORGES. The Wonders of Engraving. Illustrated by 10 reproductions in autotype. Sampson Low and Marston. [A translation, by N. R. E. M., of *Les Merveilles de la Gravure.*]

Theology.

A Grammar of the Idioms of the New Testament. By Dr. G. B. Winer. 7th ed. Enlarged and improved by Dr. G. Lünemann; revised and authorized translation by Prof. Thayer. Andover, U.S.: Draper.
A Treatise on the Grammar of the New Testament Greek. By Dr. G. B. Winer. Translated, with large additions and full indices, by Rev. W. F. Moulton, Wesleyan Theol. College, Richmond. Edinburgh: Clarke.

THE merits of Winer's *New Testament Grammar* are well known, and a thoroughly good translation of the work will prove a most valuable addition to the library of the student. Up to this time a translation which deserved this epithet could hardly be said to exist. Mr. Masson's version, published some ten years ago, was a work of very unequal merit, in some portions so careful as to leave little to be desired, in others so loose and inaccurate as to be worse than useless. To take a couple of instances from a single paragraph at p. 568, Winer states that the arrangement of words is so largely regulated by the laws of logic and rhetoric that there is little scope left for any peculiarity in this respect impressing itself as a habitual characteristic on the style of a writer. The translator makes him say exactly the opposite. In a note Winer states that he is not acquainted with any work thoroughly treating the subject; the translator makes him say that he has not himself devoted thorough attention to it. Winer mentions as an exceptional case the habit of Tzschirner who aimed at a prosaic rhythm, and who could not fail to be recognised by means of it in any of his writings; the translator makes him assert that "Tzschirner, who tried to establish a prosaic rhythmus, has not succeeded in any of his attempts." In the same paragraph the German *also* passes unchanged into English, and Kühner's attempt (*Versuch*) is converted into his "Inquiry."

The great work of Winer has now had the good fortune to be rendered with an exactness more worthy of its importance, and of the unique position which it will probably long retain, in two independent versions, which have appeared almost simultaneously, by Professor Thayer of Andover, U.S., and by Mr. Moulton. Their labours will be duly appreciated only by those who know the difficulties and the irksomeness of their task. The American translation is made from the seventh German edition, edited by Lünemann, who has inserted various alterations from Winer's MS. notes, and has added on his own part the readings of ℵ and some references, neither numerous nor important, to the more recent literature. Professor Thayer describes his book as a "revision" of Mr. Masson's translation, and there are not a few traces of the injurious effect of the limitation thus imposed; but the rendering has been carefully corrected, and in various portions so recast as to make it to a considerable extent a new, and in all respects a better, book.

The work of Mr. Moulton is still more valuable. It is a new translation made from the sixth German edition—the last issued under Winer's own care. The Preface frankly states that the translator was not at liberty to use Lünemann's scanty additions; but he has amply compensated for their absence by the more thorough revision to which he has himself subjected the work—correcting errors, and carefully verifying, readjusting, and rendering uniform the references—and by the numerous and elaborate (at times perhaps too copious) notes with which he has enriched it. The statements of the original are supplemented from other sources, and, wherever it seemed of moment to do so, the views of more recent writers, continental and English, are given. He has thus worked in the more important portions of Buttmann's Grammar, and much of the grammatical matter in Meyer, while frequent references to Donaldson, Jelf, Bishop Ellicott and Dean Alford increase the value of the work to the English student. With a somewhat exaggerated estimate of the illustration to be derived from modern Greek, he has subjoined various references to Mullach and other exponents of the language in its more recent form. It is difficult to speak too highly of the conscientious labour and research which have produced Mr. Moulton's book. It seems hardly worth while to have made some slight omissions at the outset, for, though the passages omitted are of little moment, the integrity of such a work deserves to be respected. Both translators have largely added to the indices, which are much superior to those of the original. The indices of subjects and Greek words seem somewhat fuller in Mr. Moulton's, who has added a separate index of passages from the Old Testament and Apocrypha; the American edition contains a more copious, and apparently exhaustive, index of passages from the New Testament prepared by Mr. Warren of Chicago.

WILLIAM P. DICKSON.

Biblical Studies, by E. H. Plumptre, M.A. London: Strahan and Co.
The Prophecy of the Old Covenant. [*Das Prophetenthum des Alten Bundes.*] By Dr. Küper. Leipzig: Dörffling und Franke.

"THE papers in the present volume," says Mr. Plumptre in his preface, "have for the most part appeared in *Good Words* and the *Sunday Magazine*." They are certainly of a higher type than the nature of those periodicals would have led us to expect, and it is easy to see that they are founded on the results of conscientious inquiry. Everywhere we meet with a genial style and a poetical fancy, and almost everywhere with that moderation of language which befits the student of such a difficult book as the Bible. Sometimes we are surprised by a critical originality, which refreshes even when it fails to convince, but more often by a restless craving for novel biographical details, deduced from an ingenious combination of scattered passages, without regard to their different degrees of historic credibility. It is only charitable to suppose that some of these essays were written at a distance from books; we may thus account for the critical and philological inaccuracies which too often disfigure the volume.

The best of these papers (it is really a distinguished one) is that on "The Prophets of the New Testament," the substance of which was delivered as a sermon before the University of Oxford; the most faulty that on "The Old Age of Isaiah," which, Mr. Plumptre will pardon us for saying, is equally loose in its criticism, and antiquated in its scholarship. For instance, Hephzibah in Isa. lxii. 4 is stated to be an allusion to the wife of Hezekiah! The third of Isaiah was written in the age of Manasseh! Cyrus is still a titular name of the Persian kings, meaning "the Sun," and might therefore have come to the ears of Isaiah in a natural way! Isa. xiv. 4 is still rendered "the golden city," and xli. 2 "the righteous man from the east!" There were no idolaters (in spite of Ezekiel) among the exiles in Babylon, because there were none among the returned exiles in the time of Ezra!

Only a little less open to criticism are the essays on Immanuel, on the Babylonian captivity, and on Stephen the proto-martyr; the first and the third on the score of inaccuracies in stating the views of opponents, the second on points connected with the history of the Hebrew language. It is really astonishing, after M. de Vogüé's conclusive researches, to find Mr. Plumptre maintaining (p. 258) the Babylonian origin of the square characters, not to mention an almost equal heresy in the next sentence. We trust Mr. Plumptre will correct these errors in a future edition, and at the same time omit the comparison, on p. 21, of the Phœnician word Alonim in Plautus with the Hebrew Elyōn "Most High," the first letter of the former word being an Alef, not, as was formerly supposed, an 'Ain.

We may add that the note on p. 45 might be illustrated by a statement, on the authority of M. Oppert, in Lepsius's *Zeitschrift*, May, 1869; and the paper on the earthquake in king Uzziah's days by an essay on the same subject in Grätz's *Monatschrift für Geschichte und Wissenschaft des Judenthums*, June, 1870.

The work of Dr. Küper may be highly recommended. It is a lucid and dispassionate summary of the arguments and conclusions of "orthodox" criticism, though we cannot help adding that its "orthodoxy" is sometimes pushed to an extreme. There is a carefully written appendix to section iii. on the argument in favour of the unity of Isaiah deduced from the parallel passages in Jeremiah, a subject which the author has already handled in a Latin monograph. On the value of this argument opinions will of course be divided. It appears to us to be essentially a secondary one, as an estimate of the relation between two authors is very liable to be biassed by an admiration for genius. There are several almost identical passages in Tertullian and in Minucius Felix; yet Ebert has conclusively proved that the current opinion in favour of the originality of Tertullian is unfounded. We believe this is the first time that this striking parallel has been adverted to.

T. K. CHEYNE.

RECENT WORKS ON THE NEW TESTAMENT.

AMONG recent works on the New Testament, an English reviewer is bound to give a prominent place to the two new translations of Winer's New Testament Grammar. Our estimate of these works, however, has appeared in another column; we therefore pass on to some other publications, too brief or too incomplete to receive a longer notice at present. And first, to two papers of great interest, by Dr. Lightfoot and Mr. Hort, on the questions arising out of the multiform conclusion of the Epistle to the Romans—in the two last numbers of the *Journal of Philology*. In the first paper Dr. Lightfoot, after stating the facts and reviewing previous theories, examines the view of M. Renan, that the Epistle was a circular letter, copies of which, with different endings, were sent to different churches, and that a later editor put these endings together so as to form the common text. With singular clearness and acumen he disposes of M. Renan's objections to the integrity of the letter, and shews that his theory of its composite character is at once unnecessary and inadequate. Dr. Lightfoot then broaches a hypothesis of his own equally simple and ingenious. He supposes that the Epistle was addressed, substantially in its present form (omitting the benediction xvi. 24, which should be excluded from the text as a mere transposition from xvi. 20, and the doxology xvi. 25-27), as a letter of conciliation to the mixed Church of Rome, and that the Apostle afterwards issued an abridged form of it for more general circulation, consisting of the first fourteen chapters, with the substitution of τοῖς οὖσιν ἐν ἀγάπῃ Θεοῦ for τοῖς οὖσιν ἐν Ῥώμῃ ἀγαπητοῖς Θεοῦ in i. 5, the omission of ἐν Ῥώμῃ in i. 17, and the addition of the doxology xvi. 25-27. The theory is a plausible one, taking account of the facts, and seeming sufficient to explain them. But in the following number Mr. Hort subjects the whole facts, real or alleged, to a renewed investigation and searching criticism, and shews, that while they admit of adequate explanation from other causes, they are incompatible with the theory of two recensions. The textual evidence is marshalled with great care and handled with much skill; and the phenomena which it presents are accounted for with singular felicity. Several of the notes contribute incidentally

valuable and interesting results of critical research, such as at pp. 67, 68, on the relation between F and G, and at pp. 71, 72, on the selection of Church lessons; and the whole article stimulates the high hopes excited by the recent announcement of a portion of Professor Westcott's and Mr. Hort's long-expected edition of the N. T.

Professor Hausrath, in a very clever pamphlet (*Der Vier-Capitel Brief des Paulus an die Korinther*, Heidelberg), reopens the question as to the relation of the last 4 chapters of the 2nd Epistle to the previous portion. Starting from the admitted difficulty of explaining the marked difference of tone in these latter chapters, and setting aside the ordinary explanations as insufficient, he reviews the various allusions in the two Epistles to the four points of difference between St. Paul and the Corinthians, and maintains that the vehement polemics of chaps. x.-xiii. clearly have reference to an earlier stage of the controversy than the gentle and conciliatory tones of chaps. i.-ix. It has often been thought necessary, for the explanation of certain allusions in the Second Epistle which find little apparent justification in the First, to assume the existence of an intermediate letter now lost. Dr. Hausrath finds this intermediate letter in the chapters in question; and as the opening words, **Αὐτὸς δὲ ἐγὼ Παῦλος παρακαλῶ ὑμᾶς**, appear to mark a transition from something preceding which did not, or at least not exclusively, run in Paul's name, he suggests that these fervid words of the Apostle may have been appended to a letter from the Church at Ephesus, which might be expected to take a special interest in the affairs of the Corinthians from their common connection with Aquila. When the Pauline letters were being collected, the apostolic appendix was detached from the letter of the Church and annexed as a fragment to the end of the Corinthian Epistles. The hypothesis is ingenious and striking, and it furnishes a plausible explanation of the phenomena; but in the absence of all external evidence in its support, it can hardly be reckoned as anything more than an interesting speculation.

Ewald has lately issued, by way of appendix to his work on the Pauline Epistles, a similar translation and explanation of the *Sendschreiben an die Hebräer und Jakobos' Rundschreiben* (Göttingen), which he promises to follow up with the remaining epistles. A characteristic preface proclaims, as usual, his arrogant contempt for the Kliefoths and Hengstenbergs, as well as for the admirers of the Tübingen school, Volkmar, and other "windbags." He censures the "bulk" of modern expositors for their besetting sin of filling their volumes with comments on the errors of their predecessors, and declares that he has no desire to write either a big book or a dull one. As might be expected, *his* book is brief, pithy, independent and oracular. As to the origin and destination of the Epistle of James, he is content to refer to vol. vi. of his *Gesch. des Volkes Israel;* but he discusses more fully the questions as to the Epistle "to the Hebrews." It is, in Ewald's view, a homily addressed by one of the younger disciples of St. Paul, after the latter's death and before the outbreak of the Jewish war, to some Church in Italy which had frequent intercourse with Palestine (not Rome, perhaps Ravenna). It was written to counteract the zealous efforts which in that troublous time the Essene or "Christ" party (see *Gesch. Isr.* vi. 505) put forth to induce a rejection of the teaching of St. Paul, and at least a partial return to the old religion as a means of safety. The writer is deeply imbued with the Alexandrian culture represented by Philo, and with the doctrine of the Logos; he is a Christian Philo, in whom Philo and Paul meet. The Philonian character of the work as contrasted with the letters of St. Paul, is visible in its general tenor, in its proofs so constantly based on the Old Testament, in its artificial allegorising interpretation, in its fondness for round numbers, in its artistic rhetorical structure, and smooth and polished Greek style. Ewald makes no attempt to determine its authorship more exactly. The writer (who was well known to those whom he addressed) was led by the circumstances in which he wrote to abstain from giving any definite key to himself or to his readers; possibly he perished early, and, if so, there is the less reason for wonder that his name and authorship should have been early forgotten. But the value of the work was speedily recognised, especially in Rome and the Western Church; it is largely used by Clement of Rome; it was, there is reason to think, already in his time attached for its better preservation to the collection of the Pauline Epistles, but it was not on that account reckoned Paul's, as is plain from its being usually placed at the end of the list. When the knowledge of the original recipients had passed away, it was not unnaturally entitled "to the Hebrews" or Jew-Christians, on whom its arguments seemed specially to bear. A note at p. 30 contains a curious conjecture, "There is no necessity, from the book of Acts, to expect much good afterwards of Apollos; and it is not improbable that he is ultimately to be identified with Apollonius of Tyana." The running comment which carefully traces (or at times invents?) the somewhat artificial links of transition, is full of freshness and vigour.

Dr. Vaughan has, after an interval of ten years, revised and much enlarged his *Epistle to the Romans with Notes* (Macmillan). This work resembles that of Ewald in abstaining almost wholly from reference to the views of others. It is the result of independent study, which has aimed at tracing the meaning chiefly by the light of parallel expressions in the Apostle's other letters or elsewhere in Scripture. In the new edition these illustrations are greatly extended; and the conclusions arrived at, though in substance the same, are expressed sometimes with greater fulness, sometimes with more precision. The book—obviously in its patient elaboration a work of love—is admirably adapted, as it was specially intended, for the use of the upper classes in schools, and of laymen who are repelled from the ordinary commentaries by their array of conflicting opinions and their polemic tone.

It must suffice simply to note the progress of Tischendorf's eighth edition, which, in its 7th part, has now finished the Acts and entered on the Catholic Epistles. We regret to learn that the completion of the great work of Dr. Tregelles is unhappily delayed by the state of his health. The *Bibel-Lexikon* of Schenkel, which is especially valuable as exhibiting in a definite form the views of the more "advanced" school of German theology, has now reached the letter J. Among the more important articles in the recent Nos. are those on Hermas by Lipsius, on Herod and the Herodian family by Keim, on the Epistle of James by Holtzmann, and an elaborate one still unfinished on Jerusalem.

WILLIAM P. DICKSON.

Intelligence.

It will be fresh in the recollection of our readers that the University of Oxford has instituted an honour-examination for the encouragement of Theology. Without any disrespect to that learned body, we may venture to inquire how far that desirable object is likely to be attained. A provisional answer is furnished by the published examination-papers; we fear it will only be satisfactory to those who are indifferent to all sorts or kinds of theology. Opinions may differ as to the merits of the text-books prescribed, or as to the wisdom of prescribing any text-books at all, but no reader can fail to be struck by the absence of all questions tending to excite a spirit of inquiry in the student. The examination-papers, which err by their excessive length, are for the most part mere analyses of the text-books, or where, as in the case of the purely Biblical subjects, no text-book is prescribed, unobjectionable questions relating to facts are intermixed with leading questions involving a definite set of theological, *i.e.* Anglican, opinions. The only exception is the paper on Hebrew grammar, which is scarcely up to the standard of the Little-go grammar-paper in Latin and Greek. We hope that the standard will be gradually raised to such a point as to promote something like a serious study of the sacred text.

The Council of the University of Cambridge has elected our valued contributor, the Rev. B. F. Westcott, D.D., to the Regius Professorship of Divinity.

The Rev. James Martineau is about to publish a new volume of sermons.

Contents of Journals and Selected Articles.

Zeitschrift für wissenschaftliche Theologie, vol. xiv. No. 1.—On the form and contents of the religious idea, by A. E. Biedermann. [A recognition of the distinguished merits of Pfleiderer's work on the philosophy of religion, and a discussion of the points on which the reviewer (author of the 'Christliche Dogmatik') differs from him. We hope to return to this article.]—The Jewish Sibyls and Essenism, by A. Hilgenfeld. [An expansion, with considerable additions, of the writer's article in the *Academy*, pp. 126, 7. The section on the Essenes is devoted to a criticism of recent attempts to prove the purely Jewish character of Essenian doctrine.]—The Leptogenesis (or Book of Jubilees), and the Latin fragment of it found at Milan, by H. Rönsch. [Partly philological, partly critical. Shews that the Milan fragment is translated from the Greek, not from the Hebrew; and that the Book of Jubilees exercised considerable influence on the Samaritans, as appears from the Samaritan Chronicle published last year by M. Neubauer. Dr. R. promises a new work on the subject.]—Paul and the Corinthian dissensions, by A. Hilgenfeld. [A criticism of the recent works of Klöpper and Hausrath. The "Christ-party" = the immediate followers of Christ, who were the prime movers in the Corinthian troubles. Hence the abruptness with which 2 Cor. x. begins. After making up the quarrel with the church, the apostle turns to its guilty authors.]—The Acts of Alexander of Rome, and the festival of the "vincula Petri," by R. A. Lipsius. [On some obscure points in the traditional history of the Roman bishops.]—REVIEWS: Ehrt on Maccabean Psalms, by A. H. [Unfavourable.]—Tischendorf's 6th edition of the New Test., by Egli. [Severe.]—Sevin on the Chronology of the Synoptics.—Sepp on the Gospel of the Hebrews.—Overbeck on the Acts. [Favourable.]—Hitzig on the Pauline Epistles. [Remarkable, as the testimony of an Old Testament scholar to the scientific value of the Tübingen criticism.]—Ewald on the Epistles to the Hebrews and of James. [Unimportant. The last-named reviews are by A. H.]

Geiger's Jüdische Zeitschrift, 1870, Nos. 2 and 3.—Chief Biblical articles: The Repetition in Gen. xxiv. [Defends the view that verses 35-48 were added by a later editor, and points out that the older Midrash in Bereshith-rabba illustrates every verse in the chapter *except*

these. The later Agadah, on the other hand, is profuse in its comments].—The Targum on Chronicles, by Rosenberg and Kohler. [Important for the history of Biblical criticism and exegesis.]—More about the Epistle to the Hebrews. [Apparently by the editor. The conclusion arrived at is that the Epistle was written by a priest, probably of the Sadducean party, and probably after the destruction of the Temple. Heb. v. 11, 27, x. 11, are explained by the Talmudic exposition of Levit. vi. 13. Comp. *Jüd. Zeitsch.* vol. vii. p. 121, &c.]—Renan's Saint Paul. [Appreciative; denies the existence of a definite Pauline system of doctrine.]—An ancient corruption in the text of Nehem. v. 11. [Reads וּמֵאַת הַכֶּסֶף (cf. v. 7) for וּמְאַת הַכֶּסֶף; a self-evident but original conjecture.]

Theologische Studien und Kritiken, 1870, No. 1.—Researches connected with the life of Luther, by Köstlin.—Wieseler's Beiträge, rev. by Düsterdieck. [The remaining articles call for no special mention.]

Stray Thoughts on Comparative Mythology, by E. A. Freeman. [Criticism of Mr. Cox's book from a scholar's point of view. Shows that the method is defective unless the comparison of myths is combined with comparison of languages; and that conclusions which are true for myths of the gods ought not to be extended at once, and without reserve, to similar myths of heroes.]—Fortnightly Review, Nov.

Literarisches Centralblatt, Oct. 29.—Pressensé's History of Dogma. [Brilliant, but one-sided.]—Nov. 5. Overbeck's edition of De Wette on the Acts. [Contains an important modification of Baur's hypothesis, similar to one proposed by Ritschl.]

[SECOND NOTICE.]

WE proceed to indicate certain fallacies which may affect the value of some in the enormous array of their facts; though we would wish to guard ourselves against being suspected of hinting that if some of these facts should be set aside on examination the whole argument must be looked upon as thereby vitiated. And, firstly, a so-called fact may be wholly and even multifariously incorrect, owing simply and solely to literary negligence. A statement of this character was used by Archbishop Whately as an argument, and is given by Mr. Tylor, p. 163, as follows: "The New Zealanders," according to the archbishop, "whom Tasman first discovered in 1642, and who were visited for the second time by Cook, 127 years after, were found by him exactly in the same condition." After this statement we read in Mr. Tylor's words, "*Now Tasman never set foot in New Zealand*, and saw its natives only from and on his ship." It is perhaps more to the purpose to state that the present writer has been informed by a person who now spends his life in Melanesia that some of the accounts which we read in the voyage of the *Astrolabe* of certain islands in Oceania, have just the same and no better basis of fact than Tasman had for writing about New Zealand; and that Whately's example has in its turn also not lacked its imitators, our readers can with very little difficulty and literary comparison convince themselves. Secondly, histories and descriptions may be, and often are, untrustworthy, for the simple reason that they are given by men who, as is often the case, cannot, or, as happily is less commonly the case, will not, give truthful and accurate accounts of what they actually have seen. We speak under this second head simply of narrative statements as to matters of fact, quite irrespectively of errors of interpretation; and for our own accuracy we need only refer to the conventional meaning which is attached to the phrase "Travellers' Tales," and to the force which a reference to Mandeville's labours carries with it. Thirdly, travellers may be purposely deceived by the natives they visit. Herodotus is a stock instance in point; and Labillardière is likely to become another by virtue of the following story, which Sir J. Lubbock tells of him, p. 3, "When Labillardière enquired of the Friendly Islanders the word for 1,000,000, they seem to have thought the question absurd, and gave him one which apparently has no meaning; when he asked for 10,000,000, they said, 'looole,' which I will leave unexplained; for 100,000,000 'laounoua,' that is to say, 'nonsense;' while for the higher numerals they gave him certain coarse expressions, which he has gravely published in his table of numerals." Fourthly, travellers may deceive themselves as to the interpretation and explanation of some well-observed facts, and even in cases where what is observed is kept quite apart, as all good observers do keep it, from what is inferred. It is only a little less difficult to judge of the feelings and views of a savage without being a savage one's self, than it is to judge of the mental processes of one of the lower animals, without being received into its sensorium, and yet escaping identification with it. Swift, if we mistake not, has this source of fallacy before his mind, in putting into Captain Lemuel Gulliver's mouth certain very natural, but as it happens, entirely delusive interpretations of transactions which that navigator witnessed. Fallacies, of course, of interpretation, and fallacies of observation, or simple inspection, are not as distinct in actual practice as they can be made in a work on logic; indeed, as a matter of fact, they are often genetically connected, *chimaera chimaeram parit*, and preconceived prejudices as often spoil observations, as "false facts" give rise to false theories. Again, in recording the performances and processes of savages, as indeed those of any and all living animals, it is of primary importance to secure completeness, and to omit none of the circumstances of the case. The most trustworthy, as well as the least trustworthy, of observers have made their greatest mistakes through shortcomings in the way of filling up the full tale of the conditions; an adequate interpretation presupposes an exhaustive enumeration of facts. If Humboldt had known (see *Tylor*, p. 190) how the entire lifetimes of two Indians may be taken up in a simple and savage process of perforating a hard stone cylinder, the glory and beauty of such a cylinder when worn by the chief on the Amazons or Oronoko, would not have led him to speculate as to the existence in former days of a higher civilization. A savage has as little to do with his time as Sir John Chester is represented as having in *Barnaby Rudge;* and Mr. Wallace has observed and recorded that one of the ways in which that spare time is got rid of on the Rio Negro is by boring out rock-crystal cylinders with sand, water, and a plantain leaf-shoot for a drill. Our

knowledge again of the one fact that much intercourse has in times past taken place between the inhabitants of Australia and those of Malaysia and Polynesia, saves us from interpreting the other fact of the discovery in the former of those localities of polished green jade celts (*Tylor*, p. 203-204), the highest type of the Stone Age weapons, as being evidence of the existence there also of a higher phase of civilization in former days, or as showing that stone implements, even when all precautions are taken, are nevertheless but uncertain indications as to stages of culture. And, to give a third instance, by which in a few words we may enforce the absolute necessity of combining linguistic with other physical science,—if Captain Wilkes had consulted his ethnographer's, Mr. Hale's, vocabularies, he would not have misinterpreted the terror which the Bowditch Islanders shewed when flint and steel were made to produce sparks, and cigars made to produce smoke, before them, into an evidence that these people had no acquaintance with fire, for which they happen to use the same word as many other inhabitants of Oceania (*Tylor*, p. 232-233, ed. 2nd; p. 229-230, ed. 1st.).

Persons who belong to that numerous but ill-informed class who hold that every natural historian must necessarily confine his attention to the material and overlook the moral conditions in any problem which he may enquire into, will not have to read far in either Sir John Lubbock's or in Mr. Tylor's works without being disabused of this prejudice. It is, of course, neither unnatural nor unlikely that any expert should have a tendency to specialism, and on this account it is well to give a particular instance of the way in which a real anthropologist can come safely out of this temptation. Sir John Lubbock (p. 354) gives at some length excellent instances of the fact, now well established, but requiring certain qualifications if it is to be truthfully expressed, that amongst the lower animals reversion to the original type, and so by consequence not rarely to savagery and untameableness, are phenomena often noticeable in mongrels and hybrids. Now no less authorities than Darwin, Livingstone, and Humboldt, have either employed this analogy for the purpose of explaining, or have simply stated that there are, similar facts observable amongst men. Sir John Lubbock, however, does not limit himself to a consideration of the physical side only of our compound nature, but confesses himself inclined to account by reference to the unfortunate (moral and social) circumstances in which half-breeds are generally placed, for the abject or other repulsive characteristics which so often have been attributed to or observed in them. "The half-breeds between the Hudson's Bay Company's servants and the native women being well treated and looked after appear to be a creditable and well-behaved set." Sir John Lubbock cannot surely be acquainted with the *Bericht über die Zusammenkunft einiger Anthropologen in September* 1861, published in that year by Voss at Leipzig, out of which, as we think, the *Archiv für Anthropologie* has developed itself, or he would have referred to the very valuable and closely similar remarks of Von Baer therein contained (p. 18-25) upon this very subject. The Red Indian Chiefs who are elected into the presidency of their tribes by virtue not of descent but of merit, and who must therefore be considered to be picked men,—Von Baer tells us (p 22, l. c.), on the authority of Baron Sacken, an entomologist of some repute,—are in 90 cases out of every hundred mongrels and hybrids between Indian mothers and Anglo-American fur-traders. These male parents are, like the animals they trade in, migratory; neither do they stay themselves nor do they leave white wives in the regions where their bastard progeny is begotten and born. These latter, says V. Baer, remain in the country of their mothers, are not looked upon as inferior beings. and are not corrupted as are other hybrids by being habituated early to a style of living and luxury in a father's house, which, like Ishmael of old, they have sooner or later to exchange for rougher surroundings if not for the wilderness. This positive instance Von Baer has made into a crucial argument by the addition to it of the following interesting history which is drawn from a region much nearer home, and which, while making us acquainted with, makes us also able to account for, the singular fact of the absence of any persistent hybrid race as a result of the constant intercrossing of the German and Esthonian populations in the Russian-Baltic Provinces. The German inhabitants of that part of the world are socially the superiors of the Esthonians; the intercrossing which takes place between the two races is extra-matrimonial, and it is always by the mother's side that the illegitimate offspring is Esthonian. There are no purely physical causes to account for the absence of a distinct hybrid race, the offspring of these unions being ordinarily vigorous, indeed more vigorous than children of German blood on both sides; and Von Baer explains the paradox, as such paradoxes are often to be explained, by a further detail of the facts of the case. These run thus:—The German father does not ordinarily furnish forth his bastard son with sufficient means to enable him to fight the battle of life on equal terms with pure-blooded Germans; whilst at the same time he has endowed him with ambitions, and accustomed him to habits, which make the serf-like life of the pure-blooded Esthonian distasteful to him. Having thus the advantages of neither, and the disadvantages of both races to contend with, these unhappy half-breeds never form a compact mass, but are either absorbed in the town-populations, or swallowed up in the ranks of the Russian army. The somewhat similar history of the mulattos, arising from the intercrossing of Anglo-Americans with negroes, Von Baer explains somewhat similarly (*in loco*, p. 21), speaking of "*der Anglo-Amerikanische Stolz*," words which may be rendered perhaps as "the Anglo-American hardness and pride," whilst the precisely opposite condition of the many varieties of hybrids resulting from the intercrossing of the French and Spanish with negresses and Indian women, with which condition Mr. Bates has made us so well and so amusingly acquainted (see *Naturalist on the Amazons*, vol. i. p. 240), Von Baer explains by what some might call the "greater alacrity in sinking," but what others would call the greater kindliness of the Latin races. "Die letzteren Nationen haben weniger Selbsterhebung" are Von Baer's words.

Sir John Lubbock's views as to the origin of our moral sense (p. 270) are in unison neither with those of Mr. Herbert Spencer, nor with those of the philosophers who hold that it is an originally implanted instinct of the mind. He differs from Mr. Herbert Spencer in holding that it is not experiences of utility to the individual, but public opinion as to certain lines of action being the interest of the many, or at least of some, whilst they are for the moment at least contrary to the interest of some others,—which by dint of repetition established primarily the distinction between that which is advantageous and that which is incumbent. Honesty, he observes, our ancestors must have noticed to be connected with happy consequences to one set of parties in every contract; and respect for old age he instances as being something which the aged would not fail to impress as an injunction upon the young, *praising* those who conformed and *condemning* those who resisted. It is strange indeed that Sir John Lubbock does not see how his method of accounting for the genesis of the notions of right and wrong, like that of all other utilitarians, actually presupposes their existence! How could the old men "praise" or "condemn" except by reference to some pre-existing stan-

dard of right and wrong? how could the parties injured by the violation of a compact "naturally condemn" it except by a tacit or articulate reference to some "naturally" implanted, or at all events to some already existing, standard of virtue and vice? Language which in matters of this kind faithfully reproduces the convictions and feelings, and even to some extent the history of our race, will not lend itself to the support of these theories, and gives the dialecticians for once a real victory over the Natural Historian.

We must also express our surprise that Sir John Lubbock should not have drawn attention to the difficulty which in early stages of our history must have beset the collection of those "experiences of utility," of which Mr. Herbert Spencer speaks as the foundation of our so-called moral intuitions; and secondly, to the exceeding unfitness of the "nervous organization," which Mr. Huxley calls "the thoughtless brains," of a savage—to act as a storehouse for such experiences when obtained. For firstly, the wicked often remain in a state of great prosperity for periods commensurate with the lifetimes of an entire generation of civilized, not to speak of the notoriously shorter-lived savage, men; and a life-long experience would neutralize the results not merely of tradition but of hereditary transmission. And secondly, as Sir John Lubbock himself tells us (p. 70) with reference to the practice of infanticide, the "distinction between the sexes implies an amount of forethought and prudence which the lower races of men do not possess." We commend this estimate of the faculties and capacities of our ancestors to the careful consideration of those philosophers who suppose them to have been capable of processes of stock-taking, which must *ex hypothesi*, have enabled them to anticipate the epigram "Honesty is the best policy."

Whilst Sir John Lubbock has forborne to exhibit this weak point in the argument of utilitarians of Mr. Herbert Spencer's school, we think he has allowed himself to be unduly swayed (pp. 269-274) by the old and weak argument for the non-existence of an intuitive moral sense, which the variations of the moral codes of various nations and tribes furnish. We may press upon Sir John's attention an argument, analogous as we think to those in deference to which he has given us, as he tells us (p. 269), his original opinion,—in every point except in being more obviously fallacious. The writings of Sir John himself (see *Prehistoric Times*, p. 312, ed. 2nd.) and of other archæologists, have made us familiar with the fact that various races have at various times and in various parts of the world buried articles of food and drink, and recently killed domestic animals and slaves with their deceased friends. The inhabitants of prehistoric Aurignac are supposed with some probability to have placed parts of a prehistoric rhinoceros, of a prehistoric bear, and of some other extinct, as well as of some still extant, animals in the grotto which Sir Charles Lyell (*Antiquity of Man*, p. 182) and Sir J. Lubbock (*l. c.*) have both treated of, side by side with their dead; and the inhabitants of Europe are known to have done the like within quite recent times with articles as distinctively historic as spirits and tobacco.

If Mr. Longfellow's account of the burial of a horse with an American-Indian Chief be authentic, the inhabitants of America put to a similar use a gift which they owed in their turn to Columbus. All these practices are referred with all but perfect certainty to the working of one and the same principle—the wish, namely, to send the deceased friend or relative well furnished and fitted out for the new world he was to enter upon; all of them, in a word, presuppose the belief in a future state. Some of these practices would be certain to appear absurd to some tribe or other of mankind, as each and all of them appear to be absurd to us. But from these grotesque variations in the mode of indicating a belief in immortality, we should not be justified in arguing to the non-existence of any such belief at all—and we submit that to argue from the existence of variations in the moral code to the non-existence of any intuitive feeling as to the existence of right or wrong as things to be striven after or avoided, is a process not less illegitimate.

In conclusion, we must say that no writers on the natural history of our species carry so large a load of learning so lightly as Sir John Lubbock and Mr. E. Tylor. We are happy to see a new work announced as forthcoming from the pen of the latter, and we shall rejoice to be able to say the same once more for the former of our authors.

GEORGE ROLLESTON.

The Gulf Stream. [*Der Gulfstrom, und Standpunkt der thermometrischen Kentniss des Nord-Atlantischen Oceans und Landgebiets im Jahre* 1870.] With Charts. By A. Petermann. Geographische Mittheilungen VI. and VII. Gotha: Justus Perthes.

Ocean Currents. Part I., in relation to the distribution of heat over the globe, and Part II. to the physical theory of secular changes of climate. By James Croll, of the Geological Survey of Scotland. Philosophical Magazine, Feb. and Oct. 1870.

FOR five years Dr. Petermann has laboured unweariedly to aid in removing that which he considers a blot in the fame of his country, that as far as scientific expeditions by sea are concerned, Germany remained as backward as Turkey or Greece. His efforts have been so far successful that two German expeditions, both directed towards the fascinating and unknown area which surrounds the North Pole, have already been fitted out; and though these ships have not been able as yet to penetrate further into the icy region than the barriers reached by several of the British navigators, yet they have returned rich in most carefully-conducted scientific observations. In preparing the instructions for those who are about to undertake another campaign in the north, Dr. Petermann has deemed it advisable to investigate thoroughly the subject of the ocean-currents in the North Atlantic in the light of our present knowledge, as bearing upon the choice of a way towards the Pole. The truest indication of the direction and power of an ocean current is given by the temperature of the water which it transports, the curves of the lines of equal warmth or coldness giving the exact form and distribution of the waters of the stream. In following this method Dr. Petermann has collected, it is believed, every recorded observation of the temperature in the North Atlantic, and from these has prepared the admirable treatise which is now before us, which must henceforth be considered as the starting-point of any account of the thermal relations of this area.

Dr. Petermann claims to have been the first to show that the Gulf Stream is a deep, slowly-moving, and permanent warm current from Newfoundland, not only to the coast of France and the parallel of 45° of N. lat., to which limits most of the former hydrographers had confined it, but to the British Isles, Scandinavia, Iceland, towards Greenland, Bear Island, Jan Mayen, and the west coast of Spitzbergen, to Novaia Zemlia and the Polar basin, passing the northmost capes of Siberia as the "Polynia" of Wrangell, its influence being felt even as far as Cape Jukon near Behring Strait. This view he still maintains, supporting it upon the vast number of observations which he has collected. His opinion, however, has not remained unchallenged in the scientific world, and foremost among those who have differed from it is the English hydrographer Findlay, who held, in a paper read before the Geographical Society in February, 1869, that the Gulf Stream proper, in the volume in which it issues from the Florida channel, is insufficient in power to reach

the European coast or to exercise any influence upon its climate; that the Gulf Stream is completely destroyed near Newfoundland by the southward polar stream, and is not traceable further; and that the mild climate of North-Western Europe is due to a general drift of the whole North Atlantic Ocean. To this Petermann replies that the absorption by the Gulf Stream of a drift-current flowing in the same direction is probable, but that at the same time it is indubitable that the Gulf Stream forms the source of the whole movement of the North Atlantic at all seasons of the year. A river on land is said to rise at a certain point and to fall into the sea at another, but by this it is not meant that the little rill of the source supplies the whole of the waters which pour out of its mouth. The Florida stream is like the head of a river which in its way is strengthened by tributaries, and it is impossible to say where the stream really ceases, or where and how many tributaries it receives. Findlay, however, did not deny the existence of a warm stream to Europe, and that remains the most important point, whether it be called a drift-current of the south-westerly winds or a continuation of the Gulf Stream, but Carpenter and Jeffreys, the naturalists of the North Atlantic deep-sea expeditions, do so. Carpenter considers it as still an unsolved question whether the greater heating of the North Atlantic on the west coast of Scotland and Ireland is entirely solar, or to any degree dependent on the extent of the Gulf Stream; and states that if the Gulf Stream reached so far, which is very doubtful, its influence could only extend over a very shallow stratum of the sea-surface, and that only on account of the prevalence of south-west winds. The molluscs of this part of the ocean, says Jeffreys, are for the most part arctic, which fact is against the supposition of the Gulf Stream reaching to the coast of Scotland; but on the other hand the observations made by these gentlemen show that the temperature of the ocean in this region is higher at depths of 1000 and 2000 fathoms than it has been found to be in some parts beneath the equator at corresponding depths. The upper warm stratum of water between Ireland and the Faroe Islands was estimated from the observations taken during both of Carpenter's expeditions at not less than 700 to 800 fathoms in depth, so that if Carpenter and Jeffreys deny the extension of the Gulf Stream to this point, they bring with them the most striking proofs against their own conclusions.

The Hon. Charles Daly, President of the American Geographical and Statistical Society, in his annual address of 1870, quoting the opinion of Mr. Blunt, the American chartographer, spoke of the falsely-represented Gulf Stream, of the inventions of Maury, and the assumptions of meteorologists; stating that the only trustworthy observations which we possess are those made under the direction of Professor Bache; that the Gulf Stream has no existence beyond the Azores, and that its influence on the climate of the British Isles is entirely hypothetical. In Germany the Gulf Stream is better known, as the works of Berghaus and Muhry testify; but there also the extent of its influence has been questioned. These doubts culminate in the "death of the Gulf Stream," in the *Cornhill Magazine* of July, 1869, where a writer says with confidence, "I was truly pleased at reading the other day that the Gulf Stream had been proved to be a delusion. The Gulf Stream was almost as great a nuisance as Macaulay's New Zealander, or the German who evolves things from the depths of his consciousness."

The first portion of Dr. Petermann's work contains the citation of the various sources whence he has drawn the material upon which the charts are based, references to the greater published works, and the actual figures observed at many stations on the coasts of the Atlantic, in light-ships, and in vessels crossing all parts of the sea. These authorities are too numerous even to name; but it may serve to give a notion of the labour connected with such an inquiry if we notice that the eight sheets of the wind and current charts of the North Atlantic drawn up by Lieut. Maury, which have been used, contain no fewer than 27,485 observations of temperature at different parts of the ocean, and at different seasons, whilst the tables compiled by the Royal Meteorological Institute of the Netherlands for this region contain 44,747 separate readings of the thermometer. To show the Gulf Stream completely in all its phases, a chart for each month is necessary, and the conclusions arrived at in this paper have been made from twelve such charts drawn on a large scale; those which accompany the paper are reductions from the two of these which represent the extremes of extension and contraction of the Gulf Stream, in July and January respectively. In the July chart the heart of the Gulf Stream appears as a double tongue of hot water (81° F.), stretching out from the American coast south of Newfoundland, halfway to the Azores; but in January this has shrunk to a narrow single point, reaching no further than the American coast near Philadelphia. Near the Newfoundland coast, where the Gulf Stream first comes into collision with the ice-bearing polar current of Labrador, the isotherms show the cold water like a vast wedge pushed into the stream at right angles to its course. The state of the currents at this meeting-point of the two great streams of the North Atlantic has given rise to the most varied opinions among hydrographic authorities. We have seen that Mr. Findlay believes in the complete annihilation of the Gulf Stream at this point; whilst the Pilot chart of the Atlantic Ocean published by the Admiralty indicates, with apparent precision, that a large part of the Labrador current is deflected by the Gulf Stream into its course to north-eastward, holding the warm stream several hundreds of miles away from the south coast of Greenland. Now, although the observations of temperature in this waste region of the ocean are naturally few, yet a sufficient number have been taken to show that, in the coldest as well as in the hottest month, the Gulf Stream is completely victorious at this point, so as to carry the warm isotherms sharply round the polar current, to northward, towards South Greenland and the entrance of Davis. Again, to the east of Iceland the polar current, interrupted in its course by the barrier of the island, seeks to press into the warm stream, and a third time near Bear Island meeting it from the north-east divides the warmer waters which have reached this latitude in summer into two branches, one of which passes northward still along the west coast of Spitzbergen, the other turning eastward to Novaia Zemlia. The fluctuations of the stream are not less marked in its extreme branches than nearer its fountain-head. In July the isotherm of 59° F. reaches the British Isles, but in January hardly attains the latitude of Spain in the centre of the North Atlantic; and whilst in summer the sea round Iceland and the north coast of Scandinavia is warmer than 50° F., in winter this temperature does not reach beyond the Shetland Islands and the North Sea. Again, in the warm month, water at a temperature of 36° F. is traced on these charts to beyond Spitzbergen on its west coast, and to Novaia Zemlia; but in the cold month this line has contracted to near the North Cape of Norway at its furthest, in the line of the axis of the Gulf Stream.

The course of the Gulf Stream north of Iceland and Europe is more complicated than south of these coasts. After the doubly victorious strife with the polar currents, the waters of the Gulf Stream become more and more cooled to northward, until they are reduced to a tempera-

ture of 39·4° F., at which point they reach their maximum density and weight. At this temperature the Gulf Stream sinks beneath the opposing polar stream; in July this change takes place north of Iceland and Spitzbergen, and on both sides of Bear Island in January, much further to the south. The boundary between the two streams is variously marked; the Gulf Stream water is of a beautiful azure blue so far as it extends, and fin-whales which do not remain in the cold water accompany vessels to its edge; the polar stream on the contrary appears of a dirty-green colour, and is filled with slimy microscopical algæ.

A further portion of this essay examines the evidence of the driftwood of the polar seas in its bearing upon the currents; next the deep-sea temperatures from the time of Scoresby to the present day, with the remarkable sections of the North Atlantic given by the observations of Carpenter and Thomson; lastly, the specific gravity of the sea is discussed, as an excellent aid in the examination of currents.

It is true that there remains much to be done to complete the hydrography of the North Atlantic, but in this admirably thorough work Dr. Petermann has laid a sure foundation of fact upon which future observers may safely build.

There is no longer any shadow of doubt as to the existence of a movement of warm water, be it called a drift or a stream, from the tropics obliquely across the Atlantic Ocean towards the arctic regions. What end and purpose, then, does it serve, and what influence has it upon the condition of the globe? This question is ably answered by Mr. Croll, who, in the opening of a series of papers on Ocean Currents, has been the first to attempt a solution of the problems of the absolute amount of heat or cold conveyed by means of these agents, and the effect of this transference upon climate. His investigations have led to very wonderful results. Selecting the Gulf Stream as the best known, he shows by an apparently reliable chain of evidence that this current alone carries as much heat from the tropics as is received by the globe within sixty-three miles on each side of the equator, an amount which probably equals the entire quantity of heat received by the whole arctic regions from the rays of the sun. Mr. Croll estimates that the stoppage of the Gulf Stream would deprive the Atlantic Ocean of a quantity of warmth equal to one-fourth of all the heat received from the sun by that area; that if all currents ceased to flow, and each place were dependent upon the direct rays of the sun alone for its heat, the equator would be 55° warmer than at present, the poles 83° colder. The mean temperature of the latitude of London would be only 10°. This city then, its present actual mean temperature being 50°, is benefited to the extent of forty degrees of heat by the Gulf Stream.

Basing upon Mr. Croll's estimate of the temperature (10°) of the latitude of London if deprived of the warmth of the Gulf Stream, this seeming paradox must be true, that an ice-bearing current may raise the temperature of a region. Labrador has really a warm friend in the icy current which clings to its shores; for though the mean annual temperature of that country is but 32°, still, according to Mr. Croll's showing, this would be reduced by no less than twenty-two degrees were the polar stream to fail. Though considerable uncertainty necessarily exists regarding the data used yet the general results arrived at of the enormous influence of ocean currents on the climatic conditions of the globe in distributing the heat received from the sun cannot be materially affected, and almost warrant the conclusion come to by Mr. Croll, that without ocean currents the earth would not be habitable.

These discoveries appear to Mr. Croll to throw a new light on the mystery of geological climate. Were the warm currents from the equator northward to be turned off, the northern hemisphere would speedily pass into a state of general glaciation. Such a deflection of the currents, it is believed, might take place by a change in the eccentricity of the earth's orbit. A high condition of eccentricity would tend to produce an accumulation of snow and ice in the hemisphere whose winters occur in aphelion, whilst exactly the opposite effect would take place in the other hemisphere which has its winter in perihelion. Then, since the trade-winds owe their existence mainly to the difference of temperature which exists between the polar and the equatorial regions, it follows that the trade-winds of this colder hemisphere would greatly exceed those of the warmer in strength; and would impel the warmer waters of the tropics entirely over into the opposite hemisphere, in the same manner as the south-east trade-winds of the present state of the globe, from the southern (colder) hemisphere, now overcome the north-eastern; and aid in transferring a larger share of the equatorial waters to the warm currents of the northern hemisphere. A similar condition of things to that which prevailed during the glacial epoch would then exist in the one-half of the earth, whilst a climate equal to that which geologists know to have prevailed in this hemisphere during a part of the Miocene period, when North Greenland enjoyed a climate as mild as that of England at the present day, would reign in the opposite hemisphere.

KEITH JOHNSTON, JUN.

Scientific Notes.

Geology.

A new Siliceous Deep-Sea Sponge.—At the meeting of the Royal Microscopical Society held at King's College on Nov. 9th, Mr. W. Saville Kent, of the British Museum, described and exhibited drawings of a new sponge, for which he proposed the name of *Dorvillia agariciformis*. Its skeleton is siliceous, and while it, in certain respects, agrees in structure with *Pheronema* and other representatives of the Hexactinellidae, in others it is closely allied to the family of the Tethyidae. This, with the forms taken in the "Norna" expedition (and described by him in the *Monthly Microscopical Journal* for this month), makes the fourth new genus of the deep-sea-inhabiting Sex-radiate-spiculed sponges, which Mr. Kent has considered it requisite to create. In the same journal Mr. Kent records having obtained examples of nine out of the fourteen known genera belonging to this interesting group. During his dredging-cruise in company with Mr. Marshall Hall, and from the large amount of material collected, he has found it necessary to slightly modify the scheme of classification hitherto accepted. *Dorvillia agariciformis* was obtained from a depth of 540 fathoms, but the exact locality is at present unknown to the describer.

On the Embryology of King-Crabs.—It is now thirty years since Van der Hoeven made his observations upon the young of *Limulus*, sketches of which will be found in Cuvier's *Règne Animal-Crustacés*. Mr. Woodward pointed out, some years ago, the great interest attaching to this subject, as likely to throw most important light upon the fossil genera allied to the King-crabs. Two very interesting papers have appeared in the *American Naturalist* upon this subject, by the Rev. S. Lockwood and Dr. A. S. Packard, Jr., which shed much light on this old living type of Crustaceans. The eggs are laid in great numbers loose in the sand, and are fertilized by the male after they have been deposited. Passing over the earlier and gradual development of the embryo from the simple yelk, we see in a later stage that the oval body has increased in size; the segments composing the head-shield are indicated; the legs are grown in length, and are doubled upon themselves. The rudiments of the future branchial plates are observable, not coalesced, but budding in pairs. A further advance is signalized by the increase of the head-shield and the development of nine distinct segments, proving that the anterior shield is only the head, and the posterior portion represents the thorax and abdomen, as pointed out by Mr. Woodward from a comparison of the adult living *Limulus* with its fossil allies. It is interesting to observe in the young *Limulus*, in this its penultimate stage before leaving the egg, that the telson is absent, and that the body-segments appear to be free (not anchylosed together), as is clearly the case in several Carboniferous and Silurian forms. In general aspect they recall the Trilobites, *e.g. Trinucleus* and *Agnostus:* the head too has a strong resemblance to the genus *Hemiaspis*, a fossil form of *Limulus* with free body-segments. One other fact re-

corded by Dr. Lockwood is interesting, viz., that some eggs which were believed to be bad, and which were put aside in a dark place, proved to have retained their vitality for nearly twelve months. This tenacity of life in the eggs of *Limulus* no doubt explains the fact of the long geological life of the genus.

Duration of the Cretaceous Epoch.—In *Nature*, No. 52, for Oct. 27th, Dr. Carpenter details at some length the grounds of his assent to Professor Wyville Thomson's statement that "we may be said to be still living in the cretaceous epoch." He says, there can be no question that a formation corresponding with the chalk of the cretaceous epoch, alike in its material, and in the general character of its fauna, is at present going on over a large part of the North Atlantic sea-bed. This similarity is marked, not by the occurrence of a few types of life (like the *Lingulae* and *Terebratalidae* of the older formations), but by the persistence of those which constitute the formation itself, viz., the *Globigerinae*, the Coccoliths, and the Coccospheres; as also of numerous types of Echinodermata that were formerly considered as essentially cretaceous, and of a great variety of those Sponges (including *Xanthidia*) and Foraminifera, whose abundance in the white chalk is one of its most important features. The explorations carried on by Prof. Agassiz under the direction of the United States Coast Survey in the Gulf of Mexico, have furnished results entirely coinciding with those of the *Porcupine* expedition in many of these particulars.

Bathybius.—In a recent pamphlet, analysed in *Nature*, No. 53, for Nov. 3rd, Dr. Gümbel, of Munich, has put forth some further results of his microscopical examination of the deep-sea mud of the Atlantic, in continuation of the researches recorded in the *Academy*, No. 8, p. 208. He first cleared it, by long-continued washing, from all sea-salts soluble in water, and then divided it, by filtering, into three parts. In the first Foraminifera and larger organisms predominated; the second consisted of a sediment easily distinguished from the first, fine but heavy; the third was fine and flaky, remaining lightly suspended in water, and consisting almost exclusively of *Bathybius*, Coccoliths, Coccospheres, together with other organisms of the smallest kind (Diatoms, Radiolaria, Sponge-spicules, and a very few of the smallest Foraminifera). In opposition to the older statement that *Bathybius* thrives only at a depth of 5000 feet, Dr. Gümbel asserts that it occurs in all seas and in all depths. This deprives, he says, these minute bodies of a certain air of mystery with which they were surrounded, as the offspring of the profoundest and most secret depths of the ocean; but by their astonishingly wide distribution and their vast numbers, which stamp them as one of the most essential members of rock-forming substances, they gain infinitely in scientific interest.

An existing Coral of Palæozoic Type.—Mr. W. S. Kent has described a singular species of coral closely allied to the Palæozoic genus *Favosites*, but embodying the structural characters of the two families Positidæ and Favositidæ. He names it *Favositipora Deshayesii*. He has also discovered a fossil coral, belonging to the Palæozoic series, and probably derived from the North American Devonian or carboniferous strata, which forms a second species of the same genus (*F. palæozoica*), and he remarks that the close relationship of these Tabulate corals to the living genus *Alveopora* throws considerable doubt upon Professor Agassiz's hypothesis, that the Tabulate corals are all produced by hydrozoa. (See *Annals and Magazine of Natural History*, Nov. 1870.)

Physiology.

The Structure of the Cornea.—The new volume of the *Arbeiten aus der physiolog. Anstalt zu Leipzig*, 1869, contains some highly interesting observations of Prof. Schweigger-Seidel on the structure of the cornea. By the action of certain reagents on the cornea there are brought into view, under the microscope, a series of irregularly stellate, multiramified, and nucleated bodies, which have been hitherto regarded as essential constituents of the corneal tissue, and are known as "connective-tissue corpuscles." These corpuscles appear under the microscope dark on a light ground, and have received the further appellation of "positive images," to distinguish them from a series of negative images, appearing light on a dark ground, which are observed when the cornea is treated with nitrate of silver, and which were discovered by Recklinghausen. The negative images exactly resemble the positive in form, and are considered by Recklinghausen to be spaces from which the lymphatic canals take their origin. He calls them "Saftkanälchen," and has described other similar ones in the central tendon of the diaphragm. He further considers that the connective-tissue corpuscles lie within the "Saftkanälchen," each process of the former being contained within a corresponding process of the latter. Schweigger-Seidel, who has already combated the reality of the "Saftkanälchen" of the diaphragm, brings forward evidence to prove that the negative images are not spaces but masses of albuminous substance, and that they are identical in nature with, and not external to, the positive images. Further both these images are not due to any structure pre-existing in the cornea, but are artificial products caused by the action of the reagents employed. Since the cornea corpuscles have been made use of by Stricker and others as a means of investigating the changes produced by inflammation, these observations will have a special interest for pathologists.

Schweigger-Seidel believes in the existence of interstitial spaces from which the lymphatics originate, and has succeeded in injecting a series of wide anastomosing canals into the cornea, confirming Bowman's and C. F. Müller's results in this matter. He finds that the deeper side only of these canals is lined with an epithelium. The cells composing this are flat, join one another by broad edges, and closely resemble those lately described by Ranvier as existing in the tendons (*Quarterly Journal of Microscopic Science*, Oct. 1870). A more intimate connection is thus shown to exist between the structure of the cornea and that of ordinary connective tissue.

Under the flat epithelial cells lies a gluey albuminous substance which also extends into the interspaces between the felted fibres of which the mass of the cornea is composed. It is the aggregation of this substance in irregular masses round the nucleus of the superincumbent cell under the influence of reagents, to which the positive and negative images are due. Schweigger-Seidel has further discovered a remarkable geometrical structure in Descemet's membrane, or the posterior elastic layer of the cornea, which is brought into view by the use of a solution of common salt as a reagent.

Physiology of the Pancreatic Secretion.—It is well known that in order to obtain an accurate knowledge of the secretions produced by glands situated in the interior of the body, physiologists have been in the habit of making either temporary or permanent fistulæ—in other words, of dissecting out the duct of the gland under examination, and inserting a small silver pipe furnished with a stop-cock, the external wound being allowed to close and heal up around the pipe. Under these circumstances the secretions may either be allowed to flow continuously or at longer or shorter intervals, and its chemical nature and physiological properties accurately investigated. The great French physiologist, M. Claude Bernard, who made an elaborate series of investigations on the Pancreas and its secretion, employed only temporary fistulæ, maintaining that when the pipe was long retained in the duct it set up irritation, which extended itself to the gland-substance, and led to the secretion of a thin watery matter wholly differing in its qualities from the fluid secreted by the healthy gland which was thick and mucilaginous. In the new vol. of the *Arbeiten aus der physiolog. Anstalt zu Leipzig*, 1869, Dr. Bernstein contributes a paper setting aside, to some extent, the objections raised by M. Bernard. He thinks that after the health of the animal has been restored, the secretion obtained from permanent fistulæ is perfectly natural, and can readily convert starch into sugar, oily substances into an emulsion, and albuminous substances into peptone—the three great duties which it is now very generally acknowledged that the pancreatic fluid has to perform. His experiments have been made on the dog, an animal that is well adapted for treatment, as it has two excretory ducts belonging to the pancreas, into one only of which the pipe is inserted. The general results obtained by Bernstein from his experiments are—(1) That the activity of the gland undergoes variations which stand in direct relation to the ingestion of food, the quantity of the fluid discharged increasing immediately after food has been taken, and attaining its maximum about two or three hours after a full meal. It then diminishes to the 5-7th hour, when it again increases slightly, and finally falls to zero at the 15th hour. (2) That in regard to the influence of the nerves on the secretion, the production of nausea by any means, greatly diminishes the flow of the secretion, whilst vomiting almost entirely arrests it, the effect lasting for a considerable period. He believes that *centripetal irritation of the vagus arrests the flow of the pancreatic secretion:* he was unable to determine, however, whether this action directly affected the cells of the gland, or indirectly through the vessels. (3) That placing the animal under the influence of woorara accelerated the flow of the secretion.

Connection of muscular labour with the elimination of Nitrogen.—We have already (*Acad.* vol. i. p. 184) spoken of the arguments in favour of and against Liebig's view, that the function of nitrogenous articles of food is to produce mechanical labour, that is, motion. This view has been contested by Bischoff and Voit, but a paper that has just been written by Dr. Austin Flint, of New York, furnishes a strong argument in favour of the older view, that in the generation of muscular force the muscular substance itself becomes oxidized. Mr. Weston, a New York gentleman, undertook to walk a hundred miles in twenty-two hours, without preparatory training. Dr. Flint happened to be present during the last three hours, and at once utilized the experiment by carefully examining and analysing the renal secretion eliminated during the walk, which was accomplished without extraordinary fatigue within the time specified. The results of the analysis were some months afterwards compared with analyses of the same secretion obtained whilst Mr. Weston was in perfect health and remained at rest throughout the day. The comparison shewed clearly that the nitrogen discharged on the day of the violent exercise was much more than double of the normal amount, being in fact 142 per cent. more. The phosphates and sulphates also underwent great increase, whilst the chlorides remained almost unchanged.

Botany.

Fertilisation of Compositæ.—Prof. Hildebrand (*Botanische Zeitung*, 1870, No. 30) states that all plants belonging to the very large and important order of Compositæ are protandrous. In order to effect fertilisation, the style increases in length and before the development and expansion of the stigmata, brushes the pollen from the anther-tube by means of the hairs which clothe its surface. It is then carried off by insects to other stigmata which are already developed. Hence the great importance of the subdivision of this order, which has been so much insisted on by all systematists, based on the characters of the stigmata and jointing of the style.

The Fluid of Pitcher Plants.—The liquid contained in the singular pitcher-like leaves of *Nepenthes* and other allied plants has been popularly supposed to be simply a collection of rain-water for the nourishment of the plants during the dry season. In this country, where these plants grow under unnatural conditions, it is very difficult to obtain the genuine secretion free from water, which has become mixed with it in the process of watering. Mr. G. B. Buckton records in *Nature* (No. 54, Nov. 10th) an examination of the constitution of the liquid found in the pitchers of *Coryanthes*, a species of Orchid. He found it clear and somewhat glutinous in consistence, possessing a high refractive power, and a specific gravity of 1·062. It had a pleasant but faint odour, was very mawkish to the taste and unpotable, was neutral to test-papers, and became milky on concentration in the water-bath, yielding finally a transparent gum insoluble in alcohol. Oxalates produced no precipitate of lime, but basic lead acetate gave a curdy precipitate, and hot concentrated sulphuric acid blackened the liquid. Analysis showed that 100 parts of the liquid contained 98·51 of water and volatile oils, 1·49 of nonvolatile residue.

Chemistry.

Avogadro's Law.—Avogadro's hypothesis concerning the constitution of gaseous matter, viz., that equal volumes of different gases contain an equal number of molecules, has within the last twenty years received much confirmation from the researches of chemical investigators. By a freak of the human mind, not uncommon in the history of science, the majority of scientific chemists have been led to take the said hypothesis as a general law. If it were such, its importance could not be overstated. Accordingly, attempts have been made to find other testimony in its favour besides chemical facts. Professor Alexander Naumann, of Giessen, has published in the *Berichte der chemischen Gesellschaft zu Berlin*, ii. 690, a paper which, in his opinion, contains a proof of Avogadro's hypothesis, founded on the principles of the mechanical theory of heat. The *Phil. Mag.* and other influential journals have since reproduced Prof. Naumann's proof. This, and the importance of the subject, induces us to mention a paper just published in the *Berichte der chemischen Gesellschaft zu Berlin*, iii. 820, by Prof. Julius Thomsen, of Copenhagen, which exposes an error in Naumann's proof. Prof. Naumann concludes—"Because arbitrary volumes of gases of different chemical constitution can be mixed without change of temperature, therefore, the vis viva of the molecules of these gases must be the same, viz.: $mc^2 = MC^2$"—whereas he ought to have said $nmc^2 = NMC^2$. Now, by assuming $n = N$, it follows, that as final result of Prof. Naumann's mathematical reasoning, n must come out = N. This equality, however, he undertook to demonstrate.

The Water of the Nile.—O. Popp has furnished an analysis (*Ann. d. Chem. u. Pharm.* clv. 344) of the water of the Nile near the palace of Chonbrah, about six miles from Cairo. The water was found to contain in suspension a comparatively large quantity of clay, organic matter, and ferric oxide. After filtering off this matter, the clear liquid gave on analysis:—

	Grmm.		Grmm.
Carbonic acid	0·03146	Magnesia	0·01467
Sulphuric do.	0·00390	Soda	0·02110
Silicic do.	0·02010	Potash	0·00468
Phosphoric do.	0·00054	Organic matter	0·01720
Chlorine	0·00337		0·14238
Ferric oxide	0·00316		
Lime	0·02220		

In one litre of water.

In consequence of the large amount of organic matter, the water represents a fluid in a constant state of decomposition. In fact, it may be considered as a native liquid manure, and its renowned fertilizing influence on the soil of Egypt thus finds its natural explanation. The inorganic substances are supposed to be chiefly derived from the mechanical action of the water on the primitive rocks at the Cataracts, the organic from the tropical vegetation of the country through which the river takes its course.

On Ccollpa.—In winter, when the rivers on the eastern slopes of the Cordilleras become partly dry, a white efflorescence, called Ccollpa by the natives, is frequently observed on the parts from which the water has receded. Ccollpa collected in the river Rio de Hualfin by Schickendantz, and analysed by him (*Ann. d. Chem. u. Pharm.* clv. 360), was found to consist principally of sodic bicarbonate = $Na_2CO_3+2H_2O$. Another quantity, collected at another time, contained one more molecule of water,—$Na_2CO_3+3H_2O$. The occurrence of this salt under the conditions named is not without considerable interest, in connection with the large deposits of soda salts in some of the southern parts of South America.

On Tollylene-Glycol.—Wurtz discovered in the year 1856 a new class of alcohols, which are known by the name of Glycols. Members of this family have hitherto not been obtained from the so-called aromatic hydrocarbons. Grimaux announces (*Compt. rend.* lxx. 1363) that he has succeeded in preparing from Tollylenic Chloride, $C_8H_8Cl_2$, the corresponding Glycol, $C_8H_8.2HO$, simply by digesting the former with 30 times its weight of water at 170° to 180° C. The Tollylenic Chloride is obtained by the passage of chlorine through Toluol-Dimethyl = C_8H_{10}. Another link is therefore added to the analogies between the fatty and aromatic series.

Physics.

The Spectrum of the Aurora.—Opportunity was fortunately taken of the recent magnificent auroral displays to examine the brightest regions by means of the spectroscope. The results of this examination have been most interesting. In the former observations of Ångström, Wenloch, and others, made with feeble auroræ, the only lines visible have been those in the region which is always brightest with feeble gaseous spectra—namely, the yellow-green. But the light was so vivid at times during the recent displays that lines in the red and blue-green were noticed by several observers. One observer, in a letter to *Nature* (vol. iii. p. 6), records "one strong red line near the C, one strong pale yellow line near the D, one paler near the F, and one still paler beyond." This for the red aurora. The greenish gave the yellow line alone, with traces of continuous spectrum. A proof that the red aurora was due to hydrogen or aqueous vapours, as foreshadowed by these observations, would be a vast step in advance; for its spectrum has been stated to contain iron lines! and on the strength of this the sun's corona has been called a solar aurora!

The Aurora and Earth-Currents.—Mr. Preece, in a letter to *Nature* (vol. iii. p. 15), records an observation of great importance. It has long been known that auroræ are accompanied by "earth-currents," that is, by a rush of electricity through the earth's crust, which seizes upon the easy paths offered by the wires, and produces deflection of the instruments. Mr. Preece has determined that these earth-currents ceased when the auroral display commenced—that they were at their minimum when the displays were at their maximum.

Determination of the Mechanical Equivalent of Heat.—One of the earliest methods employed by Mr. Joule for determining the mechanical equivalent of heat was founded upon the comparison of the quantity of heat evolved in the circuit of a magneto-electric machine with the quantity of mechanical work spent in driving the machine. A new determination of the same important physical constant has been recently made by M. J. Violle (*Comptes rendus*, June 13th), by a method which, in principle, is closely allied to the one we have referred to. M. Violle's process consisted in causing a small thick copper disc to revolve rapidly round an axis perpendicular to its own plane and parallel to the lines of force of a magnetic field of great intensity; and in the measurement, on the one hand, of the amount of work required to maintain the rotation at a known speed for a definite length of time, and, on the other hand, of the quantity of heat produced by the rotation in the copper disc. The result of the experiments gave 435·2 mètre-kilogr. as the mechanical equivalent of one centigrade thermal unit—a value which, considering the number and complexity of the corrections involved in the reduction of the experiments, may be considered as sufficiently near to Joule's number.

Determination of the Ratio of the two Specific Heats of Gases.—If a given quantity of heat be imparted to a given mass of air, the pressure on which remains constant, the air will expand; while if the same quantity of heat be given to an equal mass of air, the volume of which remains constant, the pressure will increase; and in the one case the relative increase of volume, and in the other the relative increase of pressure, will be a measure of the rise of temperature which takes place. Consequently, since the rise of temperature produced by a given quantity of heat is inversely proportional to the specific heat of the body to which it is imparted, the comparison of the expansion of the one portion of air with the increase of pressure in the other will measure the ratio of its specific heat when kept at a constant volume to its specific heat under constant pressure.

An experimental method of measuring this ratio, founded upon the very simple principles that have been indicated, has been put in practice by MM. Jamin and Richard (*Comptes rendus*, Aug 8th), the heat being produced by the passage of an electric current of constant strength through a wire of definite resistance, and the increase of volume or of pressure in the gas surrounding the wire being measured by appropriate methods. The mean of several results gave for the ratio of the specific heat for constant volume to the specific heat for constant pressure, in the

case of air the number 1·41, for carbonic acid 1·29, and for hydrogen 1·41.

A New Method of Calorimetry.—Professor Bunsen has described (*Poggendorff's Annalen*, 1870, No. 9) a calorimetrical method, depending on the melting of ice, which seems greatly to surpass in delicacy any of the methods hitherto employed, and allows of accurate determinations of specific heat being made with at most four grammes of the substance under examination. The process differs essentially from that of Lavoisier and Laplace, in which also the fusion of ice was employed, inasmuch as the quantity of ice melted is ascertained, not from the weight of water produced, but from the diminution of volume which accompanies the conversion of ice into water. The accuracy of the measurements which can be made in this way depends to a great extent upon scrupulous care and exactness in manipulation, and the method would therefore probably be less trustworthy in the hands of ordinary experimenters than in those of one who has gained so well-deserved a reputation for these qualities as Professor Bunsen; but used as he uses it, it is clearly capable of giving very good results. One important application of the process is to the determination of the specific heats of substances which cannot be obtained in quantities sufficiently large to admit of their being examined by the ordinary methods. In illustration of this application, Bunsen has published determinations of the specific heats of metallic calcium, ruthenium, and indium. The specific heat of the last metal he finds to be 0·057, indicating that the atomic weight of indium is 56·7 (or more correctly 113·4), and not 37·8 as has been hitherto assumed; or, in other words, that the yellow oxide of indium is a *sesquioxide* and not a *protoxide*. Bunsen's determinations of the specific heats of silver, zinc, antimony, cadmium, and sulphur, differ on an average by about two per cent. from Regnault's numbers for the same elements, and are all less than his; apparently, however, Bunsen has calculated his results on the assumption that the mean specific heat of water between 0° and 100° C. is 1 instead of 1·005 as found by Regnault, a circumstance which would account for about a quarter of the difference between the two sets of numbers.

Attraction and Repulsion caused by Vibration.—The *Philosophical Magazine* for this month contains a full account by Prof. Guthrie of his experiments on "Approach caused by Vibration," the main results of which were given in vol. i. p. 104 of the *Academy*. The same phenomena have also been examined by K. H. Schellbach, who has arrived at a general result in relation to them which he thus announces in *Poggendorff's Annalen* for last July:—"The sonorous vibrations of an elastic medium urge specifically heavier bodies towards the centre of disturbance, and specifically lighter bodies away from it." This was proved experimentally by means of little balloons of goldbeater's skin, which could be filled with various gases. A balloon filled with air was attracted, while one filled with hydrogen was repelled, by a vibrating tuning-fork, when both were suspended in air; and a balloon filled with a mixture of air and coal-gas, in proportions such as to make it just float in an atmosphere of carbonic acid, was also repelled when surrounded by this gas.

History and Archæology.

The Story of Coriolanus. [Theodor Mommsen's *Kritik der Erzählung von Cn. Marcius Coriolanus.*] By Dr. J. J. Bachofen. Heidelberg: Mohr.

CORIOLANUS, according to Mommsen, is the hero of one of the family legends which grew up with the class of "plebeian nobles" in the Roman Republic. Admitted at length, not merely to the public privileges but also to the social distinction of the older order—initiated, as a Tribune in *Livy* says, to the same mysteries—they are known to have been eager to disown their plebeian birth, and to trace their descent to some fallen star of the patrician race. Of the new houses, as Mommsen points out, the Marcii were among the foremost: C. Marcius Rutilus (Consul, A.U.C. 444) was one of the four plebeians who first had places in the college of the *pontifices*. The plebeian Volumnii and Veturii become noble nearly at the same period. These families, he thinks, had long known the story by which their names have been made immortal, and that not as a mere tradition, but in a finished poetical form, the work of an unknown "Roman Shakespeare." As yet it had no place in the recognised "Annals of the City:" but when a Marcius became one of the body which more than any other influence gave shape to the early Roman history, he was able to get it adopted into the older and, so to speak, patrician body of record. Such are, in a few words, the outlines of the theory which Mommsen has recently proposed in one of those brilliant papers which unite the artistic charm of his larger work to the full statement of evidence and authorities required for the purposes of philology.

Dr. Bachofen begins his examination of this theory by explaining a passage in Dionysius of Halicarnassus which has hitherto been a riddle. At the trial of Coriolanus by the Tribes we are told that nine out of twenty-one voted for his acquittal: "so that," says Dionysius, "if two tribes had gone over to him he would have been acquitted through the equality of votes (διὰ τὴν ἰσοψηφίαν) as the law required." In the case supposed he would have had eleven Tribes (or votes) against ten. What then is this "equality of votes"? Simply the equal value which all votes had within the several tribes, as opposed to the inequality which was the principle of the Servian constitution by Classes and Centuries, Dr. Bachofen shows from the context that this is the meaning of Dionysius: and he then proceeds to turn his discovery against Mommsen's theory, founded, as it partly is, on the supposition that ἰσοψηφία meant an equal division of votes. Unhappily in the exultation of success he is led to write in a strain of triumphant irony through which it is sometimes hard to follow the thread of his reasoning. Mommsen saw in the passage of Dionysius the trace of an earlier version, belonging to a time when there were only twenty local tribes, and he combined this with the other indications first noticed by Niebuhr, of want of harmony between the story and the events amid which it is placed. It remains to ask, how much of Mommsen's theory necessarily falls with the argument from the supposed equal division of votes in the Comitia Tributa. The primitive number of tribes being given up, we are no longer able to claim for the story the distinction of being a poetical fragment of the very earliest times. Enough however remains to bear out the essential part of Mommsen's conclusions. The romantic character of the incidents, the isolation in which the legend appears, the anachronisms and contradictions which it involves, and above all the names and associations on which it turns—all these considerations point to the new and vigorous elements by which, in the fifth century, the Roman governing class was recruited.

Dr. Bachofen makes one curious mistake: he speaks of Marcius and "his three patrician colleagues," in the college of *pontifices*, after the Lex Ogulnia. D. B. MONRO.

Henry VIII. and the "Eastern Question." [*Gabriel Salamancas, Grafen zu Ortenburg, Gesandtschafts-Berichte über seine Sendung nach England im Jahre* 1527.] Mitgetheilt von J. V. Göhlert. Wien: aus der k. k. Hof- und Staats-Druckerei.

AMONGST the historical documents of the Austrian archives lately published, are three ambassadorial reports of the year 1527, of special interest to Englishmen. They are addressed

to King Ferdinand of Hungary, by Count Gabriel Salamanca of Ortenburg, who had been sent on an extraordinary mission to Henry VIII. of England, with the object of inducing that monarch to give his aid against the Turkish invasion.

Scarcely had Ferdinand I. assumed the government of Hungary, after the death of King Lewis in the battle of Mohatsch, when he was attacked, on the one hand by John Zapolya, the woywode of Transylvania, who claimed the crown, and on the other by the Turks, who took Buda, and threatened the German frontier. At this critical period the Emperor Charles V., Ferdinand's brother, was involved in war. Germany had just passed through the great popular movements of the Reformation, and the War of the Peasants; from her, therefore, no help could be expected. In this difficulty, the hard-pressed Ferdinand sent his trustiest councillor for succour to the "Defender of the Faith," in England. It is to this embassy that the reports refer which the Academy of Sciences at Vienna has recently printed in volume xli. of the *Archiv für Kunde österreichischer Geschichtsquellen.*

The quaint letters of the ambassador are a valuable contribution to our knowledge of the character of "bluff King Hal" and the "pompous Cardinal." The Hungarian Embassy was from the beginning destined to come to nothing: a feeling of jealousy against the House of Austria swayed the English monarch to such an extent as to render him unwilling to act in its favour, even against the Mussulman. At the same time, Henry could not lose his reputation as a Christian ruler. The dilemma in which he and his *alter ego* were thus placed, drove them into wily practices of pettifogging dilatoriness which make the perusal of those apparently dry reports "as good as a play."

Count Ortenburg arrived in this country with a royal councillor, Hans von Silberberg, and an *attaché*, Dr. Johann Fabri, who seems to have been the real brain of the mission. In the first interview, after the presentation of the credentials, the Cardinal expresses at considerable length his "sympathy for the sufferings of fellow Christians;" adding, however, that, "since the chief heads of Christendom were engaged in war against each other, it would not be possible for the King of Hungary or anybody else to resist the Turk, unless universal peace ('ain gemainer frid') were first restored among them; in that case, his own king would put forth all his power against the Turk ('wollt sein Kunig all seine macht wider dem Turckhen darstreckhen')." On this establishment of a Universal Christian Peace, the subsequent negotiations hinge; Wolsey's endeavour being, to get up a "London Conference" between the Papal, French, Venetian, Hungarian, and German envoys—a conference in which the German Imperial interest would from the beginning have been in the minority.

This plan, the representative of the brother of Charles V. had no difficulty in seeing through. He met it at once by the remark that he "had no mission to the other embassies, but only to the King of England." Wolsey, nevertheless, recurred to the idea several times, until Count Ortenburg plainly declared that "the *oratores* (envoys) of the Pope, of the King of France, and of Venice, are disagreeable to us." Afterwards we find him and the Hungarian envoy concerting quietly, sometimes humorously, to foil the Cardinal. Thus, when Henry was to receive both envoys on the same day, the Cardinal had intended doing special honour to the one from Hungary, by sending a court chamberlain to meet him. But the Imperial ambassador coming towards them on the way, Count Ortenburg "took the latter in the middle between himself and the chamberlain, keeping for his own part the right-hand side;" and so the three ride together to court, the representative of Charles V. thus getting the lion's share of the honour.

Amidst great pomp, in the presence of lords spiritual and temporal, the envoy of Ferdinand is received by Henry in person, when the credentials are once more presented. There, Dr. Fabri pronounces a set diplomatic lecture of an hour and a half, "the heads of which had been placed in the hands of the Cardinal, at his desire, three days before." The royal reply, drawn up in advance, is then read by a secretary; being the same as that which the Cardinal had given beforehand on his own responsibility. There is an undercurrent of irony in the report Count Ortenburg gives of both this reply and the following diplomatic tournament which he had with the King. Henry had promised his assistance under condition of a general Christian peace, "although England, with her inhabitants, might by nature defend herself very well against the power of the Turk, from whom she was situated rather far away." But during the ensuing discussion, Henry mentions that the woywode, Ferdinand's rival for the Hungarian crown, "had made an offer to France, to the Pope, and to him (Henry) also, that *he* would do great things against the Turk." Count Ortenburg replies that it was Zapolya himself who had brought the Turk into Hungary, and had still secret dealings with him; upon which the King breaks in: "Audiatur et altera pars!" Henry insists that the woywode had been regularly elected King of Hungary; and when the ambassador endeavours to explain the delusive character of that election, Henry, fortified with stock quotations, replies, "Omne regnum in se divisum desolabit!" He also gives the envoy to understand that the pecuniary aid which was asked from him might "the next day be used for sending troops to Italy to drive away a Christian prince"—a hard hit against the Italian policy of Charles V. Here, Count Ortenburg tries to parry the blow by suggesting that Henry might make a draft of subvention-money payable only for the contingency of a new attack by the Turks; whereupon the King says he "would take counsel with his advisers." The ambassador then retires; but Henry retains Dr. Fabri, with whom he enters into a theological discourse about Luther and his adherents.

In a second interview, the long-winded speeches of Wolsey are vague as before. He receives with apparent glee the announcement that Fabri was to be specially despatched to Charles V. to urge pacific measures upon that monarch, and eulogizes Ferdinand for "having shown himself as firm against heretics as he now does against infidels." The talk seemed to grow friendly; and when the ambassador, thinking there was now a chance, pressed his point, Wolsey said, that "rather than leave the King (of Hungary) in the lurch, he himself would get together 300,000 ducats," with which warriors should be enlisted, and he in his own person would take the cross. He also said that "his King was a Defender of the sacred Faith; that he had written against the heretics and ordered others to do the same; that he would do so as long as he lived, preserving his own realm from heresies and rebels; and that it would not become him therefore to refrain from protecting the Christian creed against the Turk." Waxing more and more intimate, the Cardinal treats the ambassador to a long tale as to "how He had risen in life; how He managed the King; how He governed; how his King heard three masses a-day; at what time he heard the sermon, and when he received the sacrament; and how he did not allow any heresy to get the upper hand." The word "*Er*" (He), signifying Wolsey, is here always written with a capital letter, although the German language was very sparing of capital letters at that time. "*Er und sein Khunig*" (He and his King) also occurs in the report.

In the same conversation the Cardinal observed that his

sovereign would "treat *separately* with some of the Prince-Electors" of Germany, that they might give immediate aid to Ferdinand. This endeavour to enter into relations with the German princes, irrespective of the emperor, was as characteristic of Henry as of the French kings, who worked for a disruption of the German Empire.

The conversation with Wolsey had lasted not less than four hours,—"to our joy," as Count Ortenburg writes. Yet, doubts as to the Cardinal's real intentions continually crossed his mind. On Wolsey asking what sort of succour King Ferdinand demanded, the ambassador replied, "that they wished the King of England would pay some 15,000 to 20,000 soldiers as long as the war should last."

From a third report we learn that Henry VIII., after having received the ambassador, led him into another apartment, where the Queen was, when some talk occurred about family matters, and afterwards a formal exposition of the Eastern Question was made to Henry's Queen, in the absence, it seems, of that jealous monarch. The Queen also promises to do her best to make her husband give all possible aid in this Turkish difficulty; but, "as it was already late, and the repast had been placed on the table," the envoy takes leave. Count Ortenburg is then entertained in another room of the palace, where Wolsey presides at table. Among the guests is the Papal Nuncio. The conversation taking a turn somewhat dangerous for the interests represented by the Hungarian ambassador, the latter warns Dr. Fabri not to enter into any dispute, but "rather to start some other subject, viz., the writings of Luther and their interpretation." After dinner, however, the Turk, the woywode, and the 25,000 ducats, are again discussed, until Wolsey is summoned to attend the King.

During the foregoing interview, Henry had been informed that, though a general Christian peace was not yet possible, still, by the exertions of King Ferdinand, a truce for five years had been arranged between Russia and Poland, and that, on the other hand, the Turks were marching forward in force. Henry replied that he could not help His Majesty of Hungary, "inasmuch as he knew well that *Lutheranism had grown so strong, and exercised such seduction upon the mass of the people, that, wherever the Turk appeared, they would rather go over to him and drive away the Emperor, Your Royal Majesty* (King Ferdinand), *and all the Christian princes, than help in beating the Turk.* Now, if that happened, he (Henry) would have to defend himself both against the Turks and the Lutherans." In this manner they continue wrangling about Christian duty, and royal legitimacy, and what really happened at the battle of Mohatsch, &c.; Count Ortenburg entering sometimes with *naïve* earnestness into questions about which Henry evidently did not care in the least. The ambassador then asks that the King should at any rate not send the 25,000 ducats to the rival woywode; and this demand is graciously granted. But bickerings immediately recommence. Still Henry protests that he "dearly loves" Ferdinand, "on account of the brotherhood of the Order of St. George, on account of relationship," on account of Ferdinand having "displayed such valour against the damned heresies of Luther ('wider die verdampten Kezereyen des Luthers');" and he declares that, if a General Peace were established, he would "not only give aid against heretics and infidels, but enter with his whole realm into the contest, that is, with his people and treasure, and risk even his own body and blood."

But for all these promises, the embassy could not get the King to give them even a line to that effect in writing. When pressed for it, Henry said he would "himself send ambassadors, whose message would be the more joyful," if *they* in person brought the good news in writing. Count Ortenburg, nothing daunted, requests the King that he might at least "give *this* reply in writing." Henry calls the Cardinal in. After a confabulation with this experienced man, the reply is, that "the embassy had only brought written credentials, but no written exposition, with them, and that King Henry therefore would also favour them with credentials, and transmit his answer afterwards at some length."

Finally, Wolsey, taking the envoy aside, confides to him the secret of the aversion King Henry feels in the matter; saying, that the King thought it wrong that Ferdinand had "spent money in Italy against the Christians, and then came to ask aid from others against the Turks." He, the Cardinal, however, would, "if his king gave no aid, rather sell his coat from his body than forsake" the King of Hungary. Wolsey then asked about the way of transmitting the money which was to be collected. The envoy, wishing to see the money as soon as possible, proposes to have it transmitted to Malines, from which place it could be further sent on. But the Cardinal thinks it best to transmit it to the English envoy in Hungary, whenever it is sent.

With great thanks, Count Ortenburg thereupon takes leave and goes on board ship at Dover, from which town his last letter is dated, April 7, 1527. I need scarcely say that all the elaborate talk of Henry and Wolsey was simply intended to deceive: and the impression left on the mind by these reports is similar to the one we gather from some pages of *Reynard the Fox*.

KARL BLIND.

Hallamshire: the History and Topography of the Parish of Sheffield. By Joseph Hunter. New edition by the Rev. Alfred Gatty, D.D. London: Virtue. 1869.

THE *History of Hallamshire*, originally written by Joseph Hunter, but republished last year with large and valuable additions by the Rev. Dr. Gatty, Vicar of Ecclesfield, possesses a unity of interest which topographical works can seldom pretend to, whatever be their other merits. This arises from the fact that instead of dealing with a wide area,—it treats of one city, one family, and one industry. It is the picture of the development of the moral and material civilization of the town of Sheffield under the auspices of the lords of Hallamshire. Passing over the dim vestiges of British and Roman occupation, the first well-ascertained fact is, that Earl Waltheof, son of Siward the famous Earl of Northumbria, owned "Hallun" or Hallamshire before the Conquest, and held his "aula" (castle and court of justice) in this manor. So much we learn from Domesday book. At the date of the survey, Roger De Busli held Hallamshire of the Countess Judith, Waltheof's widow; his castle stood at the junction of the Sheaf and Don, in what is now the heart of Sheffield. Before long, but by what steps, of forfeiture, or marriage, or escheat, is unknown, the De Buslis gave place to the De Lovetots, a humane and church-building race. They ended in an heiress, whom Henry II. bestowed on young Gerard de Furnival. These Furnivals ruled in Hallamshire for two hundred years; and the last of them owned a messuage in Old-bourne (Holborn), where now stands Furnival's Inn. They too ended in an heiress, Joan, who married a Nevil; her only child, a daughter, married the famous John Talbot, Earl of Shrewsbury, who fell at Chatillon in 1453. The Talbots built the Manour in Sheffield Park, parts of which are still standing; here Wolsey lodged, on his way to die at Leicester, and here Mary Queen of Scots passed fourteen weary years of captivity. Again there was a failure of male heirs; and, through an Alethea Talbot, Hallamshire passes, early in the 17th century, to the Howards of the ducal house, who hold it still.

The material civilization of Sheffield, depending chiefly

on its industry of sharp-edged tools, is explained by its situation. Five rivers, the Don, the Sheaf, the Porter, the Loxley, and the Rivelin, join their waters at or near the town, and by their frequent rapids supply that abundance of available *power*, which the brooding minds and cunning hands of a capable race, encouraged generally by the lords of the soil, turned effectually to account. Also most things that concur in the manufacture of steel are found within easy reach; Hallamshire itself teems with iron-ore, coal, woods of young oaks for charcoal, the best grit in the world for grindstones; while limestone to any amount is found in the moors just over the Derbyshire border. Sheffield knives, or "whittles," were famous in the time of Edward III.; as we learn from Chaucer in the "Reve's Tale:"—

> "A Scheffeld thwitel bar he in his hose;
> Round was his face, and camois was his nose."

In modern times, the invention of cast-steel in the middle of the last century by Benjamin Huntsman, a Lincolnshire man, has led to a great expansion of the trade of the town. In its most recent aspects, this expansion is ably described by Dr. Gatty, who devotes a special chapter to the purpose.

Here we are told of the honourable history of the firm of Rodgers, whose knives are known all over the world, and whose family have been in the business these two hundred years; of the immense demand for railway-springs, buffers, and all descriptions of railway-iron, which has lately come upon Sheffield, and led to the establishment of a host of new iron-furnaces; of the incorporation of the city in 1843, and the bursting of the great Bradfield reservoir in the Loxley valley in 1864; lastly, our editor, with firm but gentle hand, traces the lamentable story of those "trade outrages," of which a few years ago we heard so much.

T. Arnold.

Saint Anselm. By R. W. Church. Macmillan.

There are some men in the history of the Middle Ages whose lives and characters stand out before us with singular clearness, and in a way remarkably attractive to the historian. S. Anselm and S. Thomas à Becket are obvious instances. The greatness of S. Thomas is evinced by the mass of legend which at once gathered round his name; and the numerous letters of the time, both of friends and enemies, attest the interest felt in the struggle which he maintained, almost single-handed, with the greatest monarch of the age, a struggle which became of European interest, and made the pilgrimage to the shrine of Canterbury so popular among all the nations of the West. But his course is stained with too much of worldly passion and mixed motives to have the charm which attaches to the life of Anselm. The true-hearted, pure-minded man, the man whom the Conqueror most wished to see when on his death-bed, drew strongly to himself the love of those who were the worthiest in that generation. The affectionate biography of him by Eadmer, his friend and companion, contrasts strongly with the biographies of Becket; we seem to breathe in a sweeter and finer atmosphere; and though the sounds of strife were all around, Anselm lived a charmed inner life, less affected by outer troubles than was possible for Becket,—a man whose life had been almost entirely one of the hard outward world. And yet Anselm had to fight out the great question of Church and State, first with the brutal soldier William Rufus, and then with Henry Beauclerk. The quarrel was in both cases inevitable; neither side could give way. The State could not withdraw its claim on the allegiance of the Bishops and Abbots who held large lands, and were really great Barons, capable of raising a civil war, as Stephen had found to his cost. On the other hand, the Church had partly been urged on by events, and partly it had been forward to assume a position towards the State, which had now obtained a theoretically firm basis in the forged Decretals, and which was justified, in the eyes of most men, by the injustice and corruption of the civil power. We may use the prevalence of monasticism in any age almost as a barometer by which to measure the state of civil society. Good men fled to the cloister because a true religious course was impossible in the world of daily life. All the finer and better natures therefore were to be found among the monks; for such as Anselm no other course was possible, and the theory of a theocracy which should cause justice and right to prevail on the earth had irresistible charms. The discovery that a spiritual autocracy was as liable to abuse as a temporal one, was not yet made, and we must judge Anselm by the spirit of his own times. It is this fair and candid criticism that forms a chief merit of Mr. Church's book. Dr. Hook, in his *Lives of the Archbishops of Canterbury*, would be fair to Anselm if his theory would but let him; but he is too true a modern Churchman for such a thing to be possible. It is thus instructive to compare the two narratives.

We would call attention to Mr. Church's chapters on the "Monastery of Bec," and the "discipline of a Norman monastery," and "Anselm at Bec" as specially illustrating the fairness which is able to see that different modes of action suit different ages which yet have the same great end in view.

Anselm, however, was something more than a combatant for the Church against the State. His subtle Italian nature was far more eager to master the world of thought than the world of action. He took up the great argument of natural theology, the proof of the existence of God, in the *Monologion* and *Proslogion*—in the first, showing that the existence of good in man and in nature can only be accounted for by their derivation from the one Good Being; in the latter anticipating the argument of Descartes, that the idea of God in the human mind of itself necessarily involves the reality of that idea. In the *Cur Deus Homo* he considers the inner necessity of the Christian scheme. On his death-bed he was turning over in his mind the question as to the origin of the soul. The impulse thus given to thought constitutes to us his real greatness. The cause for which he fought was not in reality the cause of England or of Europe, and something of doubt and hesitation must attach to any attempt at defending him; but Anselm the solitary thinker who was before his age, and still more Anselm the true-hearted and sympathizing man whose life all men read as that of a friend, still lives to us as one who was a light to England in its darkest times. That many such men as Ch. de Rémusat in France and Mr. Church among ourselves, have felt towards him as Eadmer did in his own days, witnesses to his real greatness and is part of his reward.

C. W. Boase.

Contents of the Journals.

Archivio Storico Italiano, tomo xi. parte 2, 1870.—Bezzoni continues his account of the Venetian Inquisitors of State to the time when Bonaparte destroyed the Republic. Their chief care was to watch over the officials, and see that the resolutions of the government were kept secret; but they also watched over public morals, and suppressed any novelties of thought. The cases detailed are very instructive. Nothing but the storm of the French Revolution could have swept away the small isolated Italian systems, and prepared the way for Italian unity.—Banchi gives a history of the little port of Telamon, in the Sienese Maremma, as illustrating the period before the war of Pisa began, and the rise of Florence altered the political state of central Italy.—A life of Domenico Cirillo, the eminent botanist, the friend of John Hunter in London and Franklin in Paris, illustrates the advance of Italian

science in the last century.—There are good reviews of Parthey's ed. of the Mirabilia Romae (the 'Handbook' of the Middle Ages), and of Berlan's ed. of the 'Liber consuetudinum Mediolani' (the customs of the early *Commune* of 1216).—Claretta's history of the Regency of Cristina of France, Duchess of Savoy, is shown to contain evidence contrary to Claretta's own view of her innocence.—The second vol. of Bentivoglio's letters while Nuncio in France, just after the assassination of Henri Quatre, describes the wretched intrigues which made the meeting of the States General useless.—Caffi makes some corrections in Varni's list of the celebrated early artists in wood-carving.—There is a severe critique by Bongi on the Geography published as a supplement to Brunet's Manuel du Libraire: the Italian part is shown to be carelessly done, and some omissions are supplied.—A small catalogue of original documents illustrating the history of Friuli comes from the Collection of Count L. della Torre Valsassina: they chiefly relate to the Della Torre family.

In the *Literarisches Centralblatt* for Oct. 15, A. v. G[utschmid] reviews Lepsius *Ueber den chronologischen Werth der assyrischen Eponymen und einige Berührungspunkte mit der ägyptischen Chronologie.* The cuneiform inscription containing the list of Eponymi has given us a clear basis for Assyrian chronology, fortunately independent of the many difficulties which attend the deciphering of parts of the inscriptions, and especially the names of the kings. Oppert's supposition of a lacuna in the list is a mere tampering with the evidence. Gutschmid agrees with Lepsius' view, except as to the reigns being dated from the year *after* the accession; the Chinese way of reckoning is the only one that follows this plan, and it is accounted for by the Chinese ordinance of the "year of mourning." The reign of Sennacherib is perhaps the most difficult to synchronise. Gutschmid suggests that the 18 years assigned him in Berosus belong to the time of his being Over-king in Babylon, and correspond to the 19 years (699–680 B.C.), which Ptolemy's canon gives as the interval between the accession of Aparanadios and that of Esarhaddon. Again Berosus allows Esarhaddon only 8 years, while the canon gives him 13. But here Alcydenus helps us by inserting a 5 years' rule of Esarhaddon's brother Nergil-Sharezer, so that there was probably a contest for the succession. The statements about Pul (Poros in the canon), which occur in 2 Kings, xv. 19, 1 Chron. v. 26 (the first Assyrian king mentioned in the Bible also cause great difficulty. The whole enquiry has been complicated by premature and useless attempts to reconcile all the statements in Kings and Chronicles with those in the inscriptions, and the tendency to find biblical names everywhere in the Assyrian annals. Nor have our decipherers been sufficiently careful in distinguishing between what is fairly made out and what is mostly guesswork, *e.g.*, is it quite certain that Miluchcha is the classical name Meroë? Naturally this has led to some distrust of their whole scheme, as the article in the July number of the *Edinburgh* shews, an article the tone of which cannot be justified even by the somewhat exaggerated pretensions of Assyrian scholars, for it allows next to nothing for the progress actually made, or for the very great difficulties attending the work of interpretation. Gutschmid also agrees with Lepsius that the only synchronism certainly made out between the Assyrian and Egyptian annals is that in the reign of Tirhakah. It is to be wished that more of the vast collection of inscriptions in the British Museum could be published, and more rapidly, so as to be more generally accessible to scholars.

Oriental and Comparative Philology.

An Assyrian Dictionary, by Edwin Norris. Vols. I. and II. London: Williams and Norgate, 1868, 1870.

THE Assyrian researches of English and French philologists have now reached a stage at which it seems appropriate to sift and arrange results. It is the merit of Oppert (by birth a German) to have taken the first step in this direction by the publication ten years ago of the first Assyrian Grammar. The still more difficult task of forming a lexicon has been undertaken by Mr. Norris, so well-known to Orientalists by his excellent dissertations on the cuneiform inscriptions of the second class, and by his share in the editing of *The Cuneiform Inscriptions of Western Asia* (London, 1861, 1866). A friend has generously contributed to the expenses, and the two large volumes before us are an instalment of the work.

Only those who have to some extent gone over the same ground as the author can fully appreciate the combined courage and conscientiousness to which every page in these volumes bears witness. We earnestly trust the work may soon be completed in the same admirable style. At the same time it is our duty to point out a few defects (as we venture to think them), in the hope that the author may to some extent avoid or remedy them in the succeeding volumes.

One of our principal objections is a formal one. Contrary to the usage in Semitic lexicography, Mr. Norris has arranged the words and roots, not upon etymological principles, but as they are written in the Assyrian texts. To account for this seemingly capricious arrangement, the reader should remember that each Assyrian character has more than one value, and hence the same word may be written in very different ways, added to which the characters are partly syllabic, partly ideographic. Thus, if we wish to write *samas* (שמש) "sun," we can either employ the characters for *sa* and *mas*, or else two others pronounced *an* and *ud* respectively. We can therefore place the word under A, under D, or under S. The rule adopted by Mr. Norris is to arrange the words in accordance with the texts, *e.g.* the word just mentioned is placed under D, because it is generally written *an-ud*, and besides *an* is merely a so-called determinative ideogram. This example will be enough to show how much the application of this method depends on the fancy of the lexicographer; in fact, we have often failed entirely to discover the motive for the particular arrangement adopted. Of course, a plan once adopted in a work of this sort cannot be abandoned; we can only urge upon the author the desirableness of an index at the close of the whole work, to contain all the words, arranged according to the roots, and transcribed in Roman characters, with references to the pages on which they are explained. The

index to the Khorsabad inscription, published by Oppert in the *Journal Asiatique* for 1865, might be taken as a pattern, omitting, of course, the explanations. Such an idea, if closely printed, would hardly occupy more than three sheets.

Two other points may be briefly noticed. We venture to think that Mr. Norris is hardly thorough enough in his comparison of the cognate languages, and has not given sufficient weight to the laws which regulate the interchange of sounds. Thus on p. 234, at the word *idiu*, "warrior," we are surprised to find the derivation from the Arabic عدل (*'adala*), rejected, and at the word *qardu*, which so often accompanies the former, to miss a reference to قرض, "to oppose." In the catalogue of syllabic characters, the equivalents are not always fully given, *e.g.* the character for *si* and *lim* should also have the value *pan*, which is wanting too in the *Addenda* prefixed to Vol. II. And among the characters for compound syllables we miss in No. 15 the value *kir* (*Syll.* 544).

In conclusion, we heartily appreciate the fullness of the quotations from the Assyrian texts, which are given in the cuneiform characters, and followed by a translation; as well as the essential service rendered by Mr. Norris's *Dictionary* to Biblical studies. An instance of the latter is the list of Assyrian months on p. 50, which throws an unexpected light on the origin of the Hebrew names of the months.

E. SCHRADER.

Field's Edition of the Hexapla. [*Origenis Hexaplorum quæ supersunt: concinnavit, emendavit, et multis partibus auxit Fridericus Field.* Tomi ii., Fasciculus iii. Ezekiel, Daniel, Prophetæ xii. Oxonii: e Typographeo Clarendoniano, 1870.]

AMONG the most complicated tasks of textual criticism, is the correction of the Septuagint; and among the most important aids in the accomplishment of this, is Origen's *Hexapla*. The same difficulties which beset the modern editor were already in existence in the time of Origen. The caprice of transcribers, and the desire to assimilate the Septuagint to the current Hebrew text or to the other Greek translations, had produced so great a variety of readings as to extort the complaint from Jerome, "Toto orbe diversa est." To correct this deplorable condition of the text was the object of the *Hexapla*. Written, as its name indicates, in six columns, it presented side by side the Hebrew text in Greek as well as Hebrew characters, together with the versions of Aquila, Symmachus, the Septuagint, and Theodotion. But the chief attention of the editor was devoted to the Septuagint, the additions to which in the other versions were distinguished by the mark —, and the omissions by ※.

Unhappily the *Hexapla* has ceased to exist except in fragments scattered through the works of the Fathers, and first collected in 1714 by Montfaucon, who added a certain number of various readings. Montfaucon's work, however, excellent as it was for its time, fails to satisfy the requirements of modern critics, and is indeed but rarely to be met with; while Bahrdt's edition is useless, as he omitted all Montfaucon's notes. There is therefore ample justification for Mr. Field's new revision of the text, which has been accompanied by an independent collation of the best MSS. The critical notes are especially valuable, containing as they do, not a few patristic quotations, and, where necessary, conjectural emendations of the text offered by previous scholars. Mr. Field has also attempted to restore the Hebrew text as read by the several Greek translators in cases where their version is not in accordance with the Masoretic text, and these readings are often very plausible, as for instance, in the fasciculus before us, בְּגֹוִים for בַּגֹּרִים (Hab. i. 5), where O' has ἴδετε οἱ καταφρονηταί; comp. Hab. i. 13. The reading, לְכִנְעֲנִי for לבן ענוי (Zach. xi. 7), where O' has εἰς τὴν Χαναανῖτιν, is fully confirmed by a fragment of a ninth century MS. at St. Petersburg. In some other passages Mr. Field's conjectures seem less judicious; *e.g.*, Ezek. xxi. 10 (15), where O' has ἑτοίμη εἰς παράλυσιν· σφάζε, ἐξουδένες, and Mr. Field proposes (after Hitzig) the reading שָׁחֹט בִּיי for שבט בני. The passage is certainly difficult; the Vulgate has quite a different version, "Qui moves sceptrum filii mei, succidisti omne lignum," which points to the reading, נשיא מאסתּ. Perhaps the Septuagint translator read אל נשם, from שסם, "to plunder." So, too, in Amos vii. 14, where Σ. renders ἔχων συκομόρους, reading perhaps בעל שקמים; and Hab. ii. 17, where O' renders πτοήσει σε, and the Peshito תרלחך, "exagitabit te;" and we should have expected to find Mr. Field proposing to read יְחִיתֵךְ for the Masoretic יְחִיתַן, an emendation which occurs in the margin of the St. Petersburg fragment. In the note on Zech. xiv. 5, Mr. Field rightly gives וְנָסְתָּם as the Hebrew equivalent of the Septuagint's καὶ φραχθήσεται (our editions of the Hebrew have וְנַסְתֶּם). But he should have mentioned that this reading is one of those on which the Masoretic schools of Babylon and of Palestine differ (Madinḥai and Ma'arbhai), and ought not to have omitted the rendering of the Targum, ויסתתים. These points, however, are but of secondary importance; and the numerous extracts from the Syrian translation of the *Hexapla* are of great value to the student. For although the Syriac in question has been already edited by Masius, Norberg, De Rossi, Bugatus, and, above all, by Middeldorpf (from MSS. in Paris and Milan), Mr. Field has furnished some more accurate readings from the Milan MS., through the kindness of the well-known Syriac scholar, Ceriani of the Ambrosian Library. In short, Mr. Field has made the best use of the critical apparatus at his command; and his work will probably remain the standard edition, unless some fortunate discoverer should one day present us with a complete copy of the original *Hexapla*. AD. NEUBAUER.

An Arabic Reading-Book, compiled by Dr. W. Wright, &c. Part First. The Texts. London: Williams and Norgate.

THE first requisite in a good chrestomathy is a practical selection of classically written texts, in which the various literary styles shall be fairly represented, and the stages of the beginner's progress made as gradual and easy as possible. The passages selected should as a rule be short, as it is a refreshment for the learner to pass quickly from one lesson to another, instead of plodding wearily through an extract of many pages. The second is that the text should be correct, and as free as possible from errors of the press, a point in which some of the older chrestomathies, as for instance those of Freytag and Arnold, leave something to be desired. Dr. Wright's *Reading-book* may safely challenge examination in both these important respects. It supplies a copious selection of texts written in various styles and on various subjects. Beginning with fables, it proceeds to historical, biographical, and geographical descriptions; and these are followed by specimens of the grammatical and philosophical style, the language of the Koran and rhymed prose. The conclusion is formed by some specimens of ancient Arabic poetry, accompanied by a commentary. None but masterpieces of classical style are admitted, *e.g.*, Ibn Hishâm, Almubarrad, Ibn-al athîr, Ibn Khallikân, Zamakshari, Ḥarîrî, and among the poets, Imruulḳais, 'Alḳama, &c. The punctuation is complete and accurate. That no unpointed text is given seems to us quite reasonable. Advanced scholars must in time accustom themselves to do without points, but the best preparation for

this is the reading of carefully-pointed texts. We have no doubt this Reading-book will soon be as much appreciated as the excellent Arabic Grammar by the same author. The second part of the work will contain a glossary. Our only regret is that the cost of Dr. Wright's *Reading-Book* will render it practically inaccessible to many students of Arabic in the German universities. ED. SACHAU.

THE MOABITE STONE.

Although M. Ganneau still withholds his photographs, dissertations on the Moabite stone continue to flow in. The last month has brought us an article in the *North British Review*, which we can hardly be wrong in assigning to the competent pen of Dr. Wright. Almost simultaneously appeared an elaborate work on the same subject by the well-known Hebrew scholar Dr. Ginsburg. Both writers begin with an account of the discovery, and of the previous attempts to decipher the inscription, followed by the text itself, an English translation, and grammatical, geographical, and historical notes. Dr. Wright's transcript of the text is particularly useful, being pointed; his notes are illustrated by the other Semitic languages, and concise though clear. Dr. G.'s commentary is, in our opinion, too prolix, and contains statements familiar to every advanced student. It is true that the author claims credit on this very ground in his preface, but the necessity of emending the text by conjecture scarcely enables him to fulfil his pledge of guiding "every ordinary reader" to the correct meaning. A peculiar feature in Dr. G.'s work is the very useful glossary at the end. Both writers are eclectic, but both have proposed some new interpretations, or new arguments in favour of previous conjectures. We shall only mention the most important ones. Dr. Wright, on the authority of Eusebius, pronounces Daibon instead of Dibhon, and observes that Qarḥa and its variations are names of places in Arabic. Dr. Ginsburg suggests, in l. 4, עמרי מלך, and considers *Omri* to be dependent on הראני, which is contrary to the Hebrew idiom. The examples he quotes are scarcely in point, as they present three substantives together, a case in which the ו may properly be omitted, and these substantives are not at all dependent upon verbs. Besides ויענו, in l. 5, presupposes a verb in the clause referred to. Possibly we should read עמנרי הוא מלך ישראל. In l. 8, Dr. Ginsburg argues, with Dr. Weir, that the monument was erected in the reign of Jehu. This opinion was first broached by S. Sachs in the *Revue Israélite*, as we stated in the *Academy*, vol. i. p. 217. But, not to mention that the second book of Kings is against this view, the lacuna must *ex hyp.* be filled up with the words "by his son, his son's son, and his son's son's son," for which there is certainly no room. In l. 9, אֲשׁוּחַ, as Dr. Wright reads, is no doubt the true form, and not Dr. Ginsburg's אֲשׁוּחַ. In l. 13, the latter scholar reads שבן (= Sibmah), for שרן; and we have no doubt that the true reading of the Targum of Jerusalem is שבן, and not שרן. But while we award Dr. Ginsburg the praise of ingenuity, we cannot deviate from the reading of the inscription, which is clearly שרן. May we venture to take Dr. G. to task for asserting that שרן does not occur in the Scriptures? we have already pointed out in the *Academy*, vol. i. p. 272, that it is mentioned in 1 Chron. v. 16 as belonging to the tribe of Gad. On l. 17, Dr. Wright suggests that the Syrian deity Atergatis is to be explained as עתר עתא, "the 'Attar of 'Athê." A similar derivation had been already proposed by ourselves in the *Géographie du Talmud*, p. 305. In l. 23, Dr. G. would translate "the prison of men . . .;" but why should Mesha boast of having constructed prisons? Here we are inclined to accept Schlottmann's מין כלאי האשדת, and translate "reservoirs for water." Mesha is speaking of the want of water in Qarḥa. In l. 25, Dr. Wright adopts Neubauer's reading, with an improvement, substituting באסרי for באנשי. Dr. Ginsburg reads בחורי, but unsuitably. In lines 27 and 28, Dr. Wright's way of filling up the lacuna, "for I left behind in it men of Dibon, fifty [in number]," is very attractive, but the three parallel כי seem to require separate antecedent clauses. We may remark that עצר gives the same sense as עזב; see Deut. xxxii. 30, &c. The same objection applies to Dr. G.'s suggestion, "for it was cut down by the fifty men." We are curious to know in which passage עצב means "to cut;" to get this sense the root עצר (Isa. xliv. 12) would be preferable. In l. 28, Dr. G. supplies, "And I saved from my enemies Bikran." He should rather have rendered "from the hand of my enemies," for משנאי alone may be Moabitish, but cannot be Hebrew. As for the word מלא, in the sense of "fortress" (proposed by us), which Dr. G. denies to be Biblical, we must refer him to the Concordance for nine passages in which it occurs, especially for 1 Chron. xxx. 5, where מלא is explained by "the city of David." That the plural may be either מלאות or מלאים is clear: the author of the suggestion did not affirm that the verb מלא is to be found in the sense "to construct a fortress," but that in the Semitic languages a verbal form can be derived from every substantive. We have only to add that Prof. Schlottmann's latest views on the Moabite Stone, based on Ganneau's new readings, are to be found in the current number of the *Zeitschrift der deutschen morgenländ. Gesellschaft*. Professor S. now renders line 8 thus: "And Israel dwelt in it (Medhebha) in his time, and the time of his sons (*i.e.* Omri) and Ahab) 40 years." But the parallelism would rather require "Jehovah dwelt in it." We have already mentioned his reading of l. 23. Dr. Geiger's article in the last number of his periodical is little more than a reprint of that inserted by him in the *Zeitschrift der d. m. G.*

An important conjecture proposed by Mr. Bensly, Sub-Librarian of the University Library, Cambridge, has reached us at the last moment. On l. 15, where the present text reads רקע, he would substitute בסע; comp. Isa. lviii. 8, יבקא כשחר. AD. NEUBAUER.

Intelligence.

It is with deep regret that we hear of the death of the distinguished Italian historian and Orientalist Michele Amari. He was born at Palermo in 1806, and lived there till 1842, when the attention of the Neapolitan Government was attracted by his work *La Guerra del Vespro Siciliano*, and he received a summons to appear at Naples. Instead of obeying the order, Amari fled to Paris, where he brought out a second edition of the History of the Sicilian Vespers in 1843. It has since passed through several editions, and been translated both into German and English. During his residence in Paris, Amari devoted himself with much success to the study of Arabic. The German Oriental Society undertook the publication of his *Biblioteca Arabo-Sicula*, a collection of extracts from Arabian authors regarding the history, geography, and Mahommedan literature of Sicily. He also wrote a translation of Ibn Zafer's *Solwán al-Motá*. After Victor Emmanuel became king of Italy, S. Amari returned to his native land, held office for a time at Florence as Minister of Public Instruction, and was appointed Professor of Arabic in the University. Since then he has edited, with a translation and notes, the Arabic documents in the royal Archives at Florence (*I diplomi Arabi del R. Archivio Fiorentino*, 1863, Appendice, 1867), and a catalogue of the small collection of Oriental MSS. in the Lucchesiana at Girgenti. But his great work, which we fear he has left unfinished, is his History of the Musulmans of Sicily (*Storia dei Musulmani di Sicilia*, vol. i. 1854, vol. ii. 1858, vol. iii., part i., 1868). Personally M. Amari was a most amiable man, beloved and respected by all who knew him.

Mr. E. H. Palmer has presented his first report to the Committee of the Palestine Exploration Fund, on his researches in the Tîh and the country of Moab. His sojourn in Moab was "expensive and unsatisfactory." He is convinced, that "above ground at least, there is not another Moabite stone remaining." On the other hand, he has copied a large number of Hebrew *graffiti* at Jerusalem, and hopes great things from some inscriptions found at Hamáh (Hamath), which have not yet been deciphered. The report is given in full in the *Times* of Nov. 7.

Trübner's American and Oriental Literary Record has entered on its sixth year, and maintains its character for exact bibliographical information. The October number contains, *inter alia*, the text of the congratulatory address to the founders of the German Oriental Society, a notice of the Catalogue of Sanskrit MSS. in Bengal, the first part of which has been lately published, and a further communication from Mr. R. C. Childers on the meaning of Nirwána.

Classical and Modern Philology.

The Characters of Theophrastus: an English Translation from a revised Text, with Introduction and Notes, by R. C. Jebb, M.A., Fellow and Assistant Tutor of Trinity College, Cambridge, and Public Orator of the University. London and Cambridge: Macmillan, 1870.

THE present state of the Greek text of the book known as *Theophrastus' Characters* is a noteworthy illustration of how much has been effected for the classics by the labours of many generations of critics. It marks with the accuracy of a thermometer how much has been done in the past, from how much still remains to be done; and it indicates, but more obscurely, how much there is which can never be hoped for.

If we take the book as we now read it in the current editions, and compare it with itself as it stood in the Ed. Pr. 1527, it may almost be said that our book has been written by the critics. But though a modern Hardouin might amuse himself by using this book to prove that the classics are books written by the Germans, yet, when we come to take it to pieces, we shall rather be surprised at the high degree of probability which belongs to much of the results of their labours. Scepticism as to the validity of our critical canons, and to the general prudence with which they are applied, is not justified by the current text of *Theophrastus*. On the other hand, there is in the current text a large margin of emendation outside the points that can be considered settled. This variable or unsettled portion of the text, indeed, bears so large a proportion to the whole, that we can scarcely, with strict propriety, speak of a "Vulgate" text of *The Characters;* each edition offering, as the work of Theophrastus, a book of very different contents.

The tradition has come down to us in an unusually large number of MSS. Thirty-six are already known. This is a larger number than most Greek classics can show. But in this instance, as in others where a large number of MSS. are found, collation discloses the fact that number is no guarantee of correct text. In the latter half of the last century (1763, not 1767 as Mr. Jebb says) J. F. Fischer published an elaborate collation of MSS. and early editions. Fischer's *apparatus criticus* supplies a striking example of the futility of the accumulation of various readings before the relationship of the MSS. to each other has been accurately determined.

In the case of the *Characters* this relationship is now certainly known. But in arranging our thirty-six MSS. into families, we come across another distinction among them which gives a peculiarity to this case. The distinction is that they present the text in three degrees of expansion or contraction. This fact is material in the history of the transmission of the book. There are three texts: (1) the fullest text; (2) the abridged text; (3) the intermediate between the fullest and the most contracted.

The mass of the thirty-six MSS. belong to the third class, and offer a text which is intermediate between the full and the abbreviated. The second, or abbreviated, text is represented only by one MS. of late date, 15 sæc. The first, or the full, text is also found in only one MS., now usually designated as the *Palatino-Vaticanus*. It is, according to Cobet, of cent. 14. It is subject to two defects: (1) it contains only the last fifteen characters (out of thirty); (2) it offers the text in a most corrupt state, having many words which are not even Greek at all, and many lines of Greek which are not intelligible.

The *Palatino-Vaticanus* is the only MS. which exhibits the fuller text. It discloses a fact, which but for it could never have been known, that the book, as read in the mass of the MSS., is an abbreviated book. The light thus thrown on the origin of our book is even more important than the additions actually made to our text by the *Palatino-Vaticanus*. Yet these additions are considerable. They amount to one whole character (char. 29), and to about 125 lines in the remaining fourteen characters. The total number of lines (typographical) of which the whole book consists, in the Vulgate recension, may be taken as 760. The total number of lines which the *Pal. Vat.*, had it contained the whole thirty characters, would have added to the text, would have been 250. The epitomator, therefore, who wrote the Vulgate, has retrenched about 250 lines out of 1010, *i.e.* about one-fourth of the whole.

By what principle was the epitomator guided in abridging? Did he desire to reduce into shorter compass a book already so short? This was not, or was not his only, view in abridging. The omissions in the Vulgate are, mainly, omissions of the unintelligible.

Was the Vulgate text abridged from our *Pal. Vat.*? It was not; for the *Pal. Vat.* is of the 14th century. But we have two copies of the epitomised text which are as early as the 10th century at least, the Paris A. and B. The abridged text is therefore at least as old as the 10th century.

On the other hand it can be shown by evidence too minute to be here detailed, that the Paris A. and B. of the 10th century, and the *Pal. Vat.* of the 14th century, are derived from a common source. They had, not a common father, but a common ancestor. This common ancestor

must have been dilapidated and greatly illegible in the 10th century.

This is all the evidence which is attainable from the condition of the MSS. as reported. This condition raises various questions which the evidence does not answer. In particular, the circumstance of two abridgments having been made, naturally suggests the question, Was the archetype itself, the common parent both of the *Pal. Vat.* and the Paris A. and B., a work of Theophrastus, or was it already an abridgment or extract from a larger work or works? Much ingenious combination has been expended on this enquiry. It is by no means to be asserted that the enquiry leads to nothing. Something like evidence has been collected by the laborious researches of Usener and Petersen. As the argument stands at present there appears to be a probability that in the fullest text of the *Characters* we have only an excerptor's book. The *Characters* are fragmentary extracts of striking bits from a general treatise on Ethics. Theophrastus followed, in the arrangement of this treatise, the order of topics in his master's *Nicomachean Ethics*. He inserted in it sketches of character in which he allowed himself much more dramatic play than is found in the severer delineations of the fourth Book of the *Nicomachean Ethics*. Excerpts from these sketches, combined into a book by a spiritless preface and nonsensical head and tail-pieces, form our book of *Characters*. This is a theory of which the probability will be likely to recommend itself more and more as the subject is dwelt upon. But it is only a probable theory. It affords no basis for an editor to proceed upon. The problem proposed to the textual critic is not at all to attempt to restore *Theophrastus*. To the condition of the archetype no criticism can now penetrate. The diplomatic tradition goes back to the 10th century. We have no means of passing this limit, still less of filling up the vast chasm of twelve centuries which separates Paris A. and B. from the time of Theophrastus. We cannot even aim at ascending to the common ancestor of Paris A. and B. and the *Pal. Vat.* The definite aim of an editor of *Theophrastus* must be to render so much as the abridger or copyist in cent. 10 could decipher. In other words, to give the text of A. and B. for the first fifteen characters, and of the *Pal. Vat.* for the last fifteen. The remaining MSS. are valuable as affording the evidence on which rests the unique character of sole authority attributed to the other three, and have no further use.

The doctrine here laid down that an editor must make it his object to reproduce the 10th cent. A.D. and not the 4th cent. B.C., is condemnatory at once of many proceedings of many editors. *E.g.*, a very favourite mode of dealing with *Theophrastus* is transposition. The application of transposition to *The Characters* is favoured by the circumstance that one certain instance of displacement is diplomatically established. In char. 11, βδελυρίας, there is found, not only in the inferior MSS., but in Paris A. and B., a paragraph, forming in bulk half the character—the concluding half. The contents of this paragraph seem to us to be anything but a description of the βδελυρὸς. But inappropriateness can go for nothing in this book, if the principle be conceded that we are to reproduce not *Theophrastus*, but an excerptor, and an excerptor who was capable of writing the definitions which head each character. This irrelevant paragraph, therefore, must have retained its place in char. 11, had it not happened that when the *Pal. Vat.* was discovered in 1786–88, this very section which stands in every other MS. to the credit of the βδελυρὸς, was found in a place where it is entirely appropriate, viz., in the last character, char. 30, that of the αἰσχροκέρδης, embedded in the middle of remarks which form with it a consistent and unmistakable whole. Here is a case of transposition, which would have been suggested by irrelevancy, and is diplomatically established. Upon this hint the transposers proceed, and wherever they detect inappropriateness, or even disconnection, claim a right, founded on this precedent, to replace a sentence in a better position. Otto Ribbeck has characteristically caught at this straw, and has proposed transpositions in the characters to a large extent (*Rhein. Museum*, Jan. 1870). Granting that these transpositions are all "improvements of the sense," yet they are all excluded by the view of an editor's duty here contended for. All these transpositions assume as their justification that such a collocation of paragraphs could not have proceeded from Theophrastus. Granted that it could not. But we have not Theophrastus's book. Our book is a set of excerpts collected in the 10th cent., or not later than the 10th cent. That is the book which we have to reproduce in type. The removal of the paragraph which in Paris A. and B. stands in char. 11 to char. 30 is right; not because it is appropriate in the one place and not so in the other; not because Theophrastus must have so placed it, but because it was so placed in the excerpta. This is the fact, as we now know from the *Pal. Vat.* How it got into char. 11 in all the other copies, we may conjecture. It was the outside fold of the roll, or the last leaf of the volume, and so liable to become detached, and then inserted in the wrong place. Its case is peculiar, and affords no analogy for the justification of other transpositions.

The same view of an editor's duty will condemn another arbitrary procedure to which Mr. Jebb has resorted. The 30 characters, as they have come down to us, follow each other at haphazard. There is no transition of style from one to the next, no sequence of thought, no arrangement. This is what we should have expected in a book of excerpts. But the order, or want of order, in which they follow each other, is uniform in all the MSS. It is part of the tradition. Mr. Jebb has substituted, in his edition, a classification founded on ethical principles. This novelty is also to be lamented as a drawback to the utility of the book. Reference to the new numeration is a business so tiresome as to become practically impossible. But the practical inconvenience of a new arrangement must be submitted to when the re-arrangement is commanded by a critical demonstration. In the present case there is not only no demonstration, there is no evidence for a rearrangement. That Theophrastus' treatise, Τὰ ἠθικὰ, may have observed a better psychological method is possible. A historian of philosophy endeavouring to draw up an account of Theophrastus' remains may dwell on this possibility. To the historian properly belongs the "freiere Behandlung des Ueberlieferten" which Otto Ribbeck claims to exercise. An editor of *The Characters* cannot proceed upon such a basis, or attempt to consider "what Theophrastus may have written." Prof. Ribbeck is dissatisfied with Petersen's edition. He calls it "ungeniessbar," and classes it with Ussing's, a very inferior book. Not to mention the valuable Prolegomena which are prefixed to Petersen's book, his text seems to be based on a sound principle, though he has adopted individual conjectures which he would now recall himself.

It may be unfair to try Mr. Jebb's edition, which only professes to be a schoolbook (it is expurgated for the purpose), by a critical standard. A scholar like Mr. Jebb would, no doubt, have himself preferred to give a scholar's book. If the conditions of publication in a "practical" country have forced him to do inferior work, he deserves sympathy rather than blame. Yet by adding to an Introduction, and illustrations of a very slight and popular character, a body of "Critical Notes," his book brings itself within the

range of philological criticism. The critical notes are almost wholly a selection from the previous editions, though they offer some original conjectures of Mr. Jebb. Of these conjectures one deserves mention. In char. 28 (21 Jebb) the *Pal. Vat.* has καλεῖται γοῦν ἡ ψυχὴ κρινοκόρακα. For the monstrous collocation of letters κρινοκόρακα, Mr. Jebb proposes Κορινθιακῶς, "she is called 'my life' in the language of Corinth." This is very ingenious, nay, witty. But it cannot be right, for several reasons. One is sufficient. The γοῦν shews that the word wanted is an epithet which should be the reason of the previous assertion that "his mother was *well-born*."

MARK PATTISON.

The Fragments of Plautus' Vidularia. [*Ind. schol. in universitate litteraria Gryphiswaldensi per semestre hibernum anni* 1870-71 *habendarum.*] By W. Studemund. Greifswald, 1870. pp. 26. 4°.

THE newly-appointed professor at Greifswald, W. Studemund, already well known to all students of Plautus by his treatise *De Canticis Plautinis* (1864), and his subsequent important contributions to the *Hermes* and *Rheinisches Museum*, gives here a complete edition of all that exists of the *Vidularia*, the twenty-first of the comedies considered genuine by Varro. As early as the time when the old MS. of Camerarius was written (saec. xi.), this play seems to have been lost, as the MS. in question concludes in this manner, "Truculentus explicit, incipit Vidularia," though it seems evident that nothing more was ever contained in it, thus leading to the conclusion that by some mishap the *Vidularia* had been torn off in the archetype from which the MS. *B* was copied. From the few citations of isolated passages from the *Vidularia* in the grammarians, but very little could be ascertained, and they were even apt to lead to very erroneous suppositions, as Professor Studemund shows by the example of my own assumptions concerning some features of the plot of the *Vidularia*, based of course on such imperfect knowledge of its fragments as we possessed in 1864. It is true, some new fragments had been published from the Ambrosian palimpsest by A. Mai in 1815, but owing to Mai's great carelessness, very little could be gained by them. Professor Studemund has now succeeded in recovering and deciphering seventy-three lines, and by their help has reconstructed the plot with considerable certainty. In the first scene, consisting of thirty-eight lines, Nicodemus, a young man who was shipwrecked, lost his "vidulus" (whence the name of the play), and had found a shelter in the house of a poor fisherman, Gorgo, offers himself as servant to a rich old man, Dinia. In the second scene Cacistus and Gorgo quarrel about the vidulus, which had been found by the latter, but appropriated by the first. Gorgo finally carries the vidulus away, Cacistus remains, and Dinia and Nicodemus appear, the first being now acquainted with Nicodemus' misfortune, and promising his assistance. The rest can only be guessed. Cacistus informs Dinia where his vidulus is, it is now delivered into Dinia's hands, and on its being opened a ring found in it proves Nicodemus to be the son of Dinia. There seems also to have been a love-intrigue with a certain Soteris whom Nicodemus finally marries, after she has also been proved to be of free birth and descent. Here we feel inclined to supplement Professor Studemund's conjectures as to the plot of the play, by assuming that the *Leno* mentioned in the twenty-first fragment was the one in whose power Soteris originally was; a supposition strengthened by the parallel plot of the Rudens, to which the *Vidularia* bears the most striking resemblance. This may be admitted, though it shall be candidly confessed that Professor Studemund interprets the fourteenth fragment more justly than I did in my treatise on the *Aulularia*.

As concerns the text given here, we cannot but speak very highly of the editor's sagacity in reading and emending his palimpsest, and of his caution in abstaining from mere metrical corrections. It is surprising—and to the professed hiatus-haters, no doubt, annoying—to find in about seventy new lines two decided instances of hiatus, admitted as legitimate by some critics, but persecuted by others. Professor Studemund is, I am glad to observe, of the same opinion as developed by myself in my introduction to the *Aulularia*, p. lx. sqq., in admitting hiatus in the cæsura penthemimeres of a senarius; fr. ii. v. 29, "quam me óravísti | út darem tibi faénori;" ib. 34, "defaéneráre | hóminem egentem haud áddecet" [so we should write, the MS. having "hau decet"]; but then it is true that we have also two other passages with inadmissible hiatus; fr. i. 7, "dare póssum, opinor, sátis bonúm operárium" (where the editor proposes "bonum me op."), and ii. 32, "qum míhi, qui vivam, cópiám inopí facis," lines which will have to be added to the instances collected by C. F. W. Müller in his *Plautinische Prosodie*, p. 537, sq.

We purposely refrain from adding conjectures on the lines now first published by Professor Studemund, but observe that in the thirteenth fragment it is absolutely necessary to scan "nesció qui seruos é myrteta prósiluit," ⏑ – ⏑ –, thus making the whole an octonarius iambicus. Query: fr. ii. 10, ought we not to fill up "myrtos" or "myrta"? The whole line was perhaps "vérbero illic ínter myrta ástute insidiás dedit."

In his notes on the text the editor gives valuable and exhaustive observations on "unus," seemingly used as an indefinite article by the comic writers, on the construction "impertire alicui aliquid," on "em" in an apodosis = "tum," and on the spellings "mercennarius," "quallus" and "qualus" (the latter adopted by Mr. Munro in Horace, *Od.* iii. 12, 4), and "narare" (cf. "gnarus").

In conclusion I recommend the present treatise as an excellent specimen of sound and methodical investigation and disciplined research.

W. WAGNER.

On the Influence of the Germanic Languages on those of Finland and Lapland. [*Ueber den Einfluss der germanischen Sprachen auf die finnisch-lappischen.* Eine sprachgeschichtliche Untersuchung.] By Wilh. Thomsen. Translated from the Danish by E. Sievers. Revised by the Author. Halle, 1870.

IT very seldom happens that the investigation of foreign words imbedded in any given language can be made of interest and importance for the study of the language from which they are borrowed, over and above the ordinary aim of such enquiries, viz., the etymological sifting of the vocabulary of the language which borrows them. We have, however, one instance of this in the large number of words of Germanic origin, which have been taken up into the Finnish and Lappish languages. These words reach back to a time coeval with, and even anterior to, the oldest monumental relics of Germanic speech. Withdrawn in this manner from the main stream of development in the language to which they belong, and preserved in the texture of a foreign language which has changed but little, these words have retained, even to the present day, their ancient form and character, which have been long lost in their original German home. They thus present an extremely interesting example of relics of old Germanic language preserved in the mouth of an actually existing population. This subject has already attracted the attention of Norse scholars (Ihre, Rask), and more recently, of some of the great Germanists, F. Dietrich, J. Grimm, and L. Diefenbach. Hitherto, however, no scholar has been found with a sufficiently perfect and thorough knowledge of *both* of the groups of language con-

cerned, to treat this question in an exhaustive and comprehensive manner. In the work before us, Dr. Thomsen has shewn that he possesses this requisite knowledge; and his careful digging out of the necessary materials, as well as his conscientious and methodical account of the results which he has arrived at, give this first work of his a permanent value.

The author is quite right in clearing the way for his inquiries by a short description of the two main branches of the Finnish race, including the Lapps and Finns (*Suomalaiset*) in the narrower sense, of the development of the original Finnish-Lappish language into its Finnish and Lappish varieties, and by a precise comparison of the corresponding sounds in each. This last often furnishes the means for determining the original form of the embedded Germanic words. For the variations of the Lappish system of sounds from the Finnish leave their mark upon the German words which exist in either language; and it is necessary to bring the different Lappish and Finnish forms of any given word into some sort of agreement, before any conclusion can be arrived at respecting the Germanic original which preceded them both. On the whole it appears that the Finnish system of sounds is at once of earlier date and better preserved than its Lappish sister, especially in the case of vowels. Hence it follows that the Finnish form of a word of Germanic origin is in general the more genuine, *i.e.* the less modified, these modifications consisting only of certain peculiarities of the Finnish sound-system in general, such as the simplification of the groups of consonants at the beginning, and the frequent addition of a vowel at the end, of a word.

The fundamental assumption upon which the enquiry is based, is that all those words in Finnish-Lappish and in German which are obviously coincident, really owe their origin to the Germanic languages. Beyond the strong presumption in its favour which is furnished by the fact of the rarity of the opposite process (the neighbouring Germanic languages of Swedish and Norwegian being the only ones into which a few Finnish words have been taken up), this generalization cannot be said to be strictly *proved*. Indeed, it would have been impossible for the author to prove it without giving in the case of every single word all the pros and cons of the claims of the two languages to its parentage. To one, however, who is acquainted with both the languages in question, this assumption commends itself mainly for the following reasons: (*a*) because the majority of these words are widely connected in the Indo-Germanic family, whereas they are not traceable in other Ugrian languages; (*b*) because there is a large number of cases, in which the Finnish languages are known to have taken up already existing words, and modified them according to their own laws of sound; (*c*) because there exists a certain number of formations, *e.g.* the nominative, the feminine, and a variety of stem-terminations, which continually appear in the Finnish, but which are only explicable upon the supposition that they belong to the Indo-Germanic family of language, and therefore to the German branch of it. The whole of the remainder of Dr. Thomsen's essay consists of the confirmation of the above principle, more particularly with reference to (*b*) and (*c*). In some few cases, perhaps, the itch of discovering the traces of German in the Finnish language has led the author to assume connections between words which are questionable and cannot be proved satisfactorily. This, however, is a pardonable extravagance; and the author does not conceal the doubtful nature of some of his instances. And, on the other hand, we may be sure that Ugrian philologists will not be slow to reclaim their alienated property.

The author lays special stress on the modifications of sound which have been superinduced by the Finnish and Lappish upon the immigrant foreign words. The quality of the German vowels seems to be preserved with the utmost fidelity, if we except some unimportant interchanges of *e* and *i*, or *o* and *u*. And even the quantity of vowels which has been lost in the existing Germanic languages has been preserved in Finnish in its primeval purity. The German diphthongs have been especially well-preserved, which proves the remote antiquity at which many of these words were borrowed, reaching back beyond the old Norse, in some cases even beyond the Gothic languages. Thus, for instance, Finn. *ai* = Goth. *ai*, which has become in Old Norse *ei*, or even *á*: *ainoa* (only) = Goth. *ainaha*, Old Norse *eink*, *einn*; F. *raippa*, Lapp. *raippe* (rope) = O. N. *reip*, Swed. *rep*; F. *airut* (messenger) = G. *airus*; F. *airo* (oar) = O. N. *ár*; F. *laina* = O. N. *lán*. So, again, *au* corresp. with G. and O. N. *au*, which in the latter language afterwards passed into *ö*: F. *autuas*, L. *audogas* (blessed) = O. N. *auðugr*, G. *audags*; F. *laukka*, L. *lavkke* (leek) = O. N. *laukr*, Swed. *lök*, which was again received by F. as *lyökki*. It is remarkable, too, that the Finnish has not yet acquired the modification of vowel (umlaut) by *i*, which appears in many O. N. words, whilst it preserves the *i* and *j*, to which the "umlaut" owes its origin: F. *kaltio* = O. N. *kelda* (fountain); L. *ruonas* (green) = *groenn*. The presence of this "umlaut," on the other hand, seems to be a sign that the word has been borrowed at a later period, as F. *penkki* (bench) = Schw. *bänk*. In the same way again the "umlaut" produced by *u* of the O. N. finds no representative in the Finnish: L. *garves* (ready) = O. N. *görr* (Old High German *garo*, Anglo-Saxon *gearu*).

In their treatment of the German consonants the Finnish languages necessarily exercised a greater freedom, as they possess only certain mute consonants (hard *k*, *t*, *p*, or soft *g*, *d*, *b*), and no double consonants at all, at the beginning of words. On the other hand, in the middle of the word the original *tenuis* in German is still indicated, at least in Finnish, by a double tenuis; an original media is indicated by a single tenuis in F. or by one of its later substitutes. F. *nuotta*, L. *nuotte* (net) = O. N. *nót*, on the contrary *paita* (shirt) = Goth. *paida*. The group *ns* is preserved more closely than in O. N., as F. *ansas* = Goth. *ans* (ansa-) O. N. *áss*.

For the Germanist scholar the following section is decidedly the most instructive, in which the author shows how the Finnish has retained in some of its German words a certain grammatical form which has no meaning except in Germanic languages. From the analogy of foreign words which are derived from the Lettish languages, the author shews that the Finnish has taken up into itself in a large number of instances foreign nouns in the nominative case, and still exhibits the characteristic Indo-Germanic *s* with a completeness of form, which even the Gothic does not any longer retain (in the old Norse it has already changed it into *r*, and it afterwards vanishes altogether). And he shews further that at least the primitive differences of stem-termination of nouns is reproduced in a distinct manner, even indicating the modification of the feminine termination; thus we find *o* (*u*) in Finn. = O. N. *u*, originally *á*. It is interesting to notice here the retention in a great many cases of the complete stem-termination *ja*, e. g. in F. *lattia*, L. *latte* (floor) = O. N. *flet*, which points to a German basis **flatja*; F. *patja* (mattress) = Goth. *badi*, O.N. *beðr* (**badja*).

This strictly methodical treatment of the Germanic words in the Finnish languages throws some light upon the primitive history of the Germanic and Finnish races. The fact that the Lappish and Finnish (with its dialects) have borrowed

the same words, and that in a form which is older than the old Norse and to some extent also the Gothic of Ulfilas, and the further fact that these borrowed words are the names of a great variety of objects and relations (dress, dwellings, politics and law, agriculture, parts of the body, &c.), and embrace besides no small number of abstract qualities (as dear, blessed, zealous, righteous, beautiful, sick); all this seems to show that the Finnish race formed a closely compacted ethnographical unit, between 1500–2000 years ago, and must have lived in close and prolonged intercourse with a neighbouring Germanic people. And secondly that the seats of this Germanic people in whom the Goths may easily be recognised from historical indications, if one takes into account the movement of the Finns westward, which may be proved to have taken place later,—must have extended from middle Russia to the Baltic provinces. Then the traces of a peculiar Norse influence upon the Finnish language may be explained in a satisfactory manner by prolonged immigrations from Scandinavia, like the later Swedish settlements in Finland and Esthonia.

At the end of his book Dr. Thomsen gives a very convenient glossary of Germano-finnish words of ancient date in all forms which concern the subject in hand, and with references to the passages of his book, where these are treated of. It is here also that the author himself expresses his doubts on some Finnish words still produced as words of Germanic origin. He would have done better if he had not used these doubtful words as proofs in the course of the investigation itself. (Comp. the articles on *epä*, *kansa*, *kartano*, *kunta*, *lafca*, *mato*, *ota*, *paljo*, *rakennan*, *sairas*, *solki*, *surku*, *utar*, *viesso*). Those on *aika*, *ansaitsen*, *kakra*, *karvas*, *kiusa*, *narka*, *buojdde*, *tila*, *vahto*, seem still to admit of some doubt.

Jos. Budenz.

Intelligence.

The Bodleian has recently purchased a MS. of Propertius, assigned by Mr. Coxe to the middle of the fifteenth century. It is a small volume, containing Propertius alone, divided into four books. The average number of lines in a page is twenty-three: the writing appears to be not quite uniform. At the end is a distich which states it to have belonged to Petrarch; but this is impossible, as it must have been written long after his death. Amongst other readings of interest are *fulvis* for *fluviis* π. 9, 12; *Rorida* for *Roscida* π. 30, 26; *crethei* π. 34, 29; *inflatis omnia*, *ib.* 32; *restabit crūnmas*, *ib.* 55; *Accersis lachrymis cantas*, iv. 1, 73; *rorida*, iv. 4, 48; *droroxatum*, iv. 5, 21; *Fac similes puros sidens esse* deos *dies*, *ib.* 34.

Mr. Skeat is preparing an elaborate edition of the Anglo-Saxon Gospel of St. Mark, from all existing MSS. The work will practically be a continuation of Kemble's A.-S. Matthew, and, like it, will give the most important text in full, in parallel columns, with the readings of the less important MSS. at the foot of each page. Owing to the inaccuracy of former editions, Mr. Skeat finds it necessary to work up all the texts from the MSS. themselves.

Mr. J. A. H. Murray's Treatise on the Dialects of the South of Scotland, forming Part II. of the Philological Society's Transactions for 1870, will be issued at the end of this year, or the beginning of next. Mr. Murray not only gives a full account of the modern language and its numerous dialects, especially his own—that of Teviotdale, but traces the history of the language,—its Anglian origin and gradual separation from the old northern English—from the earliest times to the present day. The author possesses qualifications which are not often found united in one person: he is an experienced phonetician, both theoretical and practical, a scientific philologist, and, it need scarcely be added, is thoroughly familiar with his native dialect.

The Third Part of Mr. Ellis's work on Early English Pronunciation will be ready early in 1871. It will contain a critical text of the Prologue to the Canterbury Tales, in which the orthography of the Harleian MS. will be normalized, especially with regard to the treatment of final *e*, with the pronunciation in Palæotype. Then will follow specimens of Gower and Wiclif. The rest of the volume will consist of some of the phonetic treatises employed in the investigations contained in the First Part, a Pronouncing Vocabulary of the 16th century, an examination of Shakspere's rhymes and puns, and a specimen of his pronunciation, &c.

A recent paper by F. Miklosich, in the *Zeitsch. für die österr. Gymnasien*, "On the Slavonic Elements in Modern Greek," is important from an ethnological as well as a philological point of view. When Fallmerayer broached the theory, forty years ago, that no Hellenic blood flowed in the veins of the modern Greeks, one of his arguments in support of that position was derived from the influence exercised by Slavonic languages upon the Greek tongue. He maintained that the absence of an infinitive mood, and other peculiarities, in modern Greek, were caused by contact with Slavonic forms—a point which was still further developed by his contemporary, Heilmaier, in his *Entstehung der Romaischen Sprache unter dem Einflusse fremder Zungen.* At the same time a number of words in that language were adduced, which were represented as being of Slavonic origin. The question has never been satisfactorily investigated up to the present time, for it requires a critic who is possessed of a competent knowledge of the languages of European Turkey, sufficient to prevent him from being led astray by chance similarities, and to enable him to discover the original source of a word which is found in several languages; and together with this, an absence of prepossessions on the subject, and of bias in favour of the claims of any particular language. M. Miklosich, who unites all these qualifications, professes to enter on the question with the view of testing the value of Fallmerayer's argument; and the conclusion at which he arrives is, that while both the sounds of the modern Greek language and its syntax are free from all traces of Slavonic influence, the individual words which have been imported from that source are not numerous, and that some supposed instances are really derived from Albanian, Turkish, or the Romance languages, while others have either become the common property of many of the races of the peninsula, or have passed into the Greek from the Slavonic through the medium of some other language. The catalogue of words, accompanied by discussions of the etymologies proposed for them, will have an independent value for the critical students of modern Greek.

The Earthly Paradise. A Poem. By William Morris. Part IV. London: F. S. Ellis, 1870.

Mr. Morris, in the verses to the reader which opened the first volume of his long poem, as well as in the *Envoi*, which closes its last volume now before us with an accent the most intimate and winning, has on his own account disclaimed alike ambition and prowess for the deeds that befit heroes. For other people, however, it will be difficult to avoid thinking of him as the hero in truth of a notable material exploit; inasmuch as he has in little more than three years carried his great undertaking safely through, and beyond all danger of falling, like so many poetical undertakings, into the category of things unaccomplished.

Another risk proper to the work of art which grows slowly, and takes long from projection to completion, is the risk of losing unity through change of sentiment in the artist, or through new modes of treatment or conception growing upon him unawares. It seems as if this contingency might be traced as having, within certain limits, actually befallen the progress of the *Earthly Paradise*. There is much, certainly, to maintain in the book from end to end a prevailing harmony of impression. Above all there is one never-forgotten key-note; there are the conscious love of life for living's sake, and the realised detestation of death because it puts an end to life, which at all moments of imagined festivity or delight recur with wistfulness to deplore that such things must pass away, and to desire for them immortality in the midst of denying it. All this indeed takes, if possible, a greater explicitness and importunity in the last than in the earlier volumes. In this lay the lure which first drew the Northern voyagers from their homes, and in this lies the sadness of their latter days. After the last tale of the twelvemonth's cycle is told out, the epilogue dealing with their remaining life is very short, and is addressed chiefly to their vindication against a conjectured charge of vain hope and cowardice, in seeking to escape from fate:—

"Cry out upon them, ye who have no need
Of life to right the blindness and the wrong!
Think scorn of these, ye who are made so strong
That with no good-night ye can loose the hand
That led you erst thro' love's sweet flowery land!
Laugh, ye whose eyes are piercing to behold
What makes the silver seas and skies of gold!
Pass by in hate, ye folk who day by day
Win all desires that lie upon your way!
Yet 'mid your joyous wisdom and content,
Methinks ye know not what those moments meant
When ye, yet children, 'mid great pleasure stayed,
Wondering for why your hearts were so downweighed;
Or if ye ever loved, then, when her eyes
In happiest moments changed in suddenwise,
And nought ye knew what she was thinking of;
Yet, O belike, ye know not much of love
Who know not that this meant the fearful threat,
The End, forgotten much, remembered yet
Now and again, that all perfection mocks."

Again, and in a vein less intense than the above, where in the *Envoi* the author personifies his book—despatching it, in a half-laughing manner of delightful simplicity, on its dubious journey towards "the land of Matters Unforgot," and dictating a discourse which it is to hold with the shade of Chaucer on the road—one of the first things it is instructed to say of itself and its writer is this:—

"Death we have hated, knowing not what it meant;
Life we have loved thro' green leaf and thro' sere.
Tho' still the less we knew of its intent."

And once more, in the story of *Bellerophon in Lycia*, where Philonoe urges her lover to leave her father's city because of plots laid against life, her last resort of persuasion is to a passionate amplification of the question—

"*Of the dead* what hast thou heard
That makest thee so rash and unafeared?
Can the dead love?" &c.

But it would be endless to complete the tale of instances in which this dominant sentiment asserts itself. And it remains to signify what are the points of change, and what the novelty of strain, of which we have spoken as perceptible beneath this spiritual unity, and notwithstanding the further and technical unity of a style easy and voluble in one place as in another, and calling for little castigation if perhaps it gets less, of a diction always appropriate in simple fecundity, a versification neither aiming at finish nor missing music and variety. At the beginning, then, it seemed that this story-teller was going to content himself, for sources of interest, with the primary and simplest elements of story-telling; moving his figures through incidents foreknown in the main to all of us, and, although with deliberate pause and affectionate delay devising and filling in such visible details as the mind loves to linger among, yet not working up the turns of his narrative or the inward processes of his characters to any advanced pitch of dramatic or human intensity. The work thus conceived was a new thing in modern literature, an inspiration carried out to clear and admirable success. But by degrees there have come other elements into some of the tales told,—deeper poetical motive, greater complexity of incident, greater force and subtlety of emotion, more of the conscious and sensitive modern self mingling with the ancient direct nature and all-adorning fancy. And with these has come the loss of something of the old melodious equality, and gentle maintenance of delightfulness. The fuller and more intense poems, like those of *Gudrun* or *Bellerophon*, are both better and worse than the quieter and more external or pictorial poems, like those of *The Man born to be King* or *Acontius and Cydippe*. They are full of strokes and passages that indicate ample command over whatever lies deepest, ample knowledge of passion and the heart, full imaginative and rhetorical mastery. But these things seem to need for their expression a poetical medium more concentrated and more highly wrought than this is, except now and then for some half-dozen lines; they do not, I think, lend themselves with complete propriety to that method of descriptive *cataloguing* (if one may use so ugly a word for so pleasant a thing) which is full of charm when employed on matters of lighter import.

The tale of Bellerophon is the leading one of this last volume, and is divided into two parts told by two different elders, and with a Northern tale coming between them. The former part has most of tragic intensity, dealing with the difficult subject of the passion of Sthenobœa:—

"Ut Proetum mulier perfida credulum
falsis inpulerit criminibus nimis
casto Bellerophonti
maturare necem refert."

The latter part has most of narrative complexity and suspense,

dealing with the love of Bellerophon for Philonoe, daughter of Jobates, his victories over the Solymi, the Amazons (conceived not as Attic art conceived them, but as grimly hags by mere hideousness a terror to their enemies), and the Chimæra; and some further adventures, invented in the spirit of the most vivid modern romance, in which the conqueror with the help of his love frustrates the wiles of a jealous captain of Lycia. This is a poem in its author's very best manner, full not only of sentiment and action, but of all that is most his own in sustained sweetness and minute visionary veracity, and equal affection for things homely and heroic. The poem placed between these two tells a version of the well-known tale of the bronze Venus closing her finger on the ring meant for the finger of a mortal bride—a tale employed, among others, by M. Prosper Mérimée for his *Venus d'Ille*. Note in it admirable loveliness of the following passage of nature; where Laurence, the spell-bound bridegroom of the bronze instead of the mortal lady, is on his way to an appointed encounter with a nightly train of heathen spirits:—

"At first on his left hand arose
Great cliffs and sheer, and, rent from those,
Boulders strewn thick across the sand,
Made weary work for foot and hand;
But well he knew the path indeed,
And scarce of such light had he need
As still the summer eve might shed
From the high stars or sunset dead.
Soft was the lovely time and fair,
A little sea-wind raised his hair,
That seemed as though from heaven it blew;
All sordid thoughts the sweet time slew,
And gave good hope such welcoming
That presently he 'gan to sing,
Though still amid the quiet night
He could not hear his song aright
For the grave thunder of the sea,
That smote the beach so musically,
And in the dim light seemed so soft
As each great wave was raised aloft
To fall in foam, you might have deemed
That waste of ocean was but dreamed,
And that the surf's strong music was
By some unknown thing brought to pass.
And Laurence, singing as he went,
As in some lower firmament,
Beneath the line that marked where met
The world's roof and the highway wet,
Could see a ship's light gleam afar
Scarce otherwise than as a star,
While o'erhead fields of thin white cloud
The more part of the stars did shroud."

But note also a certain vagueness and dreaminess of the senses coupled with a certain exaltation of the spirit, and constituting a subjective state for the reception of the landscape impression in this case, such as is alien from the ordinary temper of the writer. Ordinarily his landscape is the precise and delicate record of observation by perfectly alert senses free from all preoccupation, trouble, or impediment; and of this there is no better instance than the return of fishing-boats at morning seen by Laurence after his adventure is over:—

"Then from that drear unhallowed place
With merry heart he set his face.
A light wind o'er the ocean blew,
And fresh and fair the young day grew;
The sun rose o'er the green sea's rim,
And gave new life and joy to him;
The white birds crying o'er his head
Seemed praising all his hardihead,
And laughing at the worsted foe;
So, joyous, onward did he go.
And in a little sheltered bay
His weariness he washed away,
And made afresh on toward the town;
He met the fishwife coming down
From her red cottage to the strand,
The fisher children hand in hand
Over some wonder washed a-shore;
The old men muttering words of lore
About the wind that was to be;
And soon the white sails specked the sea,
And fisher-keel on fisher-keel
The furrowed land again did feel,
And round them many a bare-foot maid
The burden on her shoulders laid,
While unto rest the fishers went
And grumbling songs from rough throats sent.

In this poem we find a weakness at a critical point, in the shape of somewhat indistinct and dubious narration of that upon which the story hinges, the misadventure of the bridal night under the curse of the goddess: and in the *Bellerophon* what seems a similar lapse makes a little shadowy the fight of the hero with the Chimæra. The other tales of the volume are of Aslaug and Ragnar, of Hercules and the Hesperides, and of Tannhäuser. Of these the Scandinavian story of Aslaug, the child of Sigurd and Brynhild, and her evil fostering by a carle and carline until Ragnar comes sailing to woo and win her, is full of the brightest grace and freshness; that of the Venusberg, I think, is again a little too vague in its most critical enchantments, and upon the whole falls perhaps into something of tediousness and surfeit. The intervening three-stanza lyrics of December, January, and February, are as full as their predecessors of tender and various pathos; and so the whole delightful book comes to an end, and leaves all readers the richer for itself.

Sidney Colvin.

Canti popolari siciliani, raccolti ed illustrati da Giuseppe Pitrè. Preceduti da uno studio critico dello stesso autore. Volume primo. Palermo, 1870.

The author and editor of the volume before us has already won an honourable name by various works upon the language and literature of his native island, but his most important work is a series of studies on Sicilian proverbs and popular songs. The last of these, namely the songs, have already been collected by other accomplished Sicilians, such as L. Vigo, in the *Canti popolari siciliani*, Catania, 1857; and S. Salomone-Marino, *Canti popolari siciliani in aggiunta a quelli del Vigo*, Palermo, 1867; and here we have in addition to the 1300 songs of the first, and the 750 of the last, not only a new collection of about 1000 hitherto unpublished poems, but also a reprint, with corrections and additions, of an essay on Sicilian poetry, published some years ago, in which Pitrè fully discussed its nature and spirit, as well as its many points of scientific interest. He devotes a separate section to its various forms, of which the *canzuna* is the most widely spread, and corresponds to the Tuscan *rispetto;* almost all the pieces here published, and collected from different parts of Sicily, belong to this class. They consist of stanzas of eight eleven-syllabled lines, with only two alternate rhymes, which is the main point of difference between the *canzuna* and the common *ottava rima*. Sometimes, however, instead of eight lines, we find six and four, or as many as ten and twelve, but still with only two rhymes or assonances, not unfrequently the latter. As a specimen of the Sicilian dialect, which, however, varies much in the different districts, we may give the following *canzuna*, the first of those from Borgetto, in the province of Palermo:—

"Quannu nascisti tu, stidda lucenti,
'N terra calaru tri ancili santi;
Vinniru li Tri Re di l' Orienti,
Purtannu cosi d' oru e di brillanti;
Tri aculi vularu prestamenti
Dannu la nova a punenti e a livanti;
Bedda, li to' billizzi su' putenti!
Avi nov' anni chi ti sugnu amanti."

"When you were born, O star of shining light!
Down to the earth three holy angels flew;
And carrying store of gold and jewels bright,
There came out of the east three kings to you.
From heaven three eagles came with rapid flight,
To bear to east and west the tidings new.
Beauty! thy beauties are most full of might:
These nine years long I've been thy lover true."

Besides the *canzuna* we have *ciuri* or "Flowers" (the Tuscan *stornelli*), consisting of one five-syllabled and one or two eleven-syllabled lines, in the first of which a flower is named; *arii* or *arietti*, longer or shorter stanzas of seven- and eight-syllabled lines, *diesilli*, laments for the dead, which take their name from the well-known hymn *Dies iræ, dies illa*, &c. &c.

After describing the form in which these songs express different human feelings and passions, amongst which love naturally takes a foremost place, though religion and satire are not forgotten, Pitrè proceeds to point out the historical allusions and reminiscences in which the poems abound, and their use to students of the manners and customs of Sicily, and especially of the history of civilisation in that island. In this connection the following passage is characteristic of the religious state of Sicily, though no doubt the same might be said of other parts of Italy.

"Their religious songs," according to Pitrè, "certainly express the praises of God, the Creator of the universe, but far less warmly than those of the Virgin Mary, the Desire (*sospiro*) of every heart. In praising her whom no human tongue can describe or celebrate aright, the theological *Hyperdulia* changes into *Latria*. Moreover, each locality exalts its own patron-saint to the skies, and ranks him higher than the guardian of the neighbouring village; and these praises often go so far that God Himself has to make way, if, indeed, He is not placed lower still, after the souls in purgatory and the executed (*corpi decollati*), who are the objects of a veneration bordering on idolatry. Indeed the poet is sometimes so far carried away by misplaced religious zeal as to introduce the monsters of human society into the company of the saints and the blessed."

As an instance of this, Pitrè relates how the inhabitants of Paceco, in the province of Trapani, attribute a singular virtue to the grave of an executed matricide, Francesco Frustari (which happens to be placed in a church dedicated to Saint Francis of Paola), and go there to pray and seek special boons.

The last section of the introduction, a comprehensive treatise of 170 pages, is devoted to the peculiarities of popular poetry in the remaining provinces of Italy; this is followed by a careful bibliographical notice of all the studies, collections, and translations of Italian popular songs which have appeared in Italy or elsewhere. Pitrè's own collection contains in twenty-one parts the grounds of the views maintained in his essay, which are naturally also supported by Vigo's and Salomone-Marino's publications. As a second specimen of the *canzuna* we give the following, because Vigo considers it one of the oldest extant, placing it as early as the year 1000:—

"Bedda, chi aviti picciulu lu peri,
D' oru e d' argentu la scarpa v' hê fari;
Si vi scarisci Gran Conti Ruggeri
Di ssu piduzzu s' avi a 'nnamurari:
Pigghiatimi lu 'ncensu e lu 'ncenseri,
Mintitimi la bedda 'nta un artari;
Nenti fazzu pri tia, mè duci beni,
Comu 'na santa ti vogghiu adurari."

"Maid, whose little foot I'd cover
With a little shoe of gold,
Great Count Roger were your lover
If those feet he might behold.
Nay, let incense burn before thee;
On the altar set my love;
Love's too little; I'll adore thee
Like a saint in heaven above."

Here, again, is a *ciuri*, which seems, as Pitrè remarks, to contain a proverbial expression, but the play on the words is untranslateable.

"Ciuri di fenu.
Mentri chi semu Papa papiamu,
Cu' sa si 'n, autra vota papa semu."

"Flower of the hay! While we are Pope, let us enjoy ourselves; who knows if we may be Pope another time!"

From the above examples it will be sufficiently plain that the Sicilian dialect is not easy to understand, and requires very careful study, for which a special vocabulary is almost indispensable. Of these there are several, and a new one by Antonio Traina is just appearing. The notes appended to Pitrè's collection seem only intended for the use of Sicilians, and in the case of linguistic difficulties do not therefore go as far as a foreigner might often desire; but they give considerable assistance, and the illustrative notes are always amusing or instructive. Amongst other legends Pitrè tells the following: A Sicilian lady had died at Constantinople, and her lover, who did not know how to perpetuate her memory and soothe his own devouring grief, caused her skin to be made into parchment, upon which he wrote the thoughts and sentiments she inspired; he prepared her eyes, and preserved them as shining mirrors; he made the bones of her arms and legs into a seat, her hair into a necktie, and her skull into a drinking vessel. The last detail of course refers to a very widely spread custom, for which see, *inter alia*, Grimm, *Gesch. der deutsch. Spr.* p. 143. But though our quotations testify to the varied excellence of the work before us, it cannot be denied that, like other Sicilian collections, it contains a considerable number of pieces of only local interest. As these are for the most part lyrical poems, consisting generally of a single stanza, we learn with satisfaction from Pitrè's preface that his second volume will contain a larger proportion of narrative verse, both legends (*orazioni*) and ballads (*storie*), which will afford various parallels to the similar compositions of other nations, besides containing much that is entirely new; at least so we gather from different indications, which lead us to look impatiently for the promised continuation. Felix Liebrecht.

THE GIOTTO PORTRAIT OF DANTE.

TO THE EDITOR OF *THE ACADEMY.*

56, *Euston Square, N.W., 6th Dec.* 1870.

Sir,—On seeing, in your paper of the 22nd October last, a statement that "Signor Milanesi has already assigned the portrait of Dante, known as Giotto's, to Bernardo Daddi, whom he also identifies with a 'Bernardo of Florence,'" I made mention of this matter in writing to the Barone Kirkup, in Florence, the venerable discoverer of the portrait in question. Many of your readers will remember that this likeness is painted on a wall in the chapel of the Bargello of Florence; and had been totally lost for centuries, until rediscovered thirty years ago, mainly owing to the exertions of the Barone (then Mr. Seymour) Kirkup. In reply the Barone has sent me a few details, which appear to me interesting, both in themselves and on account of the general subject; and, as he says "You may make any use of these facts and of my name," I beg to lay them before you and your readers.—Your faithful servant,

W. M. Rossetti.

"Signor Milanesi is an under-librarian in Siena. He proclaimed the *real* likeness of Dante to be a bad drawing in a MS. of the Quattrocento, in the Riccardian Library; very ugly and old, taken from the mask badly—beneath criticism. A shield with the arms of the Podestà Fieschi, who was Podestà in 1358, is painted at the foot of the group by Giotto, who died in 1336; *ergo* he was not the painter. But it was found that the shield was in tempera, and had partly peeled off the fresco: so *that* mare's nest failed. They then found another equal to it. In a dark part of the chapel, between the two small windows, is a small figure of two or three feet; Giotto's are all life-size or more (see the print of the tracing of the face of Dante, published by the Arundel

Society). This little figure is of Saint Venanzio, patron of the city of Camerino, and under it is this inscription: 'Hoc opus factum fuit TPR POTĀRIE [tempore potestariæ] magnifici et potentis militis domini Fidesmini de Varano civis Camerinensis hō potes . . . [honorabilis potestatis].' I find that he was Podestà in 1337, the year after Giotto's death; and *therefore* the whole chapel could not be the work of Giotto, as 'hoc opus' must mean 'hæc capella'! Now, as they had no clue, they sought for the name of some one to whom to attribute these magnificent and extensive paintings (of which the great altar is the chief part, and of which there is a print in Lord Vernon's *Inferno*). They pitched on the name of an obscure painter, of whom almost nobody has heard—a poor hand, if he painted this little San Venanzio; and, as Signor Milanesi has committed himself against Giotto, he has found out that Dante's portrait could not have been allowed to appear there until after the sentence of banishment had been cancelled, many years afterwards, in favour of his descendants. Milanesi forgot that the portrait is *young*, and was painted *before* Dante's banishment in 1302. As for his judging of the fresco, I question whether he ever saw it; as it is now thirty years since the genuine original was blotted out by that horrible daub which now conceals it. The original was visible only for about six months after its discovery, when Milanesi was in Siena, I suppose—that is, in 1840.

"This is but one of the memorials of Dante of which I have seen the injury or destruction—the front of his house, his bench ('il sasso'), the portrait in the Duomo, the tomb of his general in the battle of Campaldino, his villa, his busts, &c.! I have urged three ministers and three secretaries-general to save them. Nothing but promises! Florence is sadly indifferent—truly *mater parvi amoris*.

"Milanesi's random guess is opposed to the testimony of Filippo Villani, Giannozzo Mannetti, the editor of Filelfo, Landino, Alberti, Vasari, &c., and the beauty of the portrait, and its fine style.

"Seymour Kirkup."

'THE COURT OF LOVE' AND CHAUCER.

TO THE EDITOR OF *THE ACADEMY*.

Sir,—Being very unwilling that the *Academy* should be held to support the most doubtful doctrine of its last number, p. 34, col. 2, that *The Court of Love* is Chaucer's, I ask space to say that only one MS. of the work is known to us—and that does not ascribe the poem to Chaucer—and that there is no external evidence whatever in favour of the genuineness of the poem, except old Stowe's having put it into his edition of Chaucer's (and other people's) works in 1561. This evidence may be safely held worthless.

The internal evidence, I venture to declare, is dead against the genuineness of the poem. For, setting aside the rime-test, we have the writer, when apologising for his poor verses—and poor they really are—saying—

> "Poemys of Virgile taken here no note,
> *Ne crafte of* Galfride *may not here sojorne*."

That the man here refers to his great predecessor, Chaucer, is quite possible, as another successor calls him, "fader Chaucer, maister Galfryde" (Caxton's *Book of Curtesye*,* ed. Furnivall, 1868, p. 35). It is true that one modern edition, at least in the first passage quoted, has followed Speght's stupid error of making Galfryde, in the second quotation, to be Geoffrey of Vinesauf, to whom Chaucer refers in *The Nun's Priest's Tale;* but there is no evidence that Vinesauf held the rank of a great poet in England in the 15th century. Further, the phrases and words of the poem, like "a *figge* for all her chastité" (l. 685), "religiosité" (686), "metricienis" (30), &c. &c., and the run of the verse, show the work to be after Chaucer's time. Mr. Waring's assertion that "its appended stanzas are entirely Chaucerian, not only in their exquisite rhythm and felicitous expression," &c. &c. I venture to compare with the Comte de Chatelain's calling *The Tale of Beryn* "this gem of Chaucer's Tales," and with the dictum of those who declare this Envoye of *The Cuckoo and the Nightingale* to be, with the poem, Chaucer's:—

> "Aurore of gladnesse, and day of lustynesse,
> Lucerne a nyght with hevenly influence
> Enlumyned, rote of beauté and goodenesse,
> *Suspiries which I effunde in silence!*
> Of grace, I beseche alegge let your writynge,
> Now of al goode, syth ye be beste lyvynge."

* We have a MS. of this, printed in F.'s edition of about 1460 A.D.

It is just as possible that Chaucer wrote the italicised line as that he wrote *John Gilpin*, or Tupper.

If, too, the following lines from those at the end of *The Court of Love* are "in exquisite rhythm and felicitous expression"—

> "Then seide the fawcon, owre owen hartis welth,
> *Domine Dominus noster*, I wot,
> Ye be the God that done us brenne thus hote"—

then the sooner we give up calling Chaucer a poet, the better.

17th Nov. 1870. F. J. Furnivall.

Sir,—Mr. Furnivall, in the *Athenæum*, May 1, 1869, p. 606, writes respecting *The Court of Love and other poems* thus:—"At my suggestion Mr. Morris, when preparing his edition of *Chaucer's Poetical Works*, went up to Cambridge and saw Mr. Bradshaw, who told him his views as to the works he held to be spurious, besides much other Chaucerian matter. On Mr. M.'s return he and I both thought it better to wait till Mr. Bradshaw had printed his reasons and proofs for considering the above-named works as spurious, so that we could test his arguments fully, and that meanwhile Mr. Morris should print the poetical ones as genuine, though I believe I urged mention of Mr. Bradshaw's opinion, but Mr. Morris decided not to raise the question then." Mr. Bradshaw not having yet published his arguments, the evidence remains in precisely the same state as at the date of this paragraph. I hold the *Academy*, therefore, to be in no way compromised by the opinion on the *Court of Love* expressed by me—an opinion given under the distinct reserve, "until more conclusive evidence can be brought," &c., and based entirely on internal proof, which I believe to be afforded by that poem. Before answering Mr. Furnivall's objections, I must premise that the main argument against its genuineness, raised by Herr ten Brink and others, is that they find in it rhymes and words which are not Chaucer's. And I say that I find in this poem Chaucer himself, through each and every one of his characteristics, ranging from his powers of picturesque description and pathos, down to his familiar trick of banter.

Mr. Furnivall's objections are as follows:—(1) Want of external evidence. Stowe and the other early editors were not critical, but whatever weight can be accorded to traditional evidence is on their side; consequently, each piece accepted by them claims a right to close examination from every point of view, before modern criticism reverses their judgment. The MS. R. III. 20, Trin. Coll. Cambridge, of the *Court of Love*, from which Mr. Morris printed in 1866, offers some better readings and a more archaic orthography than the text of Bell's edition, 1855. Mr. Morris does not describe the MS., but Mr. Furnivall assigns its date at "about 1450, perhaps earlier."

(2) Certain words and phrases. This question involves too much detail for present discussion. I freely admit that the *Court of Love* presents a few expressions which seem foreign to Chaucer's English. But the objector must be prepared to show that these are absolutely incompatible with the state of the English language in Chaucer's time, and also, even if this point can be proved, that they are home-grown in the text, and not grafted upon it by the scribes.*

(3) *Galfride.*—Caxton's words prove that Chaucer, like other Geoffreys in Early English literature, was called Galfride; that they identify him with the Galfride of the *Court of Love* is anything but clear. Fifteenth-century versifiers, if I am not mistaken, commonly rank our poet, not with the ancients, but with Gower and Lydgate. But the passage in the *Court of Love* specifies Cicero's rhetoric, Virgil's poetic faculty, and "crafte of Galfride;" Tyrwhitt † and Bell therefore both conclude that the writer here meant was Geoffrey de Vinsauf, who, as the author of the *Nova Poetria*, was in Chaucer's time *a high authority on the art of poetry*.‡ Where is the evidence of this?

(4) The *Court of Love* not Chaucerian either in style or merit.—Tyrwhitt, whose judgment is to be respected, pronounces on it, "I am induced by the internal evidence to consider it one of Chaucer's genuine productions." I may add that a man of Tyrwhitt's acknowledged taste and acuteness would perhaps hardly say so much for the tentative efforts of some modern writers; *e. g.* for Balzac's early novels as compared with his masterpieces; for Wordsworth's *Idiot Boy* judged by the *Ode to Immortality*. Both the merits and defects of the *Court of Love*

* For the reckless havoc bad taste was making at the close of the 13th century in Chaucer's text, see Skelton's indignant protest, *P. Sparrow*, l. 788 *et seqq.*

† *Gloss.* Tyr. s. *v.*

‡ Wright, *Bibl. Brit. Lit.*, A. N. period, p. 398. Also note the style of the ironical apostrophe in the *Nun's Priest's Tale*—

"O Ganfride, dere maister souverain," &c.

appear to stamp it as the production of a young poet working under peculiar difficulties, and also under influences alien to his true nature. Weakness, bad taste, and the tokens of unfledged genius; verbal coarseness and high moral feeling, "poor verses" yet such verse as this—

"Sorrow and thought, they sitte me wonder nigh;

all such incongruous elements meet in this strange poem. And the same inequality of course characterises its appended episode, the *Birdmatins*.* Thus the stanza from which Mr. Furnivall has quoted runs:—

"The egle sang, '*Venite*, bodies all,
And let us joy to love that is our health;'
And to the desks anon they gan to fall,
And who came late he pressed in by stealth;
Than sayed the faucon, 'Our own hertes wealth,
Domine Dominus noster, I wote,
Ye be the God that done us brenne thus hote.'"

Nothing can be worse than the quality of the closing lines. But mark the Chaucerian skill of the couplet, which saves all undue expense of detail by setting at one stroke the crowded choir full in the reader's eye. For our poet, be he who he may, is no mere plagiarist from the *Assembly of Fowls*. In each composition the artist presents a distinct and clearly defined picture; in the one that of a congregation, in the other that of a choir. Again, to understand the value of that selection and concentration which mark off this trifle from post-Chaucerian pieces kindred in subject, we have but to compare it with compositions, in themselves not without merit, as the *Harmony of Birds* or better, perhaps, the Dirge in *P. Sparrow*. Contrast the languid effect produced upon the mind by Skelton's ornithological muster-roll with the lively presentment to the fancy called up by the poet in whom were the growing elements of dramatic power. And now let us set two consecutive stanzas by the side of Mr. Furnivall's spurious (and moveable) Envoy,† as he suggests, the handiwork of some fifteenth-century Tupper.

"'*Te Deum amoris*' sang the throstel cocke;
Tuball‡ himselfe, the first musician
With key of armony coude not onlocke,
So sweté tewne as that the throstel can.
'The Lorde of Love we praysen,' quod he than,
And so done al the foules, great and lite
'Honour we May in fals lovers dispite.'

'*Dominus regnavit*,' said the peacocke there,
The Lord of Love, that mighty prince ywis,
He is received here and every where;
Now *Jubilate* sing;'—'What meaneth this?'
Said then the linet; 'Welcome lord of blisse.
Out sterte the owle with, *Benedicite!*
What meaneth all this merry fare?' quod he.§

Juxtaposition will not, I think, bring out a strong family likeness between the Envoy and the above lines. In our curious bit of painting *en genre*, the work from first to last is made up of realistic, yet subtle touches, each individualising an accessory, and bringing, at the same time, life and colour into the picture as a whole. As, *inter alia*, the storm-cock's invective, the parrot's verse, the magpie's iteration of the choral amen, the natural action of the wren and robin, the line which emphasises the lark's shrillness, the kite's cry, and also renews the impression of a full choir. I repeat that I am quite prepared to give up the *Court of Love* as an early Chaucer poem whenever conclusive proof shall be brought forward of its spuriousness. But, in the present state of the evidence, it is no literary heresy to hold that the "man" who wrote it may be none other than "A MAN of great auctoritee."—*H. of Fame*, b. 3, l. 1068.

One word more. The question, which has here been scarcely touched, whether certain poems shall or shall not hereafter count as works of Chaucer is in reality an important literary problem. The solution is at present in the hands of our best Early English scholars, but it equally claims the attention of our best poets, and the care of our most accomplished critics.

GEORGE WARING.

* In accordance with mediæval taste, a choir of birds sing matins to the God of Love. The initial verses of Psalms, &c., are all taken from the Breviary Office for Trinity Sunday.

† In MS. Bodl. 638 of *Cuckoo and Nightingale*, the Ballad and Envoy do not appear. In MS. Fairfax, 16, they are not appended to its copy of that poem, but to the *Book of the Duchess*.

‡ See *B. of Duchess*, l. 1161.

§ The initial word of the Canticle serves as an exclamation for the owl. The quotations are from Tyrwhitt's edition.

Intelligence.

The re-arrangement of the Parthenon friezes in regular sequence—the lacunæ among the marble fragments in British possession being so far as possible filled up with casts of such as exist elsewhere—is now approaching completion in the enlarged Elgin room of the British Museum. In the adjoining room also the remains from the tomb of Mausolus, together with a few analogous remains from the temple of Athene Polias at Priene, are finally set up. Fragments of the nave and the axle-box have given the measure for a complete restoration of a wheel of the *quadriga lenta* which surmounted the mausoleum; and this wheel is placed in relation with the superb fragments of equine sculpture—including the complete fore and hind quarters of two separate horses—found in the same place. The colossal female figure, broken in two at the knees and mutilated in the face and forearms, which is supposed to have stood as chariot-driver beside that of Mausolus, has been set up, with a reparation of the lost portions about the knees, such as seems not quite satisfactory. Side by side with this has been just placed the cast of a complete conjectural restoration of the same figure, for which the nation is indebted to the zeal and generosity of Mr. W. W. Story. The knees are here spread wider than in the repaired original, with the clear advantage of a firmer plant for the figure and a more expressive junction and carrying out of the original draperies. The straight fold descending from the left hip seems also to take its place with great felicity; the driving action of the fore arms and hands commends itself again; but it may be doubted whether Mr. Story has not Romanised unduly in the character of his head, and whether the single folds of the stola falling towards either shoulder have not undue heaviness.

The forthcoming exhibition of Old Masters at the Royal Academy promises to be not less admirable than the last. In addition to further selections which it is hoped to obtain from the collection of the Queen, the Marquis of Bute and Mr. T. Baring have again offered contributions; the gallery of Lord Dudley has been placed at disposal without reserve; so have those of Lord Ashburton and the Dowager Lady Ashburton; and besides these and others, the collection of Mr. Wynn Ellis supplies a rare choice of the Dutch and Flemish masters.

Mr. Millais has for the first time painted a picture in the class of landscape proper—a large study of a scene in Perthshire. He has also advanced with the Biblical subject of Aaron and Hur staying up the arms of Moses at the battle with the Amalekites.

Mr. Poynter has in hand the subject of Atalanta's race, besides a pair of decorative designs of fruit-gatherers, the one of two male and the other of two female figures.

The recent enlargement of the gallery of pottery and porcelain at South Kensington coincides with the announcement of a history of those arts by Mr. William Chaffers, to be published in six elaborately illustrated monthly parts, under the title of "The Keramic Gallery."

De Gids for December contains an able critique on Julian Schmidt's Pictures from the Intellectual Life of our Time, which lately formed the subject of an interesting essay in the Contemporary. The literary merits of the work are amply recognised. The author is a German Taine; his style has a brilliancy and precision which can only have been derived from a French source, just as M. Taine's predilection for the classification of phenomena under fixed formulæ can only be explained by his profound German studies. But as an attempt to prove the beneficial action of the Prussian State on German literature, the Dutch critic pronounces the work less successful. The forces which influence the development of literature are for the most part to be sought in the sphere of literature itself. Virgil and the Provençal poets have a larger share in the origin of the Divina Commedia than the political events of Dante's own time, and probably the plays of Shakspeare have had fully as much influence on German literature as the campaigns of Frederick the Great.

The Excavations at Cevetri.—W. Helbig gives in the *Grenzboten* of Oct. 21 an account of the terra-cottas discovered in the neighbourhood of the ancient Caere, which have been acquired for the Berlin Museum. The first excavations resulted in the discovery of a square room, hewed out of the solid tufa, and filled with terra-cotta fragments of all ages and descriptions. W. Helbig supposes the cavity to have been intended for a rain-water tank, and that the remains found in it were thrown in at the date of the latest, as pieces of all periods are mixed together. Many of the tiles are ornamented with female heads, showing Asiatic influence, and having most affinity with Hellenic work of the time of Alexander. The other terra-cottas are distinguished by differences of style, especially of colour, the earliest using few tints, of which yellow ochre is the prevailing one. To this period belongs one of the pieces at Berlin, an earthen mural covering, painted with two figures, a man and a woman with joined hands and a bird hovering between them, the latter of the much discussed egg-form. Some plates, with chariots and horsemen finished in relief, are the earliest of the kind yet discovered; the ground is yellow ochre, the figures alternately reddish and greenish grey. One group, about three feet high, has evidently served to finish the point of a gable; the composition is primitive, the

upper part of the female figure being taken in front and the legs in profile. The later polychromous tendency is represented in a series of colossal akroteria, heads of women, fauns and satyrs forming the centre of each, with ornamentation of lotus flowers, &c., corresponding in style to the freest period of Hellenic art; some brilliantly coloured designs are evidently modelled on Greek bronze-work. The fragments show that what may be called the terra-cotta style of architecture lasted in Rome till the 2nd century B.C.; and Helbig conjectures that the custom of illumination may have been introduced as early as that time, for some of the akroteria are perforated and furnished with spikes in a way that could serve no other purpose but that of supporting candles. The excavations are still proceeding.

The Marseillaise.—In a German volume called *Zwanzig vaterländische Gedichte*, F. M. K. asserts that the music of the Marseillaise is stolen from an old German air, which the writer has heard sung in Bavaria in 1842 by an old peasant woman, who had learnt it from her mother and grandmother. A German ballad, beginning "Stand ich auf hohen Bergen," was set to it. This is not very new. It has long been known that the melody of the great French war-song existed in the archives of the cathedral of Salzburg, and was played there as a chorale in the last century. But for all that Rouget de l'Isle's claims to the authorship of the Marseillaise melody would remain the same even if he had got the first impulse to it from the German tune. In music we find many examples of great men recreating existing melodies. So the theme of the chorus in Beethoven's ninth symphony occurs in an accompaniment to a sacred chorus of Mozart; and this same composer took as theme for the prayer, in the overture of the "Flauto Magico," a melody which is to be found in Clementi's sonata in *b* flat.

Gustav Freytag, the well-known novelist and litterateur, announces in one of the last numbers of the *Grenzboten* that he has retired from the editorship of this periodical, in consequence of an attempt on the part of his publisher to introduce his own religious opinions into the paper. Gustav Freytag is considered, besides his great name as a novel writer, one of the best journalists of the national-liberal party, and we have no doubt that the new organ, *Im neuen Reich*, which he has started, will have all the sympathies of this party and its friends. We heartily congratulate Herr Freytag on his firmness in this matter, and hope that his new periodical may prove a success "in the new Empire."

Hungarian Popular Poetry.—We are informed from Pesth that there is a prospect of the long promised collection of Magyar popular poetry and stories being at last published. In the years 1846–48 M. John Erdélyi published three volumes of popular songs and stories entitled *Népdalok és mondák*, under the auspices of the Kisfaludy Society. There the matter rested until 1860, when M. Paul Gyulai, a member of that society, urged the publication of a more complete collection. He was accordingly entrusted with the work of editing the additional materials which had been collected; and in 1867 M. Ladislas Arany, son of the well-known poet, was associated with M. Gyulai as editor of the prose portion of the work. In the meantime (1864) M. Kriza, superintendent of the Unitarian church in Transylvania, published one volume of a collection of songs, tales, proverbs, &c., in the peculiar dialect of the Székels (E. of Transylvania), entitled *Székely vad Rózsák* (Székel Wild Roses). The second volume of this has not appeared. A large quantity of materials had been got together by various collectors, but the great difficulty was to find a publisher. At last in 1869 the *Athenäum*, a joint-stock publishing society, agreed to publish two volumes of 30 sheets each, which are presently to appear. The second volume contains M. Charles Török's collection of the popular songs of the *Alföld* or Great Hungarian Lowland. The first volume contains a selection from the materials of various collectors, divided under four heads: 1. Christmas and Twelfth Night Pieces. 2. Ballads. 3. Songs, and 4. Tales. A leading principle adopted by the editors is to insert only important variations from the versions given in the collections of MM. Erdélyi and Kriza, or pieces wholly omitted by them. In a meeting of the Kisfaludy Society, M. Gyulai pointed out the two great defects of the collections (including that about to be published)—that in but few instances the melodies are given with the words of the songs, and that neither the songs nor the tales are given in all cases in the dialect of the locality in which they were collected. In the few cases in which this has been done, the dialectical peculiarities have not been so accurately rendered as were to be desired.

An American Professor is publishing in the Williams Review, the organ of his university, the college exercises of Hawthorne and Longfellow, and other distinguished men which have remained in his hands.

An (incomplete) autobiography of Lamartine is to appear in Paris when circumstances become more favourable to such enterprises.

We are sorry to have to stigmatise Sir Digby Wyatt's *Lectures on Fine Art*, just published, as thoroughly unscholarly. The style is difficult, and the theory vague or obsolete. We have names named and little told about them, many authorities mentioned, particularly such as are bad or exploded, and the subject left without real illumination in any of its parts. Any reader moderately acquainted with Greek art may, by turning to p. 130, discover a perfect nest of blunders.

Selected Articles.

Byron; by John Morley. [Directed to the estimate of his works in their political significance: Byron the poet of the Revolution for Europe at large: his concern with practical and immediate movements contrasted with the abstract humanitarianism of Shelley.]—Fortnightly Rev. for Dec.

Hand and Soul, by D. G. Rossetti. [A short and vivid tale or romance of an imaginary mediæval painter of Pisa making a picture of his own soul, which comes to him in the likeness of a woman. Originally published in the "Germ," an early organ of the pre-Raphaelite movement. From a note in his *Early Italian Poets*, we know that the author had never been in Italy. Conceived with a most striking quality of humour as well as poetry.]—The same.

More Roba di Roma: Castle St. Angelo; part i.—Blackwood's Mag. for December.

On Progress, by the Editor in Fraser for Dec. [Very striking. See criticism in Sat. Rev. Dec. 10.]

On the Theory of the Human Soul, by Rev. J. B. Dalgairns, in the Contemporary. [The Soul is the seat of the force which constitutes the Body: a non-existent or hypothetical mind points a non-existent or hypothetical world.]

On Infinity, by Rev. F. Garden.—Same. [An acute endeavour to discard the conception.]

Franco Sacchetti. By Raffaello Fornaciari. [A review of recent reprints of Sacchetti's writings in prose and verse. His satirical poems are blunt and vigorous, but less known than his *ballate* (of which the one beginning

"Passando con pensier per un boschetto"

has been well translated into English). His *novelle* had a still wider popularity, being written in the lively idiomatic Florentine of Cellini's life; they resemble the more realistic stories of the Decameron, and their humour is to the full as broad as is desirable.]—Nuova Antologia, October.

Profili di Scrittori Italiani viventi. By L. Morandi. [A short notice of the poems of Enotrio Romano (Giosue Carducci), a young government employé, who gets into trouble with his superiors for dedicating verses to Mazzini, and has written an eloquent "Hymn to Satan." Baudelaire and Swinburne are the writers with whom he has most affinity.]—Rivista Europea, November.

Alcune Questioni di Poesia popolare. By Giuseppe Pitrè.—[Argues that popular songs are always composed at the time of the occurrences to which they allude. The author found a poem in MS. dated 1666, and on quoting it to a blind woman who was his principal authority, she was able to continue it correctly. His opinion is also supported by the fact that the Sicilians have already composed popular verses on the introduction of paper money (1866), of railways (1863), the campaign of Mentana (1867), Garibaldi and his Thousand (1860), and such trifles as a new municipal form of hearse (1868).]—The same.

New Publications.

Theology.

Fragmenta Evangelica, quae ex antiqua Recensione Versionis Syriacae Novi Testamenti (Peshito dictae) a Gul. Curetono vulgata sunt, Graece reddita, etc. Pars Prima, Curante J. R. Crowfoot, S.T.B., Coll. Gonv.-Cai. Cantab. olim Socio. Cambridge University Press, 1870.

When Dr. Cureton published in 1858 his *Remains of a very antient Recension of the Four Gospels in Syriac*, the critical value of the publication was very sharply contested. Dr. Cureton himself claimed for it no less than that it "to a great extent retained the identical terms and expressions which the Apostle St. Matthew himself employed (p. xciii);" and though this claim has not been substantiated, still both Tregelles and Tischendorf concede to it an antiquity greater than that of even the Peshito text (in its present form). Its antiquity is in fact rendered certain not only by the date of the MS., about the middle of the 5th century, but also by its being quoted in several places, though not constantly, by Aphraates, whose remains have lately been edited in Syriac by Dr. Wright (see *Academy*, vol. i. p. 54), and whose Homilies were composed partly in A.D. 337, and the rest in A.D. 344. The very title, rendered erroneously by Cureton, "The *distinct* Gospel of Matthew," has also been discovered in the Lexicon of the famous Nestorian physician Bar-Bahlul, who flourished at the court of the Abassidae, at Bagdad, about A.D. 960. He mentions a different reading as given by this version in Mat. xxvii. 17; and as Ignatius, patriarch of the Jacobites, also describes a copy which he was obliged to sell in A.D. 1396, to procure means for repairing his monastery, which had been devastated by Tamerlane (see *Assem. Bibl. Or.* ii. 230), we have proof that it was recognized as an independent, though possibly obscure, version of the Gospels by the Syrians themselves.

The value of a version certainly in existence in A.D. 337 is evident. Thrust aside by the Peshito, it was not so liable as that popular version to the mistaken emendations of scribes based upon a later Greek text. As therefore the Curetonian fragments represent a text older than that even of the Sinaitic MS., Mr. Crowfoot has set himself to a work of manifest utility in endeavouring to give us their Greek equivalent. At the same time he has had to encounter difficulties of no ordinary extent, for the older the translation the looser and more periphrastic its method. The older translators were very indifferent to verbal accuracy, and allowed themselves great licence in adding or altering words, if thereby they could bring out the meaning of a passage more distinctly. The Peshito itself constantly paraphrases, and gives us the sense rather than the words: and, to speak plainly, if the Curetonian had not been a bad translation, it would not have been so easily thrust aside by the Peshito. For even the latter, precious as it is in many ways, is so inaccurate that the Syrians themselves regarded it with great dissatisfaction. As early as A.D. 508, Philoxenus, bishop of Mabug, published a more literal version of the Greek; and just a century later Thomas, bishop of Hharkleia, collated this version with the best Greek MSS. then extant at Alexandria, and corrected in it whatever was amiss. Henceforward this became the translation current in the Syrian Church, and Bar-Hebraeus often contrasts its accuracy with the looseness and negligence of the Peshito. This is the work edited by Dr. White in 1778 for the delegates of the Clarendon Press at Oxford, and which is usually quoted as the Philoxenian because so described by its editor in the title page. The accurate Tregelles gives it its proper name.

Intensely literal, sacrificing everywhere the Syriac idiom to verbal accuracy, and even then constantly compelled to write the Greek word in the margin in Syriac characters, the Hharkleian version is capable of being reproduced in Greek. In attempting this feat for the Curetonian fragments, we cannot but think that Mr. Crowfoot was undertaking an impossibility. Where different readings exist in the Greek MSS., there it is generally possible to see which has the support of the Curetonian and Peshito versions: where no such diversity exists, we protest most earnestly against the introduction of new readings from versions confessedly periphrastic. Mr. Crowfoot set himself to a labour which involved at every step the decision between what was possibly a new reading, and what was an error of the translator; and we can nowher- see any indication that he was aware that his whole work was vitiated by his erroneous conception of the nature of the materials with which he had to deal. At the cost of infinite pains, he has produced, not a work that will benefit the critic, but a curiosity only.

But, further, Mr. Crowfoot's Greek is not an accurate representation of the Syriac original. We had marked many crucial texts where his Greek would lead the critic astray. Upon the whole, however, it has seemed best to take unimportant passages, as involving no theological bias. The opening words, then, Mat. i. 1, ἡ βίβλος γενεσέων (a reading supported by no Greek MS.), involve two serious mistakes. First as regards the article. Mr. Crowfoot, we presume, has added it because the word for *book* in the Syriac is in the emphatic form. But had he studied the Hharkleian version, which does try to mark the presence of the article, he would have found that it does not do so by the use of the emphatic and absolute forms. Besides this, the presence or omission of the article is a nicety dependent almost more than anything else upon the idiom of the language. An article may often be requisite in a translation where there is none in the original. Here, however, the case is otherwise, for the Syriac puts *book* in the emphatic form simply in obedience to a rule of Syriac grammar. And next, as to γενεσέων, we grant readily that the Curetonian word is plural, but it should be remembered that it answers to the Hebrew תולדת (Gen. v. 1, &c. "a genealogy"), and therefore does not involve a plural in the Greek. The Peshito and the Hharkleian actually have a noun in the singular, but the latter of these versions alone gives the precise equivalent for γένεσις; the word in the Peshito means "nativity." But this is not all. We venture to ask on what principle Mr. Crowfoot expresses the pleonastic pronoun in v. 23, ὁ θεὸς ἡμῶν μεθ' ἡμῶν, but omits it in v. 1, where the literal rendering is, "Book of his births of Jesus Christ?" It is well known that this pleonasm of pronouns is the rule in Syriac. The Hharkleian alone among Syriac versions gives us the right reading, "with us God," but by so doing violates the idiom of the language. No Greek MS. has any such reading as ὁ θεὸς ἡμῶν, neither had the MS. employed by the Curetonian translator.

Passing by the genealogy, we come to verse 18, in which Mr. Crowfoot has carelessly omitted Μαρίας. But this slip is a trifle: we have a more serious objection to the new reading he offers us. All the MSS. read πρὶν ἢ συνελθεῖν αὐτούς. The Curetonian literally is, "when they had not

approached one to one," "one" in both places being masculine. We feel sure that "one to one" is nothing more than an awkward attempt at rendering the *σὺν* in *συνελθεῖν*. Mr. Crowfoot extracts from it the impossible reading *ὡς οὐκ ἀλλήλοις προσῆλθον*.

So in verse 20. Every MS. reads "in a dream." So do the Peshito and Hharkleian. The Curetonian has "in a vision of the night." Does this justify Mr. Crowfoot in substituting *ἐν ὁράματι νυκτός* for *κατ' ὄναρ*? To us it is nothing more than a periphrasis, which suggests not the slightest idea of a different reading. We might go on thus verse by verse. Even where the Syriac is a fair rendering of the Greek, we find some extraordinary novelty. Thus "our daily bread" is no longer *ἄρτον ἐπιούσιον*, but *ἄρτον ἐνδελεχῆ τῆς ἡμέρας*.

Before attempting so very difficult a task, we think that Mr. Crowfoot should first have examined into the nature of the Curetonian fragments, to see whether they offered so accurate a translation as to be capable of being literally rendered back into Greek, with any chance of giving us a trustworthy text. Had he been satisfied of this, he should then have studied the Hharkleian version, in which the attempt was confessedly made to give the Syrians an exact equivalent of the best Greek text then to be found. He would thus at all events have made his Greek approach more nearly to the true intent of the Syriac. But the misapprehension of the value of the Curetonian fragments would still have vitiated his labours. What would be the value for textual criticism of a translation of our authorized version back into Hebrew when there are in it twenty-three different Hebrew words rendered by the one English term *Branch*? Yet our version is accuracy itself compared with the looseness of the Curetonian renderings. There are in fact two methods of translation, the one which endeavours to give the sense, the other which aims at literal accuracy. Early translations all belong to the former kind, and even then so constantly wander off into exegesis, and so perpetually substitute what the translator thought "ought to be written" for what is written, that the greatest caution is required in their use. The translation of Onkelos and other Chaldee "Paraphrases," the Septuagint, the old Italic version, and so on, are all most valuable monuments of antiquity; but all require great care in the handling. So in Syriac. The Hharkleian version might be translated back into Greek. It is purposely literal, sacrifices idiom and often sense to verbal accuracy, and has its own awkward methods of representing the article, tenses, compound words, and so on. But neither the Peshito nor the Curetonian admit of this treatment. Mr. Crowfoot would be performing a really useful task if, confining himself to the various readings offered us by the best Greek MSS., he would show which of them have the support of these most ancient versions.

Should he undertake this task, we trust he will dismiss Scholtz' edition of the Greek Testament to the obscurity into which it has long retired. Useful in its day, its day has long passed. Lachmann's would have been the most handy for use, because confining itself to a few ancient texts, or, for the same reason, Hansell's edition of the most ancient texts themselves. For fuller readings, surely, Tregelles and Tischendorf should have been used. After the great activity of modern scholars, and the valuable results in textual criticism at which they have arrived, we cannot understand why all their work should be ignored, and Scholtz reinvested with a now antiquated authority.

R. Payne Smith.

Messias Judæorum, libris eorum paulo ante et paulo post Christum natum conscriptis illustratus. Edidit Ad. Hilgenfeld. Leipzig: Fues, 1869.

What were the characteristics of the Messianic idea current at the Christian era? The question is important in its bearing on the fundamental idea of Christianity, since the various answers returned to it correspond to as many various estimates of the originality of the latter. Ewald, for example, with whom Hilgenfeld, Keim, and the majority of critics agree, supposes Jesus to have found a fully-developed conception of the Messiah already in existence, whilst others, such as Bruno Bauer, Volkmar, and W. Lang, think that the idea of a personal Messiah had been slumbering for centuries, when Christianity recalled it to the consciousness of the age. The interest, but also the difficulty, of the subject has increased owing to the new form which the question has assumed. It has become a controversy as to the date of the great apocalyptic writings of later Judaism. According as we assign the books of Enoch and Ezra (IV. Esdras) to the age before or after Christ, will be our view of the manner in which the title "Son of Man" was applied by Christ. Dr. Hilgenfeld, to whom students of the early Christian period are so deeply indebted, believes that Jesus did but follow the example of the Jewish apocalyptic writers, a view which he maintained with much energy in *Die Jüdische Apokalyptik* (1857), and which can be traced unmistakably in the volume before us. He now presents us with three remarkable and little-known works, all of which, in his opinion, were written between the conquest of Jerusalem by Pompeius and its conquest by Titus, *i.e.* between B.C. 63 and A.D. 70.

The first of these works consists of the so-called Psalms of Solomon, eighteen in number, which stand in much the same relation to the old Hebrew Psalms as the poetical pieces in the 1st chapter of Luke. They were introduced into the West from Constantinople in 1615, and first edited (but incorrectly) by La Cerda (1626) and Fabricius (1713). Hilgenfeld himself maintains the originality of the Greek, while the majority of recent critics (Movers, Dillmann, Ewald, Delitzsch, Langen, Derenbourg), with perhaps more reason, regard it as a translation from the Hebrew. However this may be, the researches of Hilgenfeld as to the date of these Psalms (B.C. 48) are conclusive, *e.g.* when he proves from Psalm ii. the reference to the end of the sacrilegious Pompeius. It is satisfactory to find Volkmar, generally a pronounced opponent of Hilgenfeld, coinciding in this view.

The critical questions relating to "IV. Esdras" are of a much more uncertain nature, as indeed might be expected from its enigmatical contents. The author of this apocalypse is depressed and confused by his consciousness of the strange contrast between Israel's mission and her actual circumstances. It is no small merit to have given the first trustworthy text of such a work, as Dr. Hilgenfeld has done. Not only has he edited the Latin version with greater critical precision than Volkmar (1863), but, through the kindness of three eminent Orientalists (Praetorius, Steiner, Petermann), he has given us accurate renderings of the Arabic, Æthiopic, Armenian and Syriac versions, and these are preceded by a reconstruction of the original Greek text, attempted with the assistance of Professor Lagarde and Dr. Rönsch.

The contents of the book are throughout of an eschatological nature, and remind us, in many points, of similar discourses of Jesus in the synoptic gospels. Hence the question presses for solution, whether the book was written before or after Christ. Volkmar adopts the latter alternative, and supposes that "IV. Esdras" was written under Nerva A.D. 97, a very plausible hypothesis, which has of late been

the favourite one among critics. It must be owned, however, by impartial readers, that the reasons adduced by Dr. Hilgenfeld for a pre-Christian date are of very considerable weight. This, we think, is the case with the very careful researches into the relation of "IV. Esdras" to the writings of the New Testament in a higher degree than with the explanation of the famous Vision of the Eagle. Indeed, even after mastering the long controversy between Hilgenfeld and Volkmar, we are obliged to confess that the events of history must have been reflected in the mind of this unknown writer quite otherwise than they appear in our historical manuals. How else can we account for the utter perplexity of such experienced critics in respect of the century in which the three-headed eagle sets his twelve great and eight small wings in motion? It is not very easy to realize even Hilgenfeld's result, according to which the eagle must have had Roman sympathies in his three heads, and Syrian proclivities in his twenty wings, since, according to our editor, the heads represent Cæsar, Antonius, and Augustus, and the wings the line of the Seleucidæ!

With regard to the sixth Book of Moses, or the Ἀνάληψις Μωυσέως, the results of Hilgenfeld, as opposed to Volkmar, will probably meet with still wider acceptance. Our information respecting it has been until lately confined to a few passages of Origen and Œcumenius, and the acts of the second synod of Nicæa. Ten years ago Ceriani discovered a connected fragment of it in an old Latin translation at Milan, and in the third part of the *Messias Judæorum* the editor has attempted to reconstruct the Greek original. The Latin text had already been published by Hilgenfeld in 1866, by Volkmar in 1867, and by M. Schmidt and Merx in 1868. The theory that this apocalypse was written at Rome A.D. 44 is made by Dr. Hilgenfeld in the highest degree probable. In fact, the last historical personage whose form can be traced in it with certainty is Herod the Great.

We have still to collect the results of Dr. Hilgenfeld's inquiries relative to the Messianic belief of the Jews at the time of Jesus. So much is beyond the shadow of a doubt, that the last two Psalms of Solomon, written before the birth of Christ, sketch the outline of a Messianic ruler, who should subdue the heathen, and afterwards as the Prince of Peace, sinless and holy, should reign over a righteous people of Israel. The chief modification of this portrait introduced in "IV. Esdras" is one that is found also in the Christian apocalypse (that of John), viz. that the Messiah is for the first time placed *before* the great catastrophe, and therefore *before* the final judgment, in a happy time at the end of the present æon. Still more remarkable is the form under which the Messiah appears in this apocalypse. If the pre-Christian origin of the book could be fully established, this would be the most direct evidence of the absence of originality in the Christian Messianic idea. It is impossible to mistake the influence of the book of Daniel, when the Messiah of "IV. Esdras" is made to ascend out of the sea in human form, and thereupon to fly with the clouds of heaven, while the earth quakes, and its inhabitants perish, wherever he turns his countenance. He is further represented as remaining in the highest paradise in company of the translated prophets Enoch, Moses, and Elijah, until at the end of the days he appears on Mount Zion, to kill the besieging hordes with the flames of his mouth, to bring back the ten tribes, and to reign over the elect. But even this description of the Messiah is but transient and occasional, the distinctive name for him in "IV. Esdras" being "Son of God" (comp. xiii. 37, 52, xiv. 9). The combination of all these notions,—Son of God, Son of Man, Pre-existence, and Davidic Birth, is discussed with admirable clearness by Hilgenfeld in p. 103 of the *Messias Judæorum*, and p. 316, &c., of the volume for 1870 of his own periodical. On the other hand, he will certainly be alone in his reference of the "gematrical" number of this apocalypse ϖξγ (ix. 24, comp. the well-known χξϛ Rev. xiii. 18) to the Messiah (p. 467). Without accepting the solution of Volkmar, who interprets this number of Rabbi Akiba, we cannot but agree with that critic in his assertion that the apocalypse of Moses contains no indication of a personal Messiah. For a further development of this important subject the reader may still be referred to a paper on "the Messianic idea at the time of Jesus," in the *Jahrbücher für deutsche Theologie*, 1867, p. 389, &c.

SOME EMENDATIONS IN ISAIAH.

TO THE EDITOR OF *THE ACADEMY*.

Sir,—As far as I am aware, no one has yet offered a tolerable explanation of the words בְּלְתִי כָּרַע תַּחַת אַסִּיר in Isa. x. 4; and no wonder, for the text has been altered. It should, I think, be read, בֵּלְתִי כֹּרַעַת חַת אסיר. Whither are you to flee? "Belthis is sinking, Osiris has been broken;" the idols have been found so utterly worthless, that they are allowed to lie among the bodies of the slain. Belthis is Βῆλθις ἡ Ἥρα ἡ Ἀφροδίτη in Hesychius. Bar Ali explains בלתי by "Aphrodite, the star known by the name of Zuhara;" see Selden's *De diis Syris*, 156; Lagarde's *Gesammelte Abhandlungen*, 16, and his *Analecta*, 137, 22. The ת is softened by the influence of the lost vowel of the preceding consonant (בלתי for בעלתי): comp. the Syriac יָתְבִין = *yâth-bhîn*, and the Hebrew שִׁטְפִים = *shôt-fim*, Isa. xxviii. 2. As for Osiris, we know him to have been worshipped at Byblus (Plutarch on Isis and Osiris, 15, 16); and as Egypt in the time of Isaiah was the natural bulwark of the smaller Asiatic powers against Assyria, it is not unlikely that the principal deity of Egypt should have been known and even adored amongst the Jews. If Jeremiah could mention Apis (xlvi. 15, נָסְחָף = ἔφυγεν ὁ Ἄπις, LXX. = חָף נָם, see Spohn, ii. 321), why should not Isaiah have known Osiris? I have left the א in אסיר without a vowel, as I am not sure which is the right one. Compare the whole passage with the Hebrew of Isa. xlvi. 1, Jer. l. 2.

There seem to be two other faults close to the verse emended. In ix. 16, יְשֻׁמָּח ought to be יְפֻסָּח, and וּמְבַלְּעִים, ver. 19, וּמְנַזְּרִין. The former of these corrections is self-evident. As for the latter, I am convinced that נזר is a root of far too precise a meaning to be employed as a synonym of אכל, while נרז in Arabic is the proper word for eating gluttonously.

Göttingen, Nov. 14, 1870. Paul de Lagarde.

Intelligence.

It does not seem to be generally known that fifteen years before the publication of the great Complutensian Polyglott, the elder Aldus projected a work which would have been an interesting proof of the zeal of the Italian renaissance for Biblical studies. The volume known as the *Astronomici Veteres* (Ven. 1499, fol.) contains a letter addressed to Aldus by one of the most distinguished Hellenists of the age, the Englishman Grocyn. He writes as follows:—"Noster item Linacrus nuntiavit mihi te rem multo magis admirandam moliri, iamque statutum habere ut libros sacros veteris quidem testamenti trifariam, latine, graece et hebraice, Novi autem bifariam graece et latine imprimas, Opus plane arduum et christiano viro dignissimum. In quo, si modo perficere licebit, non modo caeteros omnes, qui unquam in hoc genere floruerunt, sed etiam te ipsum longo intervallo superabis. Age igitur, mi Alde, auspicare tandem opus, quod cogitas, et quod iamdiu parturis, aliquando parias. Non enim adduci possum ut credam, posse opus tam divinum secundis carere successibus."

A small but valuable contribution to the critical study of the Septuagint has been made by Dr. Reusch, a Roman Catholic professor at Bonn, in an academical programme published last August. The object of it is to show that the Greek text of Tobit exists in a threefold recension, represented, 1. By the Vatican and Alexandrine MSS.; 2. By the Sinaitic; and 3. By the cursives numbered 44, 106, 107, &c.

A solid basis for inquiries as to the mutual relation of the various texts of the Masorah will be provided by Dr. Ginsburg's forthcoming work on the Masorah. It will consist of three parts: 1. The Great Masorah in alphabetical order, according to the printed edition, but with greater fulness, and carefully collated with the MSS.; 2. The

Small Masorah, edited entirely from the MSS.; and 3. A kind of Concordance to the texts of the Masorah in the various editions of the Bible. The work is in a forward state of preparation, and will be published on the author's return from the land of Moab, whither he intends to proceed next month.

Contents of the Journals.

The **Theologisches Literaturblatt**, the organ of the R. C. theological faculty at Bonn, is remarkable for the comprehensiveness of its contents and the impartiality of its criticism. The most important articles in the recent numbers are two by Dr. Reusch on works relating to the Old Testament (Nov. 21, Dec. 5), and a still unfinished one by Alfred von Reumont on Dean Hook's Life of Cardinal Pole (Dec. 5). The praise awarded in the former to Bleek's Introduction to the Old Testament, Schulz's Old Testament Theology, and Dillmann's Commentary on Job, and even, with some qualifications, to Hitzig's History of the People of Israel, is a proof of candour which is most encouraging. The latter article is mainly devoted to a narrative of those parts of Pole's life which were inadequately treated in Dean Hook's work. Several *lacunæ* are pointed out in the author's list of authorities; *e.g.* Albin's collection of the despatches of the Venetian envoys, most of the works of Beccadelli, and Ranke's Englische Geschichte, not to mention the stores of manuscripts which, even after Lämmer's publication (neglected by Dean Hook), exist at Rome and elsewhere. Articles by Prof. Langen on some recent books on the Epistles, by Dr. Kössing on Pfannenschmid's Das Weihwasser, and by Michelis on Prantl's "monumental" History of Logic, are also well worth reading.

The **Theologisch Tijdschrift** for November contains papers by D. Loman on the composition of St. Matthew's Gospel, and by M. N. A. Rovers on 2 Cor. xii. 12, which the writer regards as interpolated. Also the usual reviews. C. P. von Tiele draws attention to two important but very obscure dissertations by Dr. A. Pfizmaier in the Transactions of the Vienna Academy, on the Tao doctrine of Immortality. It appears that this Chinese doctrine stood in the same connexion with the course of the celestial bodies as the Egyptian and the Turanian.

The **Literarisches Centralblatt**, Nov. 26, contains a severe review of Heinichen's new edition of his Commentary on Eusebius.

Science and Philosophy.

Observations on the Geology and Zoology of Abyssinia, made during the progress of the British Expedition to that Country in 1867-68. By W. T. Blandford, late Geologist to the Abyssinian Expedition. With Illustrations and a Geological Map. London: Macmillan and Co., 1870.

This work is divided into three parts: Personal Narrative, Geology, and Zoology. The author is the Deputy Superintendent of the Geological Survey of India, who obtained permission from the Indian Government to accompany the Abyssinian Expedition; and he has given us a very clear account of the geology of the country visited, although this, the most valuable portion of his work, only occupies about one-eighth of the volume. Some very fine woodcuts (from photographs) give an excellent idea of the general character of Abyssinian scenery, and a large coloured geological and physical map enables the reader to connect the external features of the country with the distribution of the several formations.

The greater portion of Abyssinia consists of an undulating table-land of 6,000 or 8,000 feet elevation. Above this rise numerous precipitous hills and mountains, often reaching a height of 10,000 or 12,000 and sometimes even 15,000 feet; while enormous ravines and gorges of many thousand feet deep, carry off the drainage to the Red Sea on the east, or to the Nile Valley on the west. The course of the British expedition lay, for about 300 miles in a north and south direction, along the central ridge or watershed of the plateau, and thus afforded great facilities for the study of its physical features and geology.

The fundamental rocks over a large part of Abyssinia are metamorphic, consisting generally of finely crystalline gneiss, but varying to a slaty rock in which the lines of original bedding are apparent. These form the mass of the table-land, and are exposed in every deep valley. Above 8000 feet the rocks consist mainly of bedded traps, while between these and the metamorphics are a series of sandstones and limestones. These latter are the only rocks that contain fossils, which prove them to be of jurassic age, and the sandstones probably belong to the same formation. The metamorphics are very much older, the dip being nearly vertical; and their surface had been greatly denuded before the sandstones and limestones were deposited horizontally upon them. The traps, which are various in character, and are in some places interbedded with clays and sandstones, are of the same or more recent age.

In the gneissic districts the hills are characterised by huge cliffs which have curved surfaces, and by crags which consist of more or less rounded blocks piled upon each other: these features depending upon the weathering of the rock, which takes place only in those cracks and fissures where the moisture can be retained. The strike of the rocks is north and south, and this has caused the ravines leading up to the plateau to run parallel to the coast of the Red Sea, and thus afford a gradual ascent to the interior. The horizontal beds of sandstone and limestone produce long ranges of cliffs along the sides of the valleys, as well as flat-topped hills, and by their varied colours—brick-red, lilac, grey, or ochreous—form a very characteristic feature in the landscape. The trap rocks, including trachyte, basalt, dolerite, and volcanic ashes, constitute the materials of all the higher mountains and abrupt rocky elevations of the plateau, including most of the Ambas or mountain forts of the natives. These traps probably once covered all the intervening country to the thickness of about 4000 feet, the whole of which, with the exception of isolated patches, has been removed by denudation.

Mr. Blandford is decidedly of opinion that the present form of ground in Abyssinia is wholly due to subaërial denudation. The great ravines, 3000 or 4000 feet deep, and often only about the same width, are certainly due to the action of rain and of the rivers that have flowed in them; while the terraced hill-sides exhibit forms due to the subaërial disintegration of the rocks of which they are composed. He believes that the comparative importance of fresh-water and marine denudation is quite misunderstood by English geologists, owing to the fact that they live in a country where the former is exceptionally weak, the latter exceptionally powerful. In tropical regions, on the other hand (which, it must be remembered, now constitute a large portion of the globe, a belt of 30° each side of the equator being about equal to the remainder of its surface), the reverse is the case. Tropical rainfall is not only much greater than with us, but it is generally concentrated into three or four months

instead of being distributed throughout the year, so that its denuding power over the surface of the country is enormous. During floods, which are of frequent occurrence, the rivers are liquid mud rather than water. The enormous amount of sediment thus carried down to the sea, acts as a barrier to marine denudation, and protects the coasts from destruction; while, where this does not occur, coral reefs answer the same purpose. The result is, that along the shores of tropical continents there are comparatively few signs of that extensive marine denudation which is so characteristic of the sea coasts in temperate and northern regions. If to this we add the consideration, that the climate of almost all the temperate zone has in past ages been more like that of the tropics, with intervening glacial epochs equally favourable to subaërial denudation, we shall be led to conclude that it is only by the study of the geology of the intertropical and glaciated regions combined, that we shall be able to obtain an adequate notion of the power of meteorological causes to mould, to furrow, and to destroy the surface of great continents. It is to be hoped that the Geological Survey of India will undertake to furnish a basis for an estimate of the rate of denudation, by accurately determining the amount of sediment carried down annually by the chief rivers of India, not only at their outlets to the sea, but at several points of their course, especially at their exit from the mountains into the plains.

The lakes of Abyssinia are a very puzzling problem. The only one Mr. Blandford was able to examine was Lake Ashangi, which is 103 feet deep, while the rim of the rock-basin rises about 150 feet above the water. No signs of glacial action were discovered anywhere in Abyssinia; but this may perhaps be due to the rapid disintegration of the basaltic rocks which form so much of the more elevated parts of the country.

The volcanic hills and cones which abound on the shores of the Red Sea, and are sparingly represented on the west side of Annesley Bay, are mostly of recent date, while in some places the disturbance of sedimentary beds, interstratified with volcanic products, indicates comparative antiquity; but no fossils have been found by which their age can be determined. Geologists will find suggestive remarks on many other interesting or disputed questions, on which Mr. Blandford's experience in India often throws light. We may indeed expect, that the science of geological interpretation will be much advanced by the observations of the Indian surveyors, who have the great advantage of studying the denuding action of rain and rivers in a country where these agencies are so much more powerful than they are with us, and where they produce effects far beyond the power of the more placid meteorology of Europe.

The zoological part of the work consists of a systematic catalogue of the species of mammals, birds, reptiles, and molluscs collected, with notes on the synonymy, and on the habits of the species. There is also a short introduction, giving an account of what has been done by previous naturalists, and discussing the range of the species in altitude. The catalogue occupies considerably more than half the volume, which is thus rendered more bulky than necessary, and less convenient for reference, as well as less interesting to the general reader. The personal narrative abounds with notes on the quadrupeds and birds met with; and if all the obtainable information on their habits had been there incorporated, the catalogue might have been printed much more compactly in an appendix (with references to the narrative), and the weight of the volume considerably diminished. A striking example of the inconvenience of the arrangement adopted is seen at p. 102, in the mention of "that most lovely bird, *Pholidauges leucogaster*," found while descending the pass from Senafé on the return journey, at from 2000 to 5000 feet elevation. Not a word being here said of the size, appearance, colours, or affinities of this uncouthly named bird, the reader turns to the index, in order to find it in the catalogue and learn something more about it; but the name is not to be found there. Even if he turn over the 180 pages of the catalogue of birds, and runs his eye down the specific names, very clearly printed in large type, it is still not to be found; and it is only by going through the synonyms, that he at length discovers it under the name of *Grandala leucogaster*, and can get at what the author has to say about it.

Mr. Blandford is evidently a close observer of birds, and thinks for himself as to their affinities. His opinions on points of difficulty are therefore worthy of attention. The sternum of *Indicator*, he tells us, resembles that of the Barbet and Coly, and the bird was observed clinging to the stems of trees, as the Barbets occasionally do. The Colies are placed between the Turacos and the Rollers, but the nest—"a small platform of sticks in a thorny bush"—would remove it widely from both these groups; and Mr. Blandford himself remarks that "the toes are very different from those in other Scansorial Insessores, and even from those of the Plantain-eaters." The Timalidæ are classed with the Craterópidæ, and such genera as *Drymœca*, *Cisticola*, *Prinia*, and *Orthotomus*, are included in the same family. The Larks follow the Warblers, and include the Wagtails in a single family group.

The list of birds reaches the large number of 293 species; and as the author has taken great pains to make himself acquainted with the literature of the subject, it is rather a pity, while devoting so much of his book to a mere catalogue, that he did not include all the species known to inhabit Abyssinia, and thus make it a complete *résumé* of our knowledge at the date of publication.

Good coloured figures are given, of seven new or rare species of birds and of six of the limestone fossils. The author appears to have observed and collected assiduously during his eight months' journey. He has carefully elaborated his materials, and has consulted the writings of previous travellers in Abyssinia; and the result of his labours is an important contribution to the natural history of the country.

Alfred R. Wallace.

Kuno Fischer's Interpretation of Kant. [*Kuno Fischer und sein Kant. Eine Entgegnung*, von Adolph Trendelenburg.] Leipzig: Verlag von S. Hirzel, 1869.

Anti-Trendelenburg. Eine Duplik von Kuno Fischer. Jena: Hermann Dabis, 1870.

Kant's Transcendental Ideality of Space and Time. [*Kant's transcendentale Idealität des Raumes und der Zeit.* Von Dr. Emil Arnoldt.] Königsberg: Albert Rosbach, 1870.

A long controversy which has been going on with alternate replies in the successive works of Professors Fischer and Trendelenburg has come to a final explosion of bitter personalities, and unsparing polemic in the two pamphlets first named at the head of this article. I say final, for the grounds of difference have now been so thoroughly explained, that it is scarcely possible for anything of importance to be added on either side. The substantial gains out of it all are, on the one hand, some new illustration of difficult points, in the philosophy of Kant, and on the other hand a complete and convincing proof that a certain bye-way of philosophy which Trendelenburg had contrived for himself in his *Logical Investigations*, is really a blind way, that leads to nothing.

The question at issue related in the first instance to the validity of Kant's well-known view as to the subjective origin and character of the intuitions of space and time. But in

this question, as it has been discussed, is involved the wider problem of the relation of thought and being, and of the absolute or relative character of our knowledge. According to Kant, the necessary and universal elements of knowledge, can only be conditions imposed upon sensation by the nature of mind. Sensations in themselves give us no knowledge of any object. Only through the unity given by thought expressing itself in the Categories to the manifold of sensation, can we have any experience, that is, any knowledge of objects as such. Further, the manifold of sensation itself which is passively received by the mind can become object of intuition only under conditions of space and time which are the *à priori* forms of sensibility. The Categories, therefore, as well as the intuitions of space and time, are logically prior to experience, as experience is only possible through them. And it is through them that the mere subjective data of sensation are converted into an order of objective existences. Yet this objective order of experience is only objective in a limited sense; it is an objectivity created by the mind, and not given to it. It is therefore the objectivity of phenomena merely, not of things in themselves, which are necessarily withheld from the cognizance of the mind.

Now Trendelenburg in his *Logical Investigations*, and at more length in the 3rd vol. of his *Contributions to Philosophy*, maintains that there is an incompleteness in Kant's logic in regard to time and space. Kant, he says, set before himself only two alternatives, when there are really three possible views. To Kant it seemed necessary that the forms of sensibility should be either objective or subjective, and when he had shown that they could not be *merely* objective, he immediately inferred that they were *merely* subjective. Or what is the same thing, that their objective validity extends only to phenomena. He did not therefore contemplate the possibility that these forms might be both objective and subjective,—a part of the necessary and *à priori* possessions of the mind, and yet at the same time, elements of an objective knowledge, not merely of phenomena, but of what Kant calls "things in themselves." In his *Logical Investigations*, therefore, Trendelenburg would adopt this third view, and thereby fill up what he considers a want in the theory of Kant.

In the end which Trendelenburg has in view of bridging over the great gulf fixed by Kant between the real and the phenomenal object, and so between thought and things, he is not singular. There is a way by which this end may be reached, a way that was followed by German philosophy immediately after Kant, by Fichte, Schelling, and Hegel. And almost the first step in that way is to challenge the conception of "things in themselves," as Kant presents it—for how, it might be asked, is the "thing in itself" different from the objectivity which, according to Kant, thought gives to sensation? And what reason can there be *in thought* to believe in an object not apprehensible by thought? How does Kant prove the existence of "things in themselves"? His reason is ultimately this, that the mind is receptive or passive in sensation, while it is active and spontaneous only in cognition. There must therefore, it is implied, be something that gives or causes the sensation, and this something is prior to and not identical with the something which the mind makes out of sensation. But to this it may be answered that sensation on Kant's own showing, contains in itself no objective reference, and if it be thought alone that determines an object as such, then there is only one object, and not two—that is to say, the phenomenal object coincides with the "thing in itself." Or if not, how are we to distinguish the objective reference that points to the real objectivity of the "thing in itself" from the objective reference that points to the phenomenal object? Now if for such reasons as these it be once admitted that there is no ground for the distinction of the "thing in itself" from the phenomenal object, the contradiction between knowing and being ceases to be insoluble, and we pass necessarily from the Dualism of Kant to an absolute Idealism like that of Hegel. The passivity of Sensation according to which it appears to be given to thought instead of being posited by thought, is seen to be an illusion, in fact, the great illusion which it is the business of philosophy to dissipate. In this way we might accept Trendelenburg's third view, that space and time are both subjective and objective, as the assertion of a thorough-going idealism, which should solve the difficulty presented by the distinction of knowing and being, by showing that it is a distinction in thought, created by thought, and which thought is therefore able to transcend. But this is not Trendelenburg's meaning; to him, as to Kant, the distinction of knowing and being is an absolute one. In his *Logical Investigations* (i. 134) he maintains it to be a last and highest contradiction that cannot be transcended, and in another passage he says that however far we carry our knowledge of objects there is always a remainder, a substratum, a fixed matter, which we cannot explain. In short, that there is always something which with Kant we may call a "thing in itself" outside of knowledge.

But if the idealistic solution of the difficulty be rejected, if between mind and its object there be no ultimate unity, how can our knowledge be objective or real? how can it apprehend more than the phenomenal? Of the "thing in itself," we can know at most only that it is; and in truth as has been shown, there is a self-contradiction in saying that we can know even that. Or if like Trendelenburg we insist on knowing more about it, we seem forced to revive the old notions of pre-established harmony or occasional causes. As we are not able to lift ourselves above and out of our own thoughts in order that we may discern their agreement with the objects they represent to us, we must suppose that *θείᾳ τύχῃ* it has been provided that thoughts should coincide with things, and things with thoughts. To Kant it seemed certain that a necessity laid upon us by our own mind could not also be a necessity laid upon us by an object given to the mind from without, and, as he rejected the hypothesis of occasional causes as involving the transcendental use or rather abuse of categories valid only in their application to the data of sensation, he was forced to declare our notions of time and space to be subjective in origin and character, and applicable only to phenomena.

This Trendelenburg thinks an oversight: and he has a key of his own to the problem. Knowing and being are not, he thinks, even ultimately identical, but there is something common to both. And just as the geometrician, when he is proving the equality of the squares of the sides of a right-angled triangle to the square of the hypothenuse, seeks a common element or intermediate unity by means of which he may compare them (*Logical Investigations*, i. 137), so here the philosopher seeks something common to thought and being by means of which their agreement may be manifested. This common something he finds in movement, which belongs equally to being and to thought, the constructive movement of thought corresponding to the outward movement through which alone matter manifests its qualities. This movement does not indeed exhaust the nature of the objective, since there is always the insoluble remainder already mentioned, but it is that point of coincidence with being that gives reality to knowledge.

It is easy to prove that this theory is one of those crude attempts at compromise which always create more difficulties than they remove. It is in fact, to use a phrase of Kant's, "a nest of contradictions." Suppose for a moment that this common element in thought and being exists—suppose that

there is a movement, or, as Trendelenburg puts it, "a creative energy common to thought and things, though acting unconsciously in things and consciously in thought, which lays open the unconscious to consciousness" (*Contributions*, vol. iii. p. 218), how can it possibly be known? How can thought without transcending itself, without being more than thought, compare itself with being, so as to discover what is the common element in both? No doubt there is a movement of things and a movement of thought, but the movement of things is given to us only in thought, or exists to us only as it is thought of by us. To identify the supposed subjective and objective movements is therefore, as Fischer remarks, nothing else than to confuse the thought of movement with the movement of thought. It is indeed just conceivable that some one might maintain that the thought of movement is the primary thought, both of the objective and the subjective, and might begin a metaphysical logic with this thought, as Hegel begins his logic with being. This would revive, in a somewhat coarser form, the old doctrine of Heraclitus, who found the principle of all things in "Becoming." But ultimately it would bring us back by another way to that identification of thought and being which Trendelenburg has spent almost his whole philosophical life in attempting to disprove.

With regard to the doctrine of Kant, it is clear that the "third course" of Trendelenburg was not overlooked by Kant, but excluded by the necessity of his logic. In Kant's system the dualism or absolute distinction between the "thing in itself" and the phenomenal object, *i.e.* the object as it appears to the subject, rests upon another dualism between sensibility and understanding, and the only way in which from his point of view the unity of knowing and being can be attained is by proving that these two are ultimately identical. Now Kant distinctly contemplated this possibility when he said in the introduction to the *Critique of Pure Reason* that "there are two great stems in the tree of human knowledge —sensibility and understanding, which perhaps spring from a common, though to us unknown, root" (*Kant's Werke*, vol. ii. p. 28, Rosenkranz's edition)—and this was the only form which the question could take in his philosophy. So long as the dualism of sensibility and understanding was maintained, the supposition that time and space should be both objective and subjective, or, as Kant would have preferred to express it, the supposition that time and space should have both transcendental ideality and transcendental reality, remained an absurdity. To understand Kant, we must always remember the relation in which he stood to previous philosophy, and the stage which the problem had reached in his time. As Dr. Arnoldt has shown very clearly, it is forgetfulness of the historical position of the Kantian philosophy that has occasioned the mistakes of Trendelenburg. Yet Kant leaves us in no doubt as to his estimate of the philosophy of his predecessors. Locke had held that space and time are at once empirically and transcendentally real. Berkeley seemed to have proved that to us "esse" and "percipi" are one—that we cannot get beyond our sensations to any substratum or "thing in itself," that in Kant's language our knowledge of all things, and therefore of space and time, is confined to their empirical reality. Hume, however, had argued from the same premises that we cannot know even their empirical reality, for wherever our ideas go beyond the data of sensation, they must be mental fictions, or arbitrary results of association, and therefore, in Kant's language, "empirically ideal;" or, in other words, they are subjective in two senses, as they do not correspond to the true nature of the object or "thing in itself," and as they are arbitrary or accidental, and do not even correspond to the sensations from which they are derived (cf. Dr. Arnoldt, p. 9). Kant, on the other hand, maintained the transcendental ideality and empiric reality of space and time. He maintained that, although not contained in the data of sensation, they are valid for all that empiric knowledge of objects which Hume supposed to rest upon sensation, and that it is only under these forms that the manifold of sensation receives from thought the unity of an object of intuition. But this restores only the empiric reality of space and time, leaving them still transcendentally ideal. To maintain, as Trendelenburg does, the transcendental reality, together with the transcendental ideality of space and time, would have been to attack Berkeley as well as Hume—it would have been to pass beyond those limits of human knowledge which were to Kant the "flammantia mœnia mundi." And to say that Kant merely omitted or neglected this alternative without duly considering it is to say that he had forgotten that which he was fighting against all his life.

What has been said may serve as an indication of the main points upon which the controversy turns, although I have omitted to notice much that is of great interest in connection with the interpretation of Kant. On every point of any importance the last answer of Kuno Fischer seems to be conclusive, though sometimes, not unprovoked, he presses too far a trifling logical advantage. As against Trendelenburg at least, he is almost completely victorious. At the same time, Dr. Arnoldt's pamphlet is most instructive for those who would penetrate into the essential meaning of Kant. It exhibits the matter in a "dry light," less darkened by the smoke and dust of controversy. Dr. Arnoldt shows, moreover, greater speculative acuteness and a greater power of gathering into a focus the dispersed utterances of the *Critique of Pure Reason*. In conclusion I may say that the result of the controversy, and the complete demolition of the *via media* which Trendelenburg has expended so much acuteness and logical force in constructing, is one proof among many that no philosophy can be self-consistent that stops short of absolute Idealism. Edward Caird.

THE GULF STREAM.

TO THE EDITOR OF *THE ACADEMY.*

Sir,—My attention has been drawn to the fact that in a notice of Petermann's recent work on the Gulf Stream in the last number of the *Academy*, I have followed the author in somewhat misstating Dr. Carpenter's views in respect to the extension of that current to the coast of Europe.

The reading of Dr. Carpenter's opinion there given is drawn from a ecture on the Temperature and Animal Life of the Deep Sea, delivered by him at the Royal Institution in February of this year; but in a letter published in *Nature* of the 25th of August, Dr. Carpenter corrects the erroneous impression caused by certain of his statements, and whilst he recognises a north-easterly movement of the upper stratum of the warm waters of the North Atlantic, he clearly distinguishes between this *subsidiary current* and the *Gulf Stream proper*. The former current Dr. Carpenter believes to be "a part of a *general interchange* of the polar and equatorial waters" [probably less rapid in its motion than the surface current, and at a lower temperature*], "which is quite independent of any such local accidents as those that produce the Gulf Stream proper, and which gives movement to a much larger and deeper body of water than the latter can affect," and he "fails to see the evidence that either the heat or the movement of the Gulf Stream proper is directly concerned in the flow of the upper warm stratum of the north-east extension of the Atlantic towards the Hebrides, the Faroes, and Spitzbergen; for, as the stream of superheated water on its emergence into the open ocean spreads itself out like a fan, it must necessarily become shallower as it extends, instead of deeper."

* "Many probabilities leading to the suspicion that the bottom-flow may be considerably less rapid than the surface-current, and its temperature considerably less." —*Nature*, ii. p. 334.

The difference of opinion thus seems to lie, not in the question of the extension of a warm current to Europe, but in the identification of this warm flow with the Gulf Stream of Florida. Dr. Carpenter considers the Gulf Stream as only a special and distinct feature of the great interchange of waters; Dr. Petermann looks upon it as the main feature of the circulation in the North Atlantic. But since Petermann's charts show, for the first time with authority, a regular and constant pulsation of the warmer waters extending without a break from the narrows of the Strait of Florida to Spitzbergen, where *on the surface* shall we draw the line of demarcation between the subsidiary current and the Gulf Stream?

Both, if there be two, as the isothermal charts show, become so blended as to be indistinguishable from one great current, which, for more than one-half of its north-eastward course of 5000 miles, is universally known as the Gulf Stream. Is it not more convenient that one name should designate the whole movement?

Keith Johnston, Jun.

Scientific Notes.

Geology and Natural History.

South African Geology.—No fewer than five papers have been communicated to the Geological Society this session on the geology of Southern Africa, a region which has suddenly sprung into importance by reason of its diamond-fields, which—though yielding stones of inferior value to those of Brazil—have been remarkably prolific in the number and even in the size of some of the stones met with. Prof. Morris has started a new theory as to the source whence diamonds are derived. Hitherto they have been looked upon as coming from igneous and metamorphic rocks, like garnets, rubies, and many other precious stones; a better knowledge of the geology of the diamond-district of South Africa leads us to conclude that these stones come from certain stratified beds containing, besides reptilian remains, numerous plants and much fossil wood. These beds are known as the "Karoo" or *Dicynodon* beds. Prof. Morris calls to mind the remarkable fact (well known to botanists and mineralogists) that in the stems of the bamboo small crystals of quartz are found, known by the name of *tabasheer;* he suggests, whether it may not be possible that the diamonds yielded by these old plant-beds similarly owe their origin to vegetable growth. The idea is well worthy the attention alike of the chemist, the mineralogist, and the botanist. By far the most valuable of these South African papers is that by Mr. C. L. Griesbach "On the Geology of Natal;" a carefully prepared survey, which occupied three years in prosecution, and gives us a good geological map and sections, and numerous fossil remains. Mr. Griesbach discourages the idea of gold being found in quantities sufficient to repay the outlay of European labour and capital.

New British Fossil Crustacea.—The last two monthly numbers of the *Geological Magazine* contain descriptions by Mr. Henry Woodward of seven new species of fossil crustacea from the London clay, chalk, and mountain limestone of England, together with corrections of some others already described.

Glacial Origin of the Valley of the Amazon.—So long ago as 1867, the geological world was filled with astonishment at learning that Prof. Agassiz, in his wonderful interpretation of the geological history of the valley of the Amazon, had arrived at the conclusion that, during the glacial period, the whole valley of the Amazon and its tributaries was occupied by an enormous glacier. Its movement was eastward, it ploughed up and ground down the bottom of the valley, and it built up, as its terminal moraine, a collossal sea-wall of gigantic proportions. With a milder climate the valley became an enormous fresh-water lake. Strata more than 800 feet in thickness were then deposited. At the end of this time the sea is supposed to have worn away the terminal moraine so as to release this vast body of water, which consequently rushed violently seaward, denuding the sandstone it had just deposited save here and there. This wonderful theory has lately been reiterated by Mr. C. F. Hartt in his recent volume which we shall review shortly. Fortunately Mr. Hauxwell, a very careful collector, at present in Brazil, has discovered fossils in this old lacustrine mud-deposit which promise a more tranquil explanation, and tell us of a gradual elevation of the country, changing the condition and position of the river and its estuary, and extending the valley seawards to the east from century to century with the rise of the land, and especially the great water-shed line of the Andes. These shells show, by their contorted character, the presence of brackish (estuarine) water, a sure agent in modifying the form of shells brought within its influence either from the river or the sea.

New Fossil Marsupial.—The remarkable marsupial found fossil in the bone-caves of Wellington, New South Wales, and described in 1859 by Professor Owen as the *Thylacoleo carnifex*, "one of the fellest of the carnivora," has been the subject of considerable criticism upon several occasions by Mr. W. Boyd Dawkins, Professor Flower, Dr. Gerard Krefft, and others, who have disputed its carnivorous character. Prof. Owen recently communicated another paper to the Royal Society on *Thylacoleo* and *Plagiaulax*, an extinct and very small mammal from our own Purbeck beds, treated by Owen as a carnivor, and by the late Dr. Falconer as a rodent.

Fossil Meteorite.—A new meteorite has just been discovered in the miocene deposits of Greenland, and brought to England. It has been offered, we understand, to the Trustees of the British Museum for the sum of 240*l.* This is the first instance on record of a truly fossil meteorite having been met with.

Physiology.

Structure of the Internal Ear.—Dr. Rudinger, of Munich, has just published a short pamphlet, in which he gives the results of his recent investigations upon the minute structure of certain parts of the labyrinth of the ear, especially in relation to the mode in which the auditory nerve terminates. The internal ear consists of three parts, the vestibule, the semicircular canals, and the cochlea. The two former contain a membranous bag and tubes, corresponding in form to the cavities of the bone. The tubes present three ampullæ; and it is to these that Rudinger's observations have been chiefly directed. The branches of the auditory nerve distributed to the ampullæ enter by a groove on their external surface, and are here doubly contoured; but on reaching the internal surface they lose their double contour, and appear as though reduced to the cylinder axis. The internal surface of the ampullæ is lined by epithelium, which, of spheroidal or transitional character through the greater part of its extent, presents a remarkable development on the floor of the ampullæ. Here the layer becomes greatly increased in thickness, and appears to be composed essentially of two forms, one cylindrical, of yellowish colour, and with truncated extremities, which may be regarded as supporting cells; the other, fusiform and ciliate, which may be regarded as nerve cells. The relation of the latter to the nerves is the central point of interest of Rudinger's observations. On staining the nerves with perosmic acid, he finds that after penetrating the basal membrane of the ampulla, and entering the deeper part of the epithelial layer, they form a plexus, with delicate nodules at the point of intersection; and from this plexus fibres are given off which enter the base of the fusiform epithelial cells, and may be traced in their interiors to the nucleus as a fine brownish black stria, and from thence to the peripherical extremity of the cell, where it is prolonged in the form of a fine hair or cilium; the latter, therefore, it would appear, are the true terminations of the auditory nerve, and, floating as they do in the endolymph that fills the membranous canals, are placed under conditions singularly favourable for the perception and propagation of the vibrations of sound.

The Pneumatic Forces carrying on the Circulation of the Blood.—Dr. Buchanan, of Glasgow, has published an interesting and thoughtful essay on this subject (Richardson: Glasgow), dealing especially with those that are referable to the act of respiration. He observes that when any of the great veins that enter the chest—the subclavian, the jugular, or the vena cava—are exposed to view in a living animal, they are seen at every inspiration to shrink in size, losing their cylindrical shape, becoming flattened, and as if so far emptied of their blood as to be no longer distended. These phenomena are coincident with inspiration; and Dr. B. infers that it is the pressure of the external air which empties the great veins of their blood and forces it into the chest. At every expiration again the veins swell out, which has hitherto been attributed to a regurgitation of the blood, owing to the compression of the chest that occurs in expiration; but he shows that it is in all probability due not to a reflux of blood from the heart, but to the accumulation of blood from the smaller veins which is temporarily prevented from gaining entrance into the chest. This suction power, he believes, extends over the whole sanguiferous system—veins, capillaries, and arteries; and in proof refers to the difference in character of the pulse in inspiration and expiration, the phenomena presented when the brain is exposed by a wound, the phenomena of asphyxia, and of the fœtal circulation.

The Migration of Cells.—Dr. Caton publishes a paper in the *Journal of Anatomy and Physiology*, Nov. 1870, on the cell migration theory. It is well known that the blood contains two kinds of corpuscles, the red and the white, floating in a colourless fluid. The white corpuscles are capable of spontaneous movements; and when, from any cause, the current of the blood through the smaller or capillary vessels is arrested or retarded, as occurs during inflammation, the white corpuscles, according to Cohnheim, von Recklinghausen, Stricker, and others, escape from the interior of the vessels, either by perforating their continuous but delicate wall, or by squeezing themselves through minute openings which are believed to exist in the walls. The white corpuscles that have thus escaped become altered and form pus cells,

or in common language, "matter." Some observers deny that this migration really occurs, contending that the passage of the white corpuscles through the vascular walls is an optical illusion, and that pus cells are formed *outside* the blood-vessels. Dr. Caton states that, having undertaken many observations on winter frogs, he was unable to satisfy himself of the occurrence of the migration of the white corpuscles; but at length, on examining strong and healthy frogs in spring, he clearly saw the passage of white corpuscles, as described by Cohnheim. Experiments made upon the transparent parts of fishes led to a negative result; but in tadpoles the process could be seen with great ease; indeed he states that he here observed the apparent migration of red as well as white cells, even when there was no local inflammation.

Relation of Tactile Sensibility to the Mobility of Parts.—MM. Kottenkamp and Ullrich have undertaken some investigations to determine the sensitiveness of different parts of the skin (*Zeitschrift für Biologie*, Band vi. p. 37). They fastened pins, at different distances, into pieces of wood, and then applied them to the skin, as a measure of the acuteness of touch, and no answer was deemed correct unless not only two pins were distinctly felt, but the direction of the line uniting these, in regard to the axis of the limb, whether longitudinal or transverse, could be accurately stated. Taking the upper arm, fore-arm, hand, and finger respectively, the acuteness of sensibility could be expressed by the numbers 1 : 3·5 : 29 : 160; and they lay down this proposition, that the delicacy of the sense of touch in a given region of the skin is represented by the sum of two factors, of which one indicates the mobility of the articular axis, whilst the second is proportional to the distance of the part from that axis.

Botany.

Structure and Affinities of the Passifloreæ.—Dr. M. T. Masters read an important paper on this subject before the Linnean Society at their meeting on Nov. 17th. Jussieu and St. Hilaire held that there is no true corolla in the passion-flower, but two calycine whorls, because both organs drop at the same time. But the mode of development and the internal structure clearly demonstrate that the inner whorl is a true corolla. The flower-tube is, according to Bentham, composed of a union of the calyx and corolla; Dr. Masters, on the other hand, believes it to be an expansion of the axis. Its development is comparatively late. The form of the corona was traced from its simplest form in *Turnera* to its most complicated arrangement in some *Modeccas* and *Passifloras;* in all cases it is a mere projection from the flower-tube, and is of late development, and morphologically of little importance, though essential to the individual life of the plant. The inner portion of the tube is a glandular secreting substance. The anthers are invariably two-celled. The pistil is singularly uniform, one-celled, made up of three united carpels, with three parietal placentæ, and three stigmas. The arrangement of the reproductive organs favours cross-fertilisation. The anthers, originally introrse, become, when fully developed, distinctly extrorse, and it is thus rendered difficult for the pollen to fall on the stigma of the same flower: it falls on to the rays of the corona, on which insects alight in search of the honey concealed at the base of the tube, and carry the pollen away to other flowers. Some species are more easily fertilised by pollen belonging to a different species than by their own: hence hybrids abound. Dr. Masters connects the *Passifloreæ* rather with the *Turneraceæ*, *Samydaceæ*, *Violaceæ*, and *Sauvagesieæ* than with the *Cucurbitaceæ*, with which they have usually been associated; his main argument being the truly hypogynous character of the stamens. In geographical distribution the order is essentially tropical, occurring between 30° N. and 30° S. latitude. The true passion-flowers are almost exclusively American, and chiefly Brazilian. The *Passiflora incarnata*, or original passion-flower of the Jesuits, is one of the few North American species, and has probably been introduced there, being closely allied to *P. edulis* of Brazil. Types of the order more or less divergent from *Passiflora* occur in Peru, India, the Indian Archipelago, with a solitary outlier at Hongkong, Australia, the Pacific Islands, New Zealand, and Africa.

Chemistry.

Synthesis of Indigo.—The synthesis of indigo has at last been achieved by MM. Emmerling and Engler. Their results have been communicated by Prof. Baeyer to the Berlin Chemical Society, and are published in the latest number of their *Berichte*. Acetophenon (the methyl keton of benzoic acid) was converted by means of hydric nitrate into mononitroacetophenon. This azotised body was *reduced and dehydrated simultaneously*, which was done by heating the mononitroacetophenon with a mixture of powdered zinc and dry calcic hydrate (quicklime). The indigo sublimed over, and was recognised as such by its characteristic iodine-like vapours, and also by its yielding with strong sulphuric hydrate the "Indigo-Küpe." The authors could not obtain enough of the substance for the purposes of analysis, but they are continuing their experiments with the view of obtaining this artificial indigo in estimable quantities.

The Aerolitic Shower at Hessle.—This meteoric fall, the first recorded to have taken place in Sweden, occurred at 12.20 p.m. on 1st January, 1869, in the neighbourhood of Hessle, three Swedish miles from Upsala. Prof. Nordenskjöld, who announced the shower last year, has now issued (*Poggendorff's Annalen*, No. 10, 1870) a detailed account of the physical and chemical characters of the stones, and the phenomena attending their descent. They were strewn over a line of country lying 30° E. of S. towards 30° W. of N. Some fell within a few yards of peasants leaving church, another fell close to a fisherman on the Mälar bay Lårsta-Viken, dug a hole 3 to 4 inches deep in the ice, and rebounded; when picked up, it was still warm. The noise accompanying the fall, which was heard in Stockholm, is described as resembling some very heavy thunderclaps, followed by a rattle like the passing of waggons at a gallop, and ending with first a note like an organ tone and then a hissing sound, the whole lasting some minutes. The sky was cloudy, and though apparently unseen at Hessle itself, a luminous meteor was noticed by observers at a distance. The stones vary greatly in size, some weighing nearly 2 lbs., the smallest (and the little ones were numerous) only 0·07 gramme. Though of sufficiently loose structure to break in pieces when thrown with the hand against the floor or frozen ground, it is remarkable that nearly all the specimens are intact, and that some of the stones weighing 2 lbs. which struck the ice of the Lårsta-Viken, failed to penetrate it, though its thickness on that day did not exceed a few inches. These facts support the statements of eye-witnesses as to their remarkably small downward velocity. These meteorites present no unusual aspect, and resemble in particular those of Aussun and Clarac, Haute-Garonne, which fell on the 9th December, 1858. Their exterior is black; within they are bright grey, and sufficiently porous to cling to the tongue, whence it is concluded that their mass has not undergone fusion, as would be required by the theory of Laplace. Chemical analysis proved them to be composed of about 20 per cent. of nickeliferous iron (chamoisite, Fe_8Ni); some schreibersite, and rather less than 1 per cent. of what was probably chromite; a variable amount of iron monosulphide (troilite); a trace of carbon, probably in the form of a hydrocarbon; traces of salts soluble in water; about 10 per cent. of labradorite or anorthite; 37 per cent. of olivine; and 23 per cent. of shepardite. These silicates, it should be remarked, were not isolated for examination, but are assumed to be present from calculations based on the results of an analysis of the mass. The researches of Prof. Maskelyne and Dr. Laurence Smith have shown the existence of shepardite as a mineral species to be highly improbable.

The most interesting feature of the Hessle fall is the association with the stones described above of others mainly composed of carbon. The peasants noticed that some of those which fell on the ice near Arnö soon crumbled to a blackish brown powder, which formed with the snow water a mixture resembling coffee-grounds. A similar powder was found on the ice at Hafslaviken in masses as large as the hand, which floated like foam on water, and could not be held between the fingers. A small amount secured for examination was seen under the microscope to be built up of small spherical granules. It contained particles extractible by the magnet, and, when ignited, left a reddish brown ash. Heated in a closed tube, it gave a small amount of a brown liquid distillate. A quantity dried at 110° had the following composition:—

		Equivalent Ratios.
Carbon	51·6	8·600
Hydrogen	3·8	3·800
Oxygen (calculated)	15·7	1·962
Silicic acid	16·7	0·371
Iron protoxide	8·4	0·233
Magnesia	1·5	0·075
Lime	0·8	0·029
Soda and trace of lithia	1·5	0·048
	100·0	

The combustible constituent of this body appears therefore to have the formula—

n. $C_9H_4O_2$.

It was noticed, moreover, that the stones found in the same district with this carbonaceous substance were, as a rule, quite round, and covered on all sides with a black, dull, and often almost sponge-like crust. The iron particles on the surface of the smaller stones were usually quite bright and unoxidised, as though the stone had been heated in a reducing atmosphere. The author believes that this carbon compound frequently, perhaps always, occurs in association with the meteorites, and attributes its preservation in this case to the fall of the stones on snow-covered ground.

Isotrimorphism of Stannic and Titanic Oxides.—Stannic oxide, resulting from the action of steam on stannic chloride at a red heat, has been shown by Daubrée to take a crystalline form, not identical with

that of tinstone, but of a prism of the rhombic system, in fact to correspond with the brookite form of titanic oxide. Wunder has since found that stannic oxide, under certain conditions, crystallises in the tetragonal forms which rutile and anatase exhibit, and has thereby established the fact of the existence of a complete isotrimorphism between the two metallic oxides. Melted with borax, and allowed to separate by cooling, stannic oxide assumes the forms of rutile and tinstone; replace this flux by phosphorus-salt, and the oxide crystallises in the form found in anatase. The usual blowpipe bead is of sufficient magnitude for the success of the experiment; and in order to produce well-developed crystals, the bead, as soon as it has become clear, should be retained for some time in a region of the flame which, though somewhat cooler, is still sufficiently hot to just prevent its becoming opaque. The crystals are finally separated from the material of the bead with warm hydrogen chloride, and measured under the microscope. In compound beads crystals of both kinds occur, that form of crystal predominating whose flux was present to the largest amount. By the addition of phosphorus-salt to a borax bead filled with crystals of rutile, and subsequent fusion and prolonged gradual cooling, crystals of anatase appear. The mean of some measurements of the angles formed by the two polar edges bounding a face of the prism, on such an artificial crystal of anatase, was 40° 46′, the same angle on a natural crystal being 40° 35′.

The Metallic Peroxides prepared by Electrolysis.—Wernicke has examined these bodies and the conditions favouring their formation, and has obtained the following interesting results. The battery used consisted of two Daniell elements; when the strength of the current was increased, oxygen was evolved from the positive plate, and the yield of peroxide diminished. The so-called peroxides deposited from alkaline or neutral solutions of the metals, are hydrates of the form RO,H_2O or $R_2O_3,2H_2O$, and have the following constitution and specific gravity:—

Hydrate of lead peroxide . . .	PbO_2,H_2O .	6 267
Hydrate of manganese peroxide .	MnO_2,H_2O.	2·564—2·596
Hydrate of bismuth peroxide . .	BiO_2,H_2O .	5·571
Hydrate of cobalt peroxide . . .	$Co_2O_3,2H_2O$.	2·483
Hydrate of nickel peroxide . . .	$Ni_2O_3,2H_2O$.	2·744

In thin films these compounds exhibit very beautiful interference colours, those of cobalt being especially marked by their great brilliance and permanence. In explanation of the diminished yield of metallic peroxide when stronger currents are used, it is assumed that in such cases hydrogen peroxide is simultaneously formed, and these two bodies decompose each other, oxygen being evolved and an hydrated oxide produced. This view is favoured by the fact that in acid as well as alkaline solutions, such as those of manganese and lead nitrate, with increased current intensity, basic oxides are set free at the positive pole.

Metallic Vanadium.—Prof. Roscoe has observed that the amount of hydrogen taken up by metallic vanadium varies with the more finely or coarsely divided condition of the chloride, VCl_3 (V=51·3) employed for its preparation. The metal containing hydrogen absorbs oxygen from the air, loses its lustre, and turns dull grey. An analysis of this body gave the numbers: vanadium, 87·8, hydrogen 1·3, oxygen 10·9 per cent. Metal absolutely free from oxygen has not yet been formed, By heating the dichloride, formed from the tetrachloride, in a current of hydrogen, he obtained a product containing 95·8 per cent. of metal, but the method of reducing the vanadium chloride with sodium was less satisfactory. The tetrachloride, in contact with sodium, decomposes with explosion; the reaction with the solid chloride at a red heat takes place more readily.

Henderson's Patent Steel Process.—Mr. James Henderson, of New York, contributes to *Nature*, for Dec. 1st, an account of this new process. The object is the production of steel by the partial decarbonisation of cast-iron by the combined use of fluor-spar, or other fluorides, and titanic acid applied to cast-iron at the melting temperatures, preferably in reverberatory furnaces. Fluorine is given off from the fluor-spar, and is a more powerful agent for the removal of silicon than oxygen, getting rid of it almost entirely from the cast-iron before the reactions with the carbon begin; the phosphorus and sulphur are next acted upon and eliminated in the order they are named by means of the combined action of fluorine and titanic acid, *i. e.* fluorine, titanium, and oxygen. Last of all the carbon is removed. The fluorine is derived from fluor-spar combined with iron ores containing titanic acid in such a way as to ensure simultaneous action of the fluorine, titanium, and oxygen, upon the cast-iron; and by reason of the affinities of these substances for silicon, phosphorus, sulphur, manganese, arsenic, and carbon, they are taken from the iron in the form of vapour and slag; whilst the purified metal is left behind, to be hammered or rolled for the market.

Physics.

Method of Determining the Co-efficient of Reduction for Tangent-Galvanometers.—The co-efficient of reduction for the indications of a tangent-galvanometer, or the factor by which the tangent of the angle of deflection produced by any current must be multiplied, in order to get the strength of the current expressed in absolute units, may be deduced by a well-known formula from the dimensions of the instrument, when the strength of the horizontal component of the earth's magnetic force is known for the time and place of experiment; or it may be ascertained by comparing the amount of chemical decomposition effected by a current in a given time with the deflection it produces. A third method, capable of being carried out more readily and with simpler instrumental appliances than either of these, is recommended by A. Wassmuth, of Prague (*Pogg. Ann.* Supplement, vol. v. p. 167), and is founded on a knowledge of the absolute electromotive force of a Daniell's cell. The experimental part of the process consists in the compensation of a Daniell's cell by one of greater electromotive force, as in Poggendorff's method of comparing electromotive forces, the galvanometer to be examined being introduced into the branch-circuit. Then, putting e for the electromotive force of the Daniell's cell, and r for the resistance of the branch-circuit including the galvanometer, the strength of the current c traversing the galvanometer is given by the equation—

$$e = cr;$$

and, combining this with the observation of the deflection produced, we get the factor required. For the value of e, the author adopts the number resulting from Professor von Waltenhofen's measurements, namely, 12·04 "Jacobi-Siemens units"; that is to say, 12·04 times the electromotive force which would produce, in a circuit whose resistance is equal to that of a column of mercury one metre long and one square millimetre in section, a current of the same strength as that which would evolve in a voltameter one cubic centimetre per minute of explosive gas at 0° C. and 760 millimetres pressure.

The Nature of Vowel-Sounds.—A discovery announced in the *Comptes rendus* for the 25th of last April, by Rudolf Koenig, the well-known maker of acoustical apparatus, seems likely to have an important bearing on some points of philology. It is known that Helmholtz has shown that the distinctive character of the vowel-sounds is due to fixed tones characteristic of each, and that he has investigated the pitch of the tones proper to the different vowels, by examining the resonance of the cavity of the mouth, when adjusted for whispering them, by means of vibrating tuning-forks held near the opening of the lips. In this way he arrived at the following results—

Vowel	U	O	A	E	I
Characteristic tone . .	*f*	$b^{\flat}$	$b^{\text{iii}\flat}$	$b^{\text{iii}\flat}$	d^{iv}

Koenig, on repeating Helmholtz's experiments with more complete apparatus, has entirely confirmed his general result, but has arrived at slightly different conclusions as to the characteristic tones of the vowels U and I, which he finds are respectively lower and higher octaves of the tones of the intermediate vowels. For the North German pronunciation (to which Helmholtz's results also refer) the vowels are accordingly characterised as follows:—

Vowel	U	O	A	E	I
Characteristic tone . .	$b^{\flat}$	$b^{\flat}$	$b^{\text{iii}\flat}$	$b^{\text{iii}\flat}$	$b^{\text{iv}\flat}$
Simple vibrations per second (approximate)	450	900	1800	3600	7200

As Koenig points out, it is more than probable that the physiological reason of the occurrence of nearly the same five vowels in different languages, is to be sought for in the simplicity of these ratios, just as the simplicity of the ratios of the musical intervals explains the adoption of the same intervals by most nations.

Ebullition of Non-miscible Liquids.—An experiment which affords a striking illustration of the law that the vapour-tension of a mixture of two mutually insoluble liquids is equal to the sum of the vapour-tensions of the two liquids taken separately, has been described by August Kundt (*Pogg. Ann.* vol. cxl. p. 489; July, 1870). He finds that sulphide of carbon, which boils by itself at 46·6° C., boils in the presence of water at nearly 43°, and that, if sulphide of carbon and water, which have been heated separately to 45°, be mixed together, the mixture boils briskly until the temperature has fallen to 43° or 42°.

Superstition and Force.—Essays on the Wager of Law; The Wager of Battle; The Ordeal; The Torture. By Henry C. Lea. Second Edition. Philadelphia: Lea.

Mr. Lea's book is not what its title-page would lead us to expect, a contemptuous exposure of the cruelty and superstition of past ages; it is an impartial history of the attempts made by the European nations to shape out of their ancestral beliefs and customs a trustworthy system of judicial evidence. The author undertakes his task in a catholic spirit, rightly observing that these rude judicial institutions claim respect both as improvements upon a past state of society, and as first steps towards future progress. The history of each system is preceded by an examination of the principles on which it was based. Proofs are also furnished of its existence among nations entirely, or almost entirely, unconnected by blood or intercourse with those of mediæval Europe, and a strong presumption is thereby established that all these systems—the judicial employment of torture excepted—were, in like manner, indigenous among the tribes which broke up and parcelled out the Roman Empire. Each institution is traced from its earliest germs to its fullest development in the different communities of Europe, examples of its practical working are furnished, and the causes and slow process of its decay are analyzed. The opening remarks of the Essay on the Wager of Law point out that,—

"The loosely-knit organizations which overthrew the Roman empire were based upon two central principles—the independence of the individual citizen, and the solidarity of the family; and on the mutual interaction of these organic laws was based the jurisprudence of the period. The criminal was not responsible to the State, but to the injured party, and all that the state professed to do was to provide some definite process by which the latter could assert his rights."

The proceedings by which those individual rights were asserted or defended were regulated by the other great central principle—that of family partnership. All the members of a kindred were indissolubly united. For the crime of one member all suffered; the wrong done to one was to be avenged by all. Compensation as an alternative for reprisals was collected from the whole family of the offender at a rate measured by the different degrees of kindred, and similarly distributed among that of the sufferer. One prevailing exception there was to the universal law; a priest neither contributed nor received a share of compensation imposed upon, or claimed by his relatives. In case of his murder, the Church, not his family, received the *wer-gild* (not *wehr-gild*). The solidarity of the Church alone dissolved that of the family. The principle of the unity of families was the natural basis of *compurgation*, a form of procedure whose strong and rapid growth extended in the middle ages from Southern Italy to Scotland. In our own day the last flickerings of its vitality have been evoked in English law courts, and in America it has never been formally abrogated. So early as the laws of Canute we find *compurgation* modified in this country into a close resemblance to its modern offspring, trial by jury. In Welsh law, of which it became the leading characteristic, the custom steadily kept its pristine form, but the number of conjurators rose to a degree which marks the primitive conception of the family widened into that of the clan.

The Wager of Battle, unknown both to the Cymry and the Anglo-Saxons, although practised by the barbarian tribes of Europe, is mentioned by the Senchus Mor in terms which prove its existence among the Irish from the earliest times. Towards the close of the 13th century, when the judicial combat was at its fullest vigour, wager of battle in France lay against judges of all courts, that of the king only excepted. In England, as in Germany, it lay against the sovereign himself; at the coronation of our Norman kings, the champion was by no means a mere lay figure in a state pageant. Mr. Lea has collected many curious facts illustrating the legal duel, particularly as to the measures restricting its use, and the employment of champions. The custom last-named appears to us especially marked by that union of lofty theory and corrupt practice which so strongly characterizes mediæval legislation. In its practical working intolerable abuses were developed which rendered the venal office of champion not less infamous than that of the hangman. But in the original system which was based on the principle of solidarity, that office was set apart as the sacred and self-imposed duty of a kinsman; and the substitution of battle undertaken on behalf a relative for the fine paid by the family reflects the spirit of a chivalrous age, according as it does with the sentiment which gives the key-note to such mediæval legends as the "Childe of Bristowe;" that feeling which counted worldly gear too cheap for vicarious offering, and held that in another's ransom a man must be willing to give nothing less than his own self. Cripples, priests, and women, were allowed to substitute a champion; but in Germany the latter frequently fought in person, under conditions in their favour calculated to satisfy the most uncompromising partisan of woman's rights.

The essay on the Ordeal is interesting and suggestive in the highest degree. The appeal to the Judgment of God under all its various forms is referred to the strong impulse under which "men oppressed by doubt have essayed in all ages to relieve themselves of responsibility by calling in the assistance of Heaven." That the custom was well-nigh as universal as the feeling which gave it birth is proved by a consensus of practice extending from the eastern limits of Asia to the shores of western Europe. To the examples of its use as an extra-legal rite, among the Greeks and Romans may be added the striking and well-attested instance of the Hirpi, at the sacrifice of Apollo, on Mount Soracte. In India the ordeal still flourishes under certain forms, between which and the provisions for its use in Anglo-Saxon dooms Mr. Lea indicates points of similarity not less striking than the close resemblance the Brehon law exhibits between the Irish custom of "fasting upon" a debtor and the modern Hindoo practice of sitting motionless and fasting at his door. From the immobility of eastern usage such coincidences cannot be dismissed as accidental; they not only point to the strong family likeness established by Mr. Lea, between the ancient law-systems of Asia and the codes of mediæval Europe, but add weight to the argument this furnishes for the common origin of the great Aryan family of man. The author's illustrative formula is from Baluze, but he might have chosen a better example first-hand from the prayers and adjurations for the hot-iron and water ordeals in the Durham Ritual where various formulas of the christianized pagan rite stand in fit juxta-position to those for the consecration of

vessels which had in heathen days held offerings to Thor and Woden. The apocryphal version of Godwin's death although valuable as illustrating superstitions connected with the *Corsnaed*, is worthless as an historical fact. A sudden stroke of apoplexy at table coming upon a man who had worked hard and perhaps lived harder still, after the fashion of his time, need neither be referred to miracle as in the Latin Annalists, nor to treachery, as Mr. Lea suggests. The last crime of which Edward the Confessor would be held guilty is that of poisoning his father-in-law at his own table. Like the Wager of Battle, the Ordeal was entirely rejected by Maritime law, and the following causes gradually brought both customs into disuse—the growth of the commercial and municipal spirit, the revival of Roman law, and the vigorous opposition of the Church.

It is not surprising that the Judgment of God, appealing as it does to a sentiment common in all times to all the human race, should still in our own day keep its last stronghold in ignorance and superstition; but the fact is startling that a system so utterly repugnant to humanity and civilization as that of torture should even now be vital both in Europe and America. Under Roman law and the codes of the barbarian tribes slaves only were tortured, with this difference, the former tortured the slave both as criminal and witness, the latter only as a criminal. The adoption of the practice by the Church in the thirteenth century gave it currency throughout Europe, where the system in full operation became more intolerable than it had been among the ancients. In the essay on torture, as in the preceding sections, great stress is deservedly laid upon the policy followed by the Church in her adoption or rejection, as circumstances dictated, of forms of procedure which were all in themselves alien to her primitive spirit and constitution. In this respect Mr. Lea has made a larger contribution to ecclesiastical history than any modern English writer who has gone over the same ground. His book has been written with a thorough knowledge of the subject; it is distinguished by admirable clearness of expression, and a judicious selection and arrangement of elucidatory facts from the copious materials which the author's learning and research have placed at his command. Also its value to the historical student will be greatly enhanced by the skilful blending of philosophical reflection with the exposition of events.

George Waring.

Sources of German History. [*F. C. Dahlmann's Quellenkunde der deutschen Geschichte.* Dritte Auflage.—*Quellen und Bearbeitungen der deutschen Geschichte*, neu zusammengestellt von G. Waitz.] Göttingen: Verlag der Dieterichschen Univ.-Buchhandlung, 1869. 8vo.: xviii. and 224.

Criticism, so peculiar a characteristic of our age, has (for the first time in historical science) laid special stress on the value of contemporary sources of information. And continental Universities now possess teachers of history who have extended the range of their enquiries beyond what is implied in the mere knowledge of facts; whilst in their writings they have produced models of research, which, by influencing their numerous scholars, have led to further progress. In Germany the whole of this development is linked with two names, those of Ranke and Pertz. Pertz's collection of the original authorities has no rival, while Ranke has worked up the materials into masterly creations of historical science. And yet it is only within these last years that works have been produced which could serve as direct clues to guide us in studying the history of Germany in the middle ages: I mean Wattenbach's *Handbook of the Sources of German History* (now in its second edition), and Potthast's *Bibliotheca Medii Aevi*. It requires a long search, however, in these two books before one can get together a list of the original sources for any given period; while nothing whatever had hitherto been done for the later literature on these subjects, which could only be collected by working through extensive libraries. Hearers of University lectures who wished to pursue the enquiry further, have sorely felt the want of such a Handbook. Dahlmann had made a special Synopsis of the original authorities and later writers of history for the purposes of his Lectures, the enlarged edition of which shewed what a reception it had met with in a much wider circle. After the author's death, Waitz made a completely new work out of his predecessor's materials. Dividing all German history down to our own days into periods, he has given us a systematically chronological arrangement of our original authorities and later historians for each period.

In such an undertaking our first question must be whether we should take German history as a whole, or only the history of the Empire, or whether a combination of the two may not be preferable. A mere history of the Empire is defective, since the Empire only came into existence centuries after the rise of the German people. On the other hand, to describe all the historical forms which the life of the German people has assumed, is too extensive a task; and anything like an accurate account of the literature connected with the subject would be simply impossible. We must therefore choose out a narrower province, and such may be found if we confine ourselves to considering the main periods of development in German history.

To the literature of the subject, whether original or secondary, we can add little beyond a few remarks. A comprehensive general history, corresponding to the requirements of the present day, does not yet exist. Notwithstanding the number of Prize Essays published within these last few years, such a history yet remains to be written. The reason lies partly in the great extent of the subject, but partly also in the want of sufficient monographs. We must not, however, conceal our view that the method of all German historical enquiry at present is unsatisfactory, chiefly because it is still too much under the influence of the Juristic school. We learn from it hardly anything of the real family and social life during the middle ages and the later time. Considering the perfect picture of Classical Antiquity which philologists have given us from all points of view, we must feel ashamed when we reflect on the far richer material available for German history. There is no exhaustive history of German culture in any one of its branches. It is to be hoped that the example Gustav Freytag has set in his *Pictures from the Life of the German People* may bear fruit by influencing the professed historian. We should like to make one more protest against the polemical style of writing lately come into fashion in Germany. Scientific questions are treated from opposite points of view with a bitter hostility that cannot help research, and exhibits painfully the littleness of party-spirit.

As to Waitz's list of original authorities prefixed to each section, we may let it pass here. Wattenbach's book and the various "Collections of Documents" present a clearer and richer view as far as regards the middle ages. A medieval work is written usually by monks, and has a sharply-defined local or intellectual range. For German history the original authorities of France and Italy also come under consideration, indeed the editors of the *Monumenta Germaniae* have been obliged to include all central Europe in their range as the work went on. For the Frankish ages, Gregory of Tours, Fredegar, the *Gesta Regum Francorum*, and the *Lives of the Saints* are sufficient—for they are all we have; but for the times of the Frank Emperors, for instance, the list, pp. 95 and 96, is not many-

sided enough to supply a complete picture. From the end of the 13th century our leading source of information is one which before this time only ranks on a par with the Chronicles; viz. the original documents and state papers. The publications of the Munich historical commission will throw new light on these times and we already see their importance from the additions to the Town Chronicles and the first volume of the *Proceedings of the Diets of the Empire*. As the history goes on, these sources increase in importance and ultimately become almost our only trustworthy authorities—the complete recognition of this fact for the first time being again a service we owe to Ranke. It is a cheering circumstance that most of the governments have liberally thrown open their secret archives, but enough has not yet been effected in this direction. The treasures of the French archives are public property, and open to every one's use without further formalities. In Prussia, on the other hand, special leave from the minister is necessary, and even with this there are other disagreeables which make working very difficult.

Such are the considerations to which a perusal of Waitz's book give rise. And we conclude by expressing the hope that when another edition of Dr. Waitz's book becomes necessary, the author may be able to double his lists.

W. Arndt.

The Letters and the Life of Francis Bacon . . . newly collected and set forth . . . by James Spedding. Vol. v.: pp. xvi. and 422. 8vo. London: Longmans, 1869.

This volume, the twelfth of the latest edition of Bacon's *Works*, covers the two years and a half which precede the last day of June, 1616—the day of Coke's disgrace, and that from which Mr. Goldwin Smith would date the English Revolution. It deals with events of great interest to the historian of law and of society, and it is composed in a manner which clearly displays Mr. Spedding's merits as well as his defects.

These defects are now well known. He is prolix and inelegant. He follows his chronological order often to small purpose, and often so as to destroy the unity of important episodes. Naturally prejudiced in favour of those whom he has known so long and so well as James and Bacon, he has a tendency to assign to the latter much that is simply Baconian (or rather Elizabethan or Jacobean), and though he does not look at facts from a modern point of view, he is above that commonplace weakness, but he loses sight of principles which prevail in most civilized societies. He describes without apparent indignation the treatment of Peacham: it does not strike him that a great lawyer stoops in continually soliciting promotion and continually carping at a great rival; he contends, if not against evidence at least without conclusive evidence, that Bacon had for the king the regard which law-officers now have for their parties; and he falters in the resolution stated in his preface (p. v.) of shewing only what Bacon thought about the occasions of his time, and often tries to shew that he was wise and virtuous.

Mr. Spedding's merits are learning of the right kind, industry, acuteness, and zeal, and these he has in so great a measure that it is almost as futile as it is unpleasant to speak of his defects.

The letter to the king advising him to call a parliament (Petyt m.ss. Inner Temple, No. 538, vol. 37) is an instance, and the memorial of some points which may be touched in his Majesty's speech to both houses (p. 24) and the king's decree (p. 385) are better instances of papers which ordinary people might say were not necessarily Bacon's—of the authenticity of which at least we need some formal proof, something more than an "evidently," something for which Mr. Spedding, who is so lavish of his space, might have found room.

The book may be said to open with the proceedings against Talbot, a member of the Irish parliament, who had evaded a formal repudiation of the doctrines of Suarez as to the duty of Romanist subjects towards heretical kings. Suarez, Bacon sketches (p. 9), almost in the style of *Lothair*, as "a professor in the University of Coimbra, a confident and daring writer, . . . one that fears nothing but this, lest he should seem to doubt of anything, a fellow that thinks with his magistrality and goose-quill to give laws and manages to crowns and sceptres." Talbot, like many others in his position, was sentenced, but probably not punished.

Next come arguments in favour of holding a session of parliament addressed to James by Bacon, whose political ideal, the same in this respect as Strafford's, was "a parliament absolutely submissive to the Crown rather than naked despotism," and with these arguments proposals for legislating, often in the best way, on many questions of public economy, criminal law, tenure of land. One of them, a "bill of grace," made "the estates of attainted persons liable for the payment of their just and true debts" (pp. 15, 41).

The unhappy dissolution of the parliament, that of 1614, necessitated new devices for raising money, and among these a "voluntary oblation." To set such a thing on foot was to appeal from the House of Commons to the country: the project was attacked by one Oliver St. John (neither the Lord Deputy of Ireland nor the defender of Hampden), and, though a practical failure, it did not fail till in spite of Bacon it had been branded as a "Benevolence" (pp. 81, 111, 130, 168). Another device was the enfranchisement for money of copyholds (p. 114). Many more were contained in a m.s. now lost (p. 129).

Meanwhile, to make up for calling no parliament, a reform of the law, including a scheme for official reporting, was advised by Bacon (pp. 84-6).

We are now in 1615, and Peacham, a Puritan clergyman, is brought before us. He had been charged with libelling his diocesan, and in his house m.ss. had been found criticising the king and foretelling the end of his measures, but not, at least not directly, inciting to rebellion, and, if intended for publication, unpublished. Though an old man, he is tortured, tried for treason at the assizes, convicted and sentenced, but allowed to die in prison. Has Bacon to answer for the torture, and for having urged that the judges should be sounded before the trial? Mr. Spedding says that torture, though not warranted by law, was in this case used by a body, which, like the House of Commons now, was not answerable to the law courts (p. 92, n. 2), and that Bacon's part was subordinate and ministerial only. He says also that it was advisable to sound the judges, and that Coke, as his behaviour in Owen's case (pp. 114, 118), and in Weston's (p. 211), and even in this case, showed, was not sincere in objecting to be sounded (pp. 105, 114 foll.). To the second part of this reply it need only be answered that Bacon's notion of a judge, illustrated by his promise in p. 243, and by his suggestion in pp. 252-3, excludes the notion of judicial independence. To the first one might rejoin that a patriot and even a partisan is most valuable when he best preserves his honour and satisfies his conscience, and that a conscientious and honourable man who was (as Bacon was) above his age would not have assisted at Peacham's torture.

There follow the prosecution of Owen for an attack on the king, and of St. John for his attack on the "oblation," proceedings rather menacing than serious. A whisper of a new parliament is a confession that the subscription has failed.

The topic most interesting to the general reader is the murder of Overbury. Mr. Spedding's conclusion as to the connection of James with the affair (a conclusion resting on a good deal which is not imaginary, but arrived at

with some needless abuse of Prof. A. Amos), may be said to be this. When James first heard the evidence on which Somerset was suspected of complicity in the murder, he treated him as usual because he would not prejudge him, and he said that he should never see him again because he feared that on the trial for which he thought it right to send him he would be convicted. On hearing the *prima facie* case made against him before the commissioners, he pressed him to plead guilty that it might be the more easy for him to pardon him. When Somerset threatened to accuse him of —— we do not *know* what, he was frightened, because, though innocent of everything, any accusation would have injured him, or because Somerset *might* have known something of (say) his intrigues with Spain, the disclosure of which would have been painful. The king let the trial go on out of love of justice; he did not allow the execution of the sentence, partly from fear that it might be unjust, partly because the earl's fall was punishment enough if he were guilty, partly from pity. The reader must say whether this theory is so satisfactory as to justify Mr. Spedding in passing *sicco pede* over the received one. As to Bacon's share in the matter, the insinuation that he was employed to get Somerset convicted, though unjustly, needs no answer: but would Sir Roundell Palmer, had he been attorney, have consented to draw the pardon for the confessedly guilty Lady Somerset?

The case of Commendams, the *Rege inconsulto* case, the conflict between the Chancery and the King's Bench, and the state of the Irish parliament, are the chief subjects which remain.

The first two both raised, though in different ways, the question whether the judges might try causes in which the royal prerogative was concerned without first hearing what the king's counsel had to say. In each the king was (to use his own phrase) "wounded through the sides of a private person:" in the first he had granted to Neile, Bishop of Lincoln, in respect, perhaps, of the "exility" of his bishopric, a living *in commendam*, to be held together with the revenue of the see; but certain people claimed a right to present to the benefice and went to law with the prelate, and so two points arose, one whether James could grant this living, one whether he could grant *any* livings *in commendam* and so (practically) redistribute the property of the Church; in the second case James had granted to a favourite a patent office, the holder of which was paid by fees to which another person was entitled, and, when the latter was for asserting his right, Bacon submitted that the point could not be argued *Rege inconsulto*. Of course the difficulty sprang from the confusion, not yet ended but then at its worst, of the king and the sovereign.

As to the conflict of the courts, the question was whether, the King's Bench having decided something and the Chancery having set aside the decision, the former could punish (if not the equity judge) at least the appellant and his legal advisers. The king, on the ground that he was especially present in his Court of Chancery, held the negative. We should say that each and neither of the two tribunals was to blame, that the conflict of jurisdiction, though no doubt caused by greed and jealousy, was necessary and expedient, and that the law-courts stood in need of co-ordination.

But these are antiquated topics, though unhappily not entirely antiquated. One of more practical importance is that of the Irish parliament. The reform of that assembly, praised by Mr. Spedding (vol. iv. pp. 382-7), with its notable device of fictitious boroughs to make up for the want of real ones, is now bearing its fruit (vol. v. pp. 2, 376). Strange, and yet not strange for a nation so fond of giving birth to parliaments as to have presented Jamaica with one, that the expedient of a sham representation, more profligate than that of Union, carried out again in 1654, in 1656, in 1658, and not the expedient of "an honest, able, and humane Lord Deputy, with full powers," should have seemed *una salus* of Ireland. Bacon wishes to play off the Irish and the English parliaments against one another (vol. v. p. 2). As the former grows malleable, he goes on to advise that recusancy should be connived at, that, by moving the army about, the veterans who had become all but settlers should be shaken off, and that, while *they* remained in reserve, tiros should have their places and pay, that, the privy council being kept apparently intact, a committee of council on finance should be appointed (p. 376). Even then, though Chichester still was deputy and Davis attorney, and though Bacon, sagacious and naturally mild, was a privy councillor, "the full measure of Free Trade" given by St. 1654 c. 32, but withdrawn at the Restoration for a century and a half, was not suggested,* and the tolerant views of Bacon and Chichester were successfully opposed by religious bigotry.

It is presumptuous to doubt whether Mr. Spedding, in the defence of Bacon which he has without intending it undertaken, has chosen the best line. We may fairly say of the attorney's schemes that they were not absolutely bad (if the word "absolutely" has a place in the political dictionary) and that to many junctures they were well suited: we *must* say of them that a people, who though intelligent, could, as he puts it (p. 243) "better skill of *concretum* than *abstractum*," and "the traces" of whose affections flowed "rather after persons than things," on the whole disapproved of them, and that, therefore, they should have been abandoned.

It may be worth asking if the sentence in p. 251, "*Ignoramus* was wiser than those who know too much" can refer to the comedy, and if "*Tyrones*" (p. 376) is meant for a joke.

R. Robinson.

Intelligence.

The Eleventh Meeting of the German Historical Commission took place from the 1st to the 5th of October last, von Ranke in the chair.

The following works are now ready or nearly so:—*Geschichte der Germanischen Philologie*, von R. v. Raumer (out); *Die Recesse u. andere Akten der Hansetage von* 1256–1430, Bd. 1; *Briefe u. Akten zur Geschichte des dreissigjährigen Krieges in den Zeiten des vorwaltenden Einflusses der Wittelsbacher*, Bd. 1: *Die Gründung der Union*, 1598–1608, bearbeitet von M. Ritter.

The great biography of the celebrities of Germany, edited by Liliencron, is to contain 40,000 articles in 20 volumes. The *History of Zoology* by Victor Carus is already in great part printed; the *Histories of Classical Philology*, *Historiography* and *Medicine*, have been undertaken by Bursian, Wegele, and Hirsch respectively. The *History of Botany* has to be arranged for afresh; but it is estimated that the whole series of the *Histories of German Sciences* will be completed by 1876.

The 2nd volume of the Chronicle of Strassburg is nearly printed: those of Nürnberg (4th volume), Cologne, and Lübeck are progressing. The *Reichstagsakten*, on the contrary, have been delayed by untoward circumstances. A new part of the *Yearbooks of the German Empire*, the History of King Pippin (Oelsner) is already in print: that of Ludwig the Pious (Simson) is partially written: that of Otto the Great, formerly in the hands of the late R. Köpke, will probably be undertaken by Dümmler. The History of Heinrich II. is committed to Breslau, of Heinrich III. to Steindorff, of Philip of Swabia and Otto IV. to Winkelmann. The researches into the Wittelsbach correspondence have brought to light a large quantity of material, not merely of German but of European importance. Other works were also progressing. It was observed that in the election of new members an inclination was shown to strengthen the relations of the Commission with German Austria.

PROFESSOR MAINE'S FIRST COURSE OF LECTURES.

In his new capacity of Professor of Jurisprudence at Oxford, Mr. Maine has this term given a course of lectures of more than ordinary interest. His main object was to call attention to the vast and in great measure unexplored field which India offers to the student of the history of law. Recent researches, especially those of von Maurer and Nasse, had led to important results for the early history of Teutonic and Slavonic

* Comp. Lord Mountnorris's book on the Irish Parliament (vol. ii. p. 244) with "The restrictions laid upon the trade of Ireland," printed in "Debates relative to the affairs of Ireland" (1763-4).

institutions: and these, Mr. Maine shows, may be confirmed and extended in the most remarkable way by the parallel phenomena of India.

The village group, with its threefold division of the land which it holds in joint ownership—the township, the arable mark, and the waste—with its council of elders, the authorised depositary and exponent of the customary law by which the relations of the cultivators of the common property are regulated, forms the basis of primitive society in India as in Europe. The various causes which tend to dissolve this unit, and to reduce its members to the condition of independent owners, were next traced. These are the absorption of village communities into cities; the predominance given to the family or officer which represents the group in its dealings with a central government; the growth of the commercial spirit, with the rules and practices which it implies; the adoption of new methods of tillage made necessary by the removal of the society to countries under different physical conditions; in India itself, the disintegrating influence of the written English law, accepted by the natives with surprising readiness.

Recent inquiries of the Indian Government have thrown great light upon the nature of these societies; and in many parts of England, rules still in force respecting the cultivation of land show traces of similar institutions among the English settlers.

Mrs. Bray's The Revolt in the Cevennes.—This description of the struggle of the Protestants against Louis XIV., after he had revoked the Edict of Nantes, is vivid and clear, and forms a companion picture to the history of the Covenanters in Scotland under Charles II. It rests, perhaps, too much on Cavalier's description of his own exploits (he escaped to England, and took service under Queen Anne); but this gives us a series of leading events to which the rest can be referred; and it is well that the enthusiasm of the persecuted mountaineers should make its voice sometimes heard in history against such wanton tyranny as that of the Great King.

IN MEMORIAM.

Mr. Richard Robinson, Fellow and Tutor of Queen's College, and Student of the Inner Temple, died at Oxford on the 13th ult., aged 26. Others have borne witness to those qualities which specially endeared him to friends and pupils, and to those which led good judges to predict for him extraordinary professional success: we ourselves are more immediately concerned with the loss which his early death inflicts on the cause of knowledge. His powers were immensely varied, and he could direct them at will with equal effect to matters of practice, of imagination, and of science. After a brilliant University career, however, he gave himself up almost wholly to historical and legal study, going by preference, it appeared, into obscure and outlying regions where access was difficult. During the five years which elapsed between his bachelor's degree and his death he had amassed a probably unrivalled store of learning in two subjects—the history of the English Universities, and the political and legal history of the Commonwealth. He died before he had had time to do more than acquire. His extraordinary knowledge of the pamphlet-literature of the last two centuries is, for us, almost resultless. A number of MS. notes, a few articles and short papers, themselves so compressed in form as to be for the most part little more than notes, contain all that is left to us of a first-rate mind. Such as they are, however, they are of great value, whether as aids to future historians, or as indications of what he might have done if he had lived longer. During 1867 he published in the *Oxford Undergraduates' Journal* a series of elaborate papers on "The University of Oxford from 1650-1750;" and from time to time sent notes on curious points of University history. In *Macmillan's Magazine* he published "Commemoration during the Last Century" (Jan. 1868), a condensed treatise rather than an article; a paper, "The Nonconformist at Oxford, by a Junior Fellow," in the *Theological Review* (Oct. 1868); and, the result of personal observation, "Anecdotes of the London Poor," in *Macmillan* (Sept. 1869). He read before the Juridical Society in 1869 a paper on "Anticipations under the Commonwealth of Changes in the Law" (see *Academy*, vol. i. p. 135); another on "The Law Relating to Suicides;" and had collected materials for more. At Clifton, in 1868, he gave a course of lectures on the English Revolution, and published one, of local as well as general interest, on "The Two Sieges of Bristol." Lastly, in our own columns, he wrote reviews of Wellington's *Historical Notices of Events chiefly in the Reign of Charles I.* (vol. i. p. 186); of Baker's *History of St. John's College, Cambridge* (ib. p. 219); of Markham's *The Great Lord Fairfax* (vol. ii. p. 18), Spedding's *Life and Letters of Bacon* in the present number, &c. His MSS. have not yet been put in order: we shall hope to notice them at a future time.

Contents of the Journals.

Von Sybel's historische Zeitschrift, viertes Heft, 1870.—Weil describes some recent additions to the literature of the history of the Crusades, especially the Armenian documents in the *Recueil des Historiens des Croisades*, published by the French Académie des Inscriptions et Belles-Lettres. The Armenian documents unfortunately are of rather slender authority, popular lays, religious discourses, general panegyrics forming part of them. Even the chronicle of Matthew of Edessa is full of myths, *e. g.* as to the complete conquest of Palestine by the Emperor John Tzimisces. It is needless to say that the numbers in the battles are hopelessly large in hundreds of thousands, or that the Armenians and the Franks charge each other with the most faithless conduct. But some of the authorities are of considerable value for the interior history of Armenia. There is also a notice of Riezler's and Fischer's excellent monographs on the Crusade of Frederic Barbarossa.—Scheffer-Boichorst goes fully into the question of the forged Malespini history of Florence, which is merely an inadequate abridgment of Villani. This is shown by a comparison of the original sources and the differing modes of expression. The additions show the object of the work; they are all meant to glorify certain of the great families of Florence. What Livy says of some Roman chroniclers is true as a general canon of historical inquiry (viii. 40): "Familiae ad se quaeque famam rerum gestarum honorumque fallenti mendacio trahunt, inde certe et singulorum gesta et publica monumenta rerum confusa."—Schaefer describes the origin of the Seven Years' War on the authority of the Austrian archives, in a review of von Arneth's *Maria Theresia*. Many fresh details are given, but the general impression left by the usual account is not materially altered.

Götting. gelehrte Anz.—Nov. 9: Waitz discusses the view of Scheffer-Boichorst, that a lost book, the Annals of Paderborn, formed the basis of later annuals of North Germany, and points out that the theory is pushed much too far, though a certain amount of connection is established.—Nov. 16: Wachsmuth reviews Oncken's book on the Politics of Aristotle (part 1) and argues against his view of Plato's Laws (that only the latter part is genuine), and against the theory (reference should be made to Grote) that the account of Lycurgus having divided the lands of Sparta equally is a romance only, dating from the times of the reforming kings Agis and Cleomenes.—Nov. 23: Contains a notice of Peter's War of the Great Elector with France, 1672-5. He fought for the independence of the Netherlands against Louis XIV.: and the war in Alsace affords some curious parallels with later events. Austria, as usual, played North Germany false.—Nov. 30: A review, by Geiger, of Krabbe's David Chytraeus, points out that the eminent Lutheran theologian of Rostock, a pupil of Melanchthon's (his History of the Augsburg Confession is well known), rendered considerable service to the history of North Germany. The evidences of this are well put together.

Centralblatt.—Nov. 19: A review of Freytag's Tiberius and Tacitus, discusses the question as to the sources whence Tacitus may have derived his information, *e. g.* from letters or memoirs of Sallustius Crispus, the confident of Tiberius, or Vitellius, the confident of Claudius. The idea that Tacitus is writing "dramatically," or "following some malicious romance," must be rejected. An appreciative notice follows of Brentano's History and Development of Guilds and Origin of Trades' Unions (already reviewed in the *Academy*).—Nov. 26: An analysis is given of the 4th volume of the Scriptores rerum Prussicarum.—Dec. 3: Contains an account of the Codice Diplomatico delle colonie Tauro-liguri durante la Signoria dell' Ufficio di S. Giorgio (1453-1475), fasc. 3, Genova.

Oriental and Comparative Philology.

Travels in Arabia, by A. von Wrede. [*Adolf von Wrede's Reise in Hadhramaut, Beled Beny 'Yssà und Beled el Hadschar*. Herausgegeben, mit einer Einleitung, Anmerkungen und Erklärung der Inschrift von 'Obne versehen, von Heinrich Freiherr von Maltzan. Nebst Karte und Facsimile der Inschrift von 'Obne.] Braunschweig, 1870.

The publication of Wrede's travels by Herr von Maltzan deserves more than ordinary thanks. The narrative was within an ace of being lost altogether. In spite of the good opinion of Fresnel and Ritter, Wrede was unable to find a publisher for his work in Germany. He hoped to be more successful in England, and placed his papers in the hands of a translator, in whose house all his drawings and maps were lost. Thereupon he seems to have given up his last hopes of publication. He himself went to Texas, where he probably died; the manuscript seems to have been left behind in Europe. Not long since it came by a happy chance into the possession of the editor.

Whether that simplicity and that love of truth, which we value so highly in Wrede's book, deserted him in his conversation, I cannot undertake to say, but it is certain that many of his countrymen regarded him as an impostor, and spoke of his "story-telling" (*Aufschneidereien*). So far as we can make his acquaintance from his narrative, this judgment was in the highest degree unfair, and Wrede deserved a better reception. His journey to Hadhramaut was full of hazard, and though he only half succeeded in executing his intention, he has considerably extended our knowledge of this part of Arabia. His statements are unadorned; his one aim is to relate what he has seen, not what may amuse the reader, and his topographical notices are so accurate, that von Maltzan has been able by their means to reproduce the missing map.

Herr von Maltzan has thought it necessary to subjoin notes, consisting for the most part of etymological explanations of the proper names. He probably did this in order to show (comp. p. 5 of the introduction) that the meaning of the names agrees in general with the topographical character of the places. And since Wrede was no learned etymologist, it would follow that the names cannot possibly have been forged, unless we endow him with a supernatural "gift of divination." Still I venture to think that the editor might have spared himself this trouble. The explanation of proper names, even if the reading is certain, is always a hazardous thing. But the form in which the names are given by Wrede is frequently inexact, and von Maltzan has not sufficiently attended to this. Hence by following Wrede too closely he has invented a new word, غبابة (*rhobâba*), "eine Art Altviole" (note 93, p. 283). The reading should be رباب (*rebâb*), pronounced also by Wallin in the *Journal of the Royal Geographical Society*, vol. xxiv. p. 147, *rubâba*. The two angels of death are named by him (note 165, p. 291) منقر (*monqir*) and نقر (*naqr*). The true reading is منكر (*monkar*), and نكير (*nakîr*), &c. These are not the only notes which bear marks of haste on the part of the editor. On page 283, note 92, he says he has nowhere read of the red hair of Qodâr; yet this was not difficult to find. And in the version of a passage in Jacut (p. 288, note 132) we read "that at that very time an enormous number of unbelievers had died." The Arabic is عظيم من عظماء الكفار, "one of the chiefs of the unbelievers." Here is another specimen: "according to Abbas (the third Chalyf) the souls of the faithful are in a clear water-tower (*in einer reinen Wasserburg*, literally Aquarium) in the land of Syria." The Arabic is وعن ابن عباس ان ارواح المومنين با لجابية من ارض الشام, "according to Ibn Abbâs the souls of the faithful are in Djâbia in Syria." Djâbia is the well-known headquarters of Omar (see my *Mémoire sur la conquête de la Syrie*, p. 111). How Herr von Maltzan comes to make Ibn Abbâs (or Abbâs), a khalif, I cannot think. Lastly, the rendering, "Then I thought of that man of the people of the books (Christian or Jew), who declares," should rather be, "Thereupon I turned to a Christian (or a Jew), who said to me." A worse error occurs on page 289, note 141, where another passage of Jacut is altogether mistranslated. We are told, "Ibn Hâyik says, Schabwe was a city of the Himyarites, and when these made war on the Madshidsch, the people emigrated, and after them men of Hadhramaut dwelt there, and from them the city was first named Schibâm." The correct rendering is, ". . . . and established themselves in Hadhramaut, and Shibâm was so called after them." The editor draws the mistaken inference that Shabwa and Shibâm are identical, whereas the former lies much to the west of the latter on the high road from Hadhramaut to Mekka. See Sprenger's *Post- und Reiserouten*, p. 140, where by a mistake the name is given as شنوة (*Shanwa*). (Another place there mentioned by Sprenger is الجريمة; probably the same as the Choraybe (الخريبة) of Wrede, who describes it as the most beautiful place in the whole country, p. 207). According to Jacut, Shabwa is much older than Shibâm, which was founded by colonists from the former place. Whether the identification of Shibâm with the Sabota of the ancients can be defended any longer is very questionable.

The discussion of the Himyaritic inscriptions I would rather resign to more competent critics. But I cannot help adding a few remarks on a book which is involuntarily suggested by the perusal of a new work on Arabia. I mean the well-known narrative of Mr. Palgrave, which is still wrapped in a veil detrimental to scientific progress.

When we see how constantly Mr. Palgrave falls foul of Lamartine's travels (Herr von Maltzan does the same to the *Mystères du Désert par Hadj Abd el Hamid Bey*), we naturally expect that he will abstain from all romance or exaggeration and from arranging his facts with a view to effect. And yet his book contains a history of the Wahhâbites which completely disagrees in the main points (see my own essay in *De Gids*, 1866, pp. 249-277) with what we know from other sources, and is seen, when carefully examined, to be a mere historical romance. He asserts first of all that he gives the narrative in its simplicity, as he heard it from the natives, and yet he tells us further on that he made use of a manuscript history of the Wahhâbite rule in the house of the minister Maḥboob. Now it is almost incredible that such a distorted

notion of facts should have been current in Nedjd in 1862, and that not only among the lower classes, but even among the principal men, some of whom had been eyewitnesses of the tragic events of 1818. If Mr. Palgrave maintains that, in spite of its internal improbability, his account is in the main correct, he surely ought to have pointed out where and by what means Corancé, Burckhardt, Jomard, and Mengin were led astray. Instead of this, he ignores them. Neither in the seven years, during which he prepared himself for his journey, nor yet after his return has he made himself at all acquainted with what had been written on Central Arabia forty years before. This, I think, proves a want of earnestness in Mr. Palgrave. It was the great merit of men like Niebuhr and Burckhardt that they went through preliminary studies, so as to find out which points were most deserving of attention, that they possessed a strict love of truth, and communicated their results with sobriety. How can Mr. Palgrave expect us to credit his superficial assurances as to the traces of ancient Arabian religion, not only among the Bedouins, but even in the heart of Arabia, unless he informs us of those points of detail which he ought to be acquainted with in order to make such assertions? He seems scarcely to have remarked that this is a point, on which even the smallest fact deserves to be mentioned. If it be unfair to Mr. Palgrave to place him at most on a level with M. Du Chaillu, it is his own fault. It is not a bad thing to write an amusing book, but one need not imperil one's life in Central Arabia for that purpose. If Mr. Palgrave has set before himself a higher aim than to win popularity, he must give better proof of his competence. To incite him to do this, is the principal object with which I have taken this opportunity of recurring to his narrative. M. J. DE GOEJE.

The Divans of the six Ancient Arabic Poets Ennābiga, 'Antara, Tharafa, Zuhair, 'Alqama, and Imruulqais; chiefly according to the MSS. of Paris, Gotha, and Leyden; and the Collection of their Fragments, with a List of the various Readings of the Text. Edited by W. Ahlwardt, Prof. of Oriental Languages at the University of Greifswald. London: Trübner and Co., 1870.

No branch of Arabic literature has received more attention from the Arabs themselves than the remains of their ancient poetry; and to us Europeans an intimate acquaintance with these remains, both linguistically and historically, is absolutely essential, if we would thoroughly understand the writings of this people in almost any department of study and inquiry. The native historian finds a large portion of his materials for the earlier history of his race in the songs of the bards; the geographer turns to the same source of information when he treats of Arabia and Syria; the philosopher draws most of his scanty information regarding the religious views of "the time of ignorance" from the scattered verses of pre-Islamic poets; and the lexicographer and commentator on the Ḳor'ān often cite them to prove the meaning of a word or to illustrate a rare form or construction.

The older grammarians in particular devoted themselves with earnest zeal to the collection and exposition of the works of the ancient poets. Some brought together the poems of a single individual, such as Laḳīṭ ibn Zurārah, Ḥātim al-Ṭā'ī, or 'Orwah ibn al-Ward; others those of a particular tribe, as the Banū Hudhail. Some published collections of entire ḳasīdas, such as the *Mu'allaḳāt*, the *Mufaḍḍalīyāt*, and the *Jamharat Ash'ār al-'Arab*; others compiled anthologies, like the rival *Ḥamāsas* of Al-Buḥturī and Abū Tammām. Six of the ancient poets, however, by general consent, bore away the palm from all competitors, viz. Imru'u 'l-Ḳais, Al-Nābighah al-Dhubyānī, 'Antarah, Ṭarafah, Zuhair, and 'Alḳamah. Their ballads were collected at an early period into one corpus, and are generally known by the title of *Ash'ār al-Sittah*, or "The Poems of the Six."

Of this important work there was as yet no complete edition to be had. De Sacy and others had given selections from it; de Slane had edited the poems of Imru'u 'l-Ḳais, Derenbourg those of Al-Nābighah, and Socin of 'Alḳamah; but still every scholar who took an interest in Arabian poetry, or wished to dive deeply into the writings of the grammarians, was obliged to copy this and similar collections from whatever MSS. he could most easily obtain access to. The undersigned knows his own labours of this kind at Leyden, Oxford, and London, and is consequently in a position to appreciate those of other students.

We are therefore deeply indebted to Dr. Ahlwardt for his compact edition of "The Six Poets." He has given us a text, fully and carefully vocalised, according to ten good MSS.; a collection of various readings, gathered from about twenty other works in manuscript, as well as from various printed books; and some other helps towards the criticism and appreciation of the poems. What we sorely miss, however, is an index of the names of persons and places which occur in them. This would have added but little to the editor's labour, or to the cost of the volume, whilst it would have been of great use to the reader.

Into the criticism of particular passages we cannot here enter; but we may remark that Dr. Ahlwardt seems to us to have followed the MSS. too slavishly in some respects, especially in regard to the insertion or omission of *hamzah*. It can hardly be right to print أُمَيمة in the first half of a verse, and اقاسيه in the second; بايب in one line, and كتايب in another; here كَأَنِّي, but in the preceding verse أووب; in one line والقى, and soon after وأعجبني. Hence, too, the mistake of writing القاتلين (page ٣٤١) instead of القاتلين.

For Dr. Ahlwardt's successors in the study of these poems there still remains much to do. The difficulties which the interpretation of them presents can scarcely be surmounted without the publication of at least one of the commentaries extant in manuscript; and a glossary, or even a concordance, exhibiting all the words that occur in them, and all the passages in which each word is found, would be a great boon to lexicographers.

We regret that Dr. Ahlwardt did not print his preface in German instead of English, as it has not been very well rendered into our language. The translation abounds in Germanisms, and there are some positive errors in it. "A deaf nut" (p. ix), for example, is not the English equivalent of "eine taube Nuss" ("an empty nut," or "a blind nut"); and no one who is unacquainted with German could guess what was meant by "a diffuse and mainly real commentary" (p. xxvi). W. WRIGHT.

Intelligence.

Recent Additions to the India Office Library.—From the government of the Khedive upwards of a hundred volumes of *Arabic* works printed at Búláḳ have been received. Of these, the following may be specially noticed: the Ḳorán commentaries of Abu Sa'úd, al-Zamakhshari, al-Jalálain; the collection of traditions about Muhammad by al-Bukhári, also al-Ḳastaláni's commentary upon it, and al-Zarḳáni's commentary on the latter;—Ghazzáli's Ihyá 'ulúm id-dín, Ḳushairí's Risálah on Súfism;—al-Damírí's Zoological Dictionary, the Ḥayát ul ḥaiwán;—Ibn Khaldún's great historical work, the Kitáb ul 'abar,—al-Soyúṭí's

Muzhir,—Jauharí's Arabic lexicon, the Ṣiḥáḥ,—al-Kutubí's supplement to Ibn Khallikan's biographical dictionary, and the celebrated Kitáb ul aghání.

The India Office Library annually receives from India a copy of each of the publications registered under Act XXV. of 1867. The following recent arrivals may be of interest to Oriental scholars. In *Arabic:* Shaháb-ud-dín's Táríkh-i-Taimúrí (Lahore), Shaikh Jalál-ud-dín's Táríkh-i-Khulafá (Lahore), the Ṣaḥíḥ of al-Bukhárí w. comm. (Míraṭh), the Ṣaḥíḥ of Muslim w. comm. (Lahore), Tirmizí (Lahore), the Ḳorán commentary of the Jalálain (Míraṭh); in *Persian*: Tohfat-ul-'Iráḳain (Lahore), Muntakhab-ut-tewáríkh, by Badáoní (Lucknow), Akbarnámah (Lucknow), Aín-i-Akbarí (Lucknow). In *Sanskrit* (Telugu and Grantha character): Ten Upanishads with the commentaries of S'ankara and Râmânuja, the Brahmasûtras with do., the Mahâbhârata with commentary, the Râmâyana with the commentaries of Mahes'atîrtha and Govindarâja, another edition of Books I.–VI. with a short gloss by Vîrarâghava s'ûrin, also several editions of the text only, the Vishnupurâna with the commentaries S'rivishnuchittî and S'rîdharîya, the Bhâgavata-purâna with commentary; the philosophical works Nyâyabhâskara, Tarkasangraha, Vedântadîpa, Âtmabodhaprakâs'ika, and Yatîndramatadîpikâ; the Chandrâloka, Kuvalayânanda, and Pratâparudrîya; the Vrittaratnâkara, the Sangîta sarvârtha sâra sangraha; the Siddhântakaumudî; Vâsavadattâ, Kâdambarî, S'ankaravijaya, Vikramârkacharitra, Murârinâṭaka. In Nagari and Bengali character: the Chhandomanjarî and Vrittaratnâkara; the Vais'eshikadars'ana with the Bhâradvâjavrittibhâshya; Charaka, Sus'ruta, and Vâgbhaṭṭa; Târanâtha's new edition of the Siddhântakaumudî; new editions of the dramas Mrichchhakaṭî, S'akuntalâ, Vikramorvas'î, Mâlavikâgnimitra, Uttararâmacharita, Mâlatîmâdhava, Venîsamhâra, Mudrârâkshasa, all with commentaries; also the Ritusanhâra, with a commentary by Pandit Manirâma S'arman. Further instalments of new editions of the Râmâyana, Mahâbhârata, Vishnupurâna, Matsyapurâna, Dâyabhâya, Raghuvans'a, Kumârasambhava, S'is'upâlabadha, Kirâtârjunîya, and Das'akumâracharita, now in course of publication. As a curiosity may be mentioned a new edition of the Vajrasûchi, in Sanskrit and Malayâlma. Lastly, the Muktikopanishad has been brought out by Bâbu Bhuvanachandra Vasâka, as a first instalment of a collective edition of the 108 Upanishads of which the Muktikâ is the last. Brief notes accompany the text in those pages (4–10), in which the list of Upanishads is given.

The Batavian Society for Arts and Sciences has distributed printed copies of some inscriptions on brass plates in the so-called Kawi language. Professor Kern, in his report to the Royal Academy at Amsterdam, states that they are written in the same language as the old Javanese poems, and that the name of Kawi (abbreviated from Tembung-Kawi, *i.e.* poetical language) is inaccurate, the correct designation being "old Javanese." It seems, however, that the Javanese of the present day has not sprung from this language. It is rather the Soerakarta dialect, whilst the old Javanese is probably the dialect of Madjapahit. The inscriptions consist of decrees of various ages. In the oldest of them, bearing the date 840 A.D., we find enumerated the privileges granted to the district of Waharu Kuṭi, with the usual anathemas against offenders. Some extremely corrupt Sanskrit verses are quoted in the same document. Professor Kern remarked on the importance of such a collection of dated inscriptions for the historical study of the language, and concluded with the proposition that the Academy should issue an edition of them with translation and glossary. The Academy of Amsterdam has agreed to this, unless it should appear that the Batavian Society itself wishes to undertake the task.

A pamphlet on the Moabite Stone by Prof. Kaempf, of Prague, has just reached us; but as the author's critical apparatus is imperfect, and many of his conjectures have been anticipated by other scholars, a brief notice will be sufficient. Korḥah is supposed to be a northern quarter of Dibhon, and derived from קרח, "frost;" the southern being called Dibhon from דוב or דיב, "to melt." The lacuna in lines 4 and 5 is supplied thus: עמד בן ישז מלך ישראל or עבר. This is ingenious; but the interval between Solomon and Omri in l. 7 is too great. L. 6 is read [בימי אמרתי], "in the days of my dominion," which is entirely inadmissible. L. 8 is rendered, "And he dwelt in it [till his death, and after him] his son 40 years," a round number for the 22 years of Ahab's reign. In l. 25 Prof. K. reads [באגרי את] ישראל, and translates "after having expelled the Israelites;" but אבד does not mean "to expel," and there is no room for את. L. 27 is read thus: סי עזרני אזש דיבן "for armed men from Dibon supported me." But, as we have remarked before, the three כי require three separate phrases. The historical introduction prefixed is interesting, though we cannot admit that any conclusion as to the word שלכן can be drawn from a passage in a Midrash, cited by Prof. K. on p. 17. The interpretations of the Aggadist are free, and are not based on any historical fact. An appendix of 6 pages is given on the inscription of Eshmunazar.

Dr. Wright has accepted the Professorship of Arabic at Cambridge.

Classical and Modern Philology.

Pronunciation, Vocalism, and Accentuation of Latin. [*Ueber Aussprache, Vokalismus und Betonung der lateinischen Sprache.*] Von der königlichen Academie der Wissenschaften zu Berlin gekrönte Preisschrift von W. Corssen. Zweite umgearbeitete Ausgabe. Erster Band. Leipzig: Teubner, 1868.

The subject of the present work is the thesis given for the prize essay of the philosophical class by the Royal Prussian Academy of Sciences at Berlin in 1854. The wording of the thesis itself, somewhat lengthy and vague,* was reduced to clearness and method by Corssen's treatment, which follows the order marked out in the title above quoted. His first edition, in two vols. (1857), was the successful prize essay; an important work, which at once attracted the attention of scholars who were working in the field of Latin philology. The facts were patiently gathered, and the conclusions, generally distinguished by tact and sense, were carefully worked out, clearly stated, and not easily impugnable on important points. Neither the author, nor perhaps any one else, could at that time have anticipated such an enormous addition to the materials for his work, as the second edition reveals to be the result of his own and other scholars' researches during the following eleven years. In the present book the former one is rather rewritten than newly edited. The new edition is in fact the summary of the contributions of an unusually active decennium of general and special philological research to the criticism of Latin. Between 1857 and 1868 Latin philology has been enriched from many sides. The study of the Italian dialects has been illustrated by the discovery of a number of documents: an Oscan inscription on a sun-dial at Pompeii, a lead plate found at Capua, a shrine of Herakles at Mersa, a tablet found at Pietrabbondante on the site of the ancient Bovianum, and some other Oscan relics; as well as the Sabellian inscriptions of Sulmo and Navelli between Peltunium and Aufinum in the territory of the Vestini. The existence of a separate Faliscan dialect, considered to stand to old Latin in much the same relation as Anglo-Saxon stood to old Saxon, has been proved by an inscription found at Falerii, and treated by Garrucci and Mommsen. The first volume of the new *Corpus Inscriptionum* embodies in a more trustworthy form than any preceding collection the contemporary monuments of Latin writing down to the death of Cæsar. Mommsen's edition of the *Monumentum Ancyranum*, Brambach's *Corpus Inscriptionum Rhenanarum*, and some treatises of less compass, have contributed to a more exact knowledge of the writing of the Augustan age. The later popular Latin dialect has been newly illustrated by de Rossi's *Inscriptiones Christianae Urbis Romanae*, Renier's *Inscriptions Romaines de l'Algérie*, and Le Blant's *Inscriptions Chrétiennes de la Gaule*. Corssen also acknowledges the merits of Schuchardt's important work *Der Vokalismus des Vulgärlateins*, though not always admitting the author's accuracy or agreeing with his results. In the domain of comparative philology there have appeared the second edition of Pott's *Etymologische Forschungen*, with the first instalment of a *Wurzel-Lexicon der indogermanischen Sprachen*, the second edition of G. Curtius' *Grundzüge der griechischen Etymologie*, Schleicher's *Compendium der vergleichenden Grammatik der indogermanischen Sprachen*, and Corssen's own *Kritische Beiträge* and *Kritische Nachträge zur lateinischen Formenlehre*, the results of which have been worked up in the present book. Finally, the investigations of physical observers into the laws which govern the formation of vocal sounds, have been to a certain extent made use of. Here Corssen is chiefly indebted to Brücke's *Physiologie und Systematik der Sprachlehre*, Helmholtz's *Lehre von den Tonempfindungen*, and Max Müller's second series of *Lectures on the Science of Language*: he might, perhaps, have noticed the remarkable work of Mr. Melville Bell on *Visible Speech*, of which a high authority, Mr. A. J. Ellis, declared that it did more than any work with which he was acquainted towards laying the foundations of alphabetic science (*Reader*, August 5, 1865).

The history and general treatment of the "pronunciation, vocalism, and accentuation" of a language might seem at first sight to concern merely the form of the language in its more limited sense, not necessarily its structural development. Empirical and superficial as such a view of the subject would have been, it would not, it must be owned, have been altogether inadmissible on the loose terms of the thesis as given out by the Berlin Academy. It is fortunate for Latin scholarship that Corssen preferred never to leave out of sight the whole history and etymological affinities of the letter or syllable which he was treating. By widening and deepening his range in the manner indicated, he has given his book an interest and scope much exceeding the apparent limits of his subject, and has projected a work, the compass of which must cover the whole range of Latin etymology, grammar, and orthography. The bearings of the treatise on etymology and grammar constitute, in fact, by far the largest element in its importance and interest. It might, perhaps, have been wished that the material collected could have been presented in a form different from that imposed by the exigencies of a prize essay; and we cannot refrain from expressing a hope that, for the purposes of general convenience, the author will one day reduce the etymological results of his labours into a lexicon-form resembling that adopted by Curtius in his *Grundzüge der griechischen Etymologie*.

The first volume (792 pp.) covers the section upon pronunciation, and rather more than a third of that upon vocalism, or, as it may perhaps be paraphrased, the pathology of vowels. A short article cannot do justice in any but general terms to the patience and general thoroughness of the author's labours. As we have said, the present edition has in the first section, as everywhere else, completely transformed the first. The account of each letter is prefaced by a statement of the physical conditions under which the sound represented is produced, and where possible this analysis is brought into harmony with the *dicta* of the Roman grammarians on the letter. The discussion, clear, patient, and well supported by reference to authorities, is invariably well summed up. The chief change of view exhibited by the author in this section lies in his present comparative disbelief in the disappearance of mutes as a cause of change in form; a result for which he had prepared his readers in the *Kritische Nachträge*. Among the best and newest things to be found here are the discussion on *af*, *ab*, and *au* (p. 152 foll.), in which *ab* is shewn to be distinct from forms previously supposed to be akin to it; the section on the affinities of *f* (p. 140 foll.) and the account of the transition from the third to the fifth declension in the case of the *es* stems (p. 281 foll.). There are, however, some points in this division which seem obviously open to criticism.

The statement (p. 175) that *annis* in *quotannis* is an old nominative, though retracted as unnecessary in the corrections added at the end of vol. ii., should not have been

* A sample may be quoted in illustration: "Hierbei sollen die Etymologie, die Zeugnisse der Alten selbst, die verschiedenen Schreibweisen in Inschriften und Handschriften, die Formen, welche die lateinischen Wörter in der Uebertragung ins Griechische erhalten haben, die altitalischen Dialekte, und die aus dem Lateinischen stammenden neueren Sprachen benutzt werden, endlich besonders die altrömischen Dichtungen, vorzüglich die Komödien;" hardly a model of arrangement.

made without an acknowledgment of the existence of the expressions "quot Kalendis," "quot mensibus," which entirely refutes it. This is an instance of the tendency to forget or ignore the living usages of a language which is so often induced by the exclusive study of its formation. It seems again very unnatural to say with the author (p. 213) that *iani-tor* stands for *iani-tuus*. If so, why have we not a form *aedi-tor* by the side of *aedi-tuus*? Corssen argues on the form *aedi-tos*, said to be the original one by Varro *L. L.* 7, 27. This form may have been due to the analogy of words like *honos*, *labos*, &c., which weakened their *s* to *r* in the nominative, as well as in the oblique cases. *Tos* may have been, as Corssen says, short for a consonantal stem *tu-os*; but it should have been first proved that such a contraction was possible or likely in a suffix. In the controversy with Pott on *nocturnus* and *diurnus* (p. 232 *note*), the author seems to strain a point for the sake of uniformity. He maintains that *diurnus* stands for *dius-nus*, as *veternus* stands for *vetusnus*, and insists in finding the same stem *dius*, shorn of its *s* in the adverbs *interdiu* and *diu*, which he maintains to be accusatives. *Hodiernus* must surely be from *hodie*, an unmistakeable ablative; the case of *nocturnus* and *diurnus* is not beyond dispute. But, in spite of Corssen's arguments, Pott seems to us to take the most natural view in supposing them to be formed, like *hodiernus*, from ablatives, and to be therefore distinct from formations like *veternus* and *infernus*. *Noctu* points back to an old stem *noctu*, of which a relic is left in *noctu-a*. If *diu* be an ablative, then *inter* in *interdiu* must once have governed the ablative; and it is easier to believe that it did so in this word and in *interea* (see Ritschl, *Neue Plautinische Excurse*, p. 82 foll.) than to suppose with Corssen that *diu* (in face of its final syllable) is an accusative with the *s* lost, and that the *eā* of *interea* is a neuter accusative plural with the original length of its final syllable preserved. To account, as Corssen does, for the length of the last syllable of *diu* by assuming an original stem *divas*, whose final syllable could be either short or long, is somewhat arbitrary.

The second section, on vocalism, is in this edition as in the last the most important part of the work. Here the most important alteration in the author's views lies in the enlargement of the sphere which he is now disposed to allow to the action of "Vokalsteigerung," or the strengthening of vowels in Latin by the processes known in Sanskrit grammar as *Guna* and *Vriddhi*. This process Corssen believes to have been active in the formation and modification not only of stems but of suffixes; a theory most suggestive and important as tending to simplify many of the more puzzling phenomena of Latin grammar. The pages in which the action of vowel-strengthening on suffixes is treated (pp. 566-627) are especially worth study, and not least the discussion of the Latin perfect (pp. 607-20), which may be favourably contrasted with Schleicher's treatment of the same tense. Corssen gives up, in face of the number of facts, any attempt to give a precise theory of the origin of the multitudinous process to which he ascribes such extensive working. Bopp's theory of a law of compensating gravity in syllables, according to which a light suffix was supposed to be balanced by a heavy stem, and a heavy suffix by a light stem, was as broad and clear as theories started by great minds generally are; but it is now found to be inadequate to the facts.

The second division of this part, on the disfigurement or spoiling ("Trübung") of the diphthongs, contains much important discussion on grammatical points. The treatment of the Latin dative and ablative (p. 726 foll.) is extremely good; but the weightiest result to which we are brought in this section is the giving up of the supposed archaic genitive of the first declension in *aes* or *ais*. Corssen thinks it can be proved that these genitives are no genuine Latin forms, but that they arose under Greek influence; being in fact imitations of the Greek genitive in ης. The ending *aes* is found mostly in proper names; many of these names are Greek; in many cases the person who wrote the inscription was a Greek; several are the names of slaves or freedwomen, presumably Greek. The form *Prosepnais*, usually relied upon as the best, because the oldest, evidence of this genitive, Corssen now follows Mommsen in pronouncing to be a bastard compound of the Greek genitive in ης and the Latin genitive in *ai*. If the genitive in *aes* be given up as a true Latin form, it follows that the older genitive in *as* (familias) can no longer be identified with that in *ai*, the only proveable link between them having disappeared. It is not, therefore, surprising that Corssen (p. 769) should return to the view that the genitive in *ai* is properly a locative. Equally important is Corssen's theory that the old plurals of the second declension in *eis* and *is* are due to a confusion of declension; that forms like *vireis* for *viri* are in fact cases of a transference of an *ŏ* stem into the *i* declension. This theory, if made good, would deprive the Latin declension system of the symmetry which has hitherto been supposed to characterize it. H. Nettleship.

Greek Syntax, with a *Rationale* of the Constructions, by James Clyde, M.A., LL.D. Fourth edition, re-written. Edinburgh: Oliver and Boyd.

From a brilliant sketch of Greek syntax, Mr. Clyde's work has grown into a complete and systematic treatise, and that without degenerating into mere bulkiness. Its chief merits are, logical subtlety, and a wide range of illustration from other languages. Like most of his countrymen, Mr. Clyde shows a strong leaning to the psychological or deductive method. He starts from the pregnant axioms that the rules of syntax are ultimately based on the principles of logic; that "there are more forms of the mental act than" corresponding forms in syntax, so that "language cannot always render fully or keep pace with thought;" and that the expression of thought in language is determined by a series of influences —emotion, the desire of euphony, national temper, and the like—which vary in each several case. His manner of applying these principles is always full of thoughtful research: and he is often strikingly successful in carrying the light of reason into the intricate windings of grammatical usage. Nor is this attained by sacrificing facts. Mr. Clyde has a thorough critical acquaintance with the Greek of every period, not excepting the living dialects; and he gives abundant parallels from Latin and modern languages. Indeed, his book is almost a comparative syntax based upon Greek. His weak point is etymology, or rather the quotations on that subject, which he has admitted, sparingly and with evident misgiving, from other writers. The theories of Dr. Donaldson (p. 8), and Mr. Crosby (pp. 26, 50, &c.), are as obsolete as judicial astrology. D. B. Monro.

Fragmenta Aristotelis. Collegit disposuit illustravit Aemilius Heitz in gymnasio Argentoratensi litt. ant. professor. Paris: Fermin Didot, 1869. (Vol. IV. of Didot's Aristotle.)

When we reflect on the mass of extant writings bearing Aristotle's name, fragments testifying to the existence of a body of Aristotelian literature, now lost to us, may well excite surprise and mistrust. It is natural to ask, How could so much have been produced in the sixty-three years of one man's lifetime? A probable solution of the difficulty is to suppose that a large portion of that which in antiquity passed as Aristotle's was due to the school of Aristotle rather

than to the master himself, just as in our time some nameless imitator may be credited with a picture which the art-critics of the last century assigned without hesitation to Rafael or Lionardo. This view substantially coincides with that maintained by Val. Rose in his essay *De Aristotelis librorum ordine et auctoritate* (Berl. 1854), but we cannot help thinking that negative criticism may be carried too far, and that Rose errs in this direction in prefixing the title of *Aristoteles pseudepigraphus* to his well-known collection of the Aristotelian fragments. The *Verlorene Schriften des Aristoteles* (Leipz. 1865) of M. Heitz, of Strassburg, was a seasonable protest against this somewhat indiscriminate spirit of condemnation; and it was reassuring to find that so much might be said on behalf of the more conservative side of the controversy.

The present volume, though apparently based on the great work of Rose, presents traces in every page of the sound and independent judgment of one who has a right to speak with authority. Besides introducing much valuable material of his own, the editor makes good use of the more recent contributions to Aristotelian philology: in the case of the Dialogues, for instance, the importance of Bernays' admirable essay on the subject is duly recognised, although the plan of the edition precludes the mention of anything more than the results attained. M. Heitz would be the last person in the world to regard his own work as final, or to ignore the fact that something still remains to be done (more especially in the way of identifying anonymous fragments); also that we may expect a gradual improvement in the text, as the late and often obscure writers, to whom we are indebted for the preservation of fragments, come to be better known and more critically edited. We believe we are right in stating that the concluding volume of Didot's Aristotle will have the benefit of M. Heitz's editorship.

I. Bywater.

Aeschyli Persae. Ad libros MSS. de integro aut primum collatos, edidit et praefatus est R. Merkel. Leipzig: Teubner, 1869.

Italian MSS. of Aeschylus. [*Aeschylus in Italienischen Handschriften*, von R. Merkel.] Leipzig: Teubner, 1868.

These two works, by the well-known editor of Apollonius Rhodius, are different parts of one design, the restitution of the text of Aeschylus in constant subordination to the MS. tradition. They contain the results of a year's minute, almost daily, examination of the great Laurentian codex, 32.9 to which M. Merkel came with the experience gained by his previous collation of the *Argonautica*, which forms the last, as *Aeschylus* the middle, and *Sophocles* the first, part of the MS., besides a collation, less minute but evidently careful, of two at Venice, *A* and *V*, three at Milan, *x y z*, nine, with excerpts from twenty, at Rome; besides five other Laurentian, less known than the great 32.9. Many of these have hitherto remained unused; when supplemented, as M. Merkel in the preface to the *Persae* promises, by a transcript of 32.9, shortly to be issued by the Clarendon Press, they will form a *matériel* such as can scarcely fail to throw fresh life into the always interesting study of Aeschylus.

Of the two works at present under notice, the latter is at present incomplete. It is in German. After 31 pages of general description of the Laurentian and other codices, it proceeds to the text of the *Persae*, according to the pages of Laur. 32.9, giving the minutest facts of that MS., a collation of the others, and a discussion of such points of accentuation, orthography, and exegesis, as arise. Of its minuteness some idea may be formed by the fact that eight octavo pages are devoted to the 32 lines which form the first page of Laur. The edition of the *Persae* is in Latin, and follows a similar plan, but less elaborately and so as to suit the requirements of more ordinary students. It is not to be supposed from this that it includes a commentary; M. Merkel's work is that of a critic, only entering on the more practical task of interpretation when it becomes necessary as explaining an emendation, or contributing a new, generally a more recondite, view of the most obscure passages. It has the great merit of extreme conciseness; a preface of 8 pages is followed by the text in 34, and this by the critical notes in 33.

Among the more important restorations of the original text are, in 28, ἐντλήμονι; 372, ὑπ' εὐθύμου φρενὸς, for ὑπ' ἐκθύμου φρενὸς, which is only found in one of M. Merkel's MSS.; 415, αὐτοί θ' ὑπ' αὐτῶν ἐμβολαῖς χαλκοστόμοις, for αὐτῶν ἐμβόλοις, both unnecessary; 422, φυγῇ δ' ἀκόσμως, for ἀκόσμῳ; 551, τοτοῖ, for the repeated ποποῖ; 851, εὐδοκίμως στρατιὰς ἀπεφαινόμεθ', for εὐδοκίμου στρατιᾶς; 860, ἐπεύθυνον, for ἐπεύθυνεν, where M. Merkel makes νομίσματα nominative, connects πάντ' closely with πυργινὰ, like τὴν ἐναντίαν πᾶσαν ὁδὸν, and explains ἐπεύθυνον of the direction under which the army marched; 926, πάνταρφύς τις, for πάνυ γὰρ φύστις, as read by Dind.; 1006, οἵᾳ δι' αἰῶνος τύχᾳ, for οἷαι τύχαι, where M. Merkel explains, perhaps questionably, *quali umquam post hominum memoriam re adversa;* at any rate the usual sense of "everlastingly" suits sufficiently well, οἵᾳ being exclamatory, "with how deep a disaster." Of the emendations proposed, ναῦς καὶ κρατῆσαι, in 338, for ναυσὶ κρατῆσαι, seems likely; βροτήσι' for βροτοῖσιν, 599, is very plausible; 281, 286, Δάοις as a proper name for δάοις is not unlikely, though the same cannot be said of οὐδέ τις ταβῶν for οὐδέ τις γέρων, 732; 761, ἐξεκίνυσσεν for ἐξεκείνωσεν is not improved by the addition of πέσος for πεσών; in 550, ὑπαντιᾶν εὐπαδὶς is more Alexandrian than Aeschylean, and M. Merkel confesses to have borrowed it from Apollonius Rhodius; ἁλιδινεῖς for ἁλὶ δεινᾷ, in 576, though not admitted into the text, is ingenious, and at least not feeble.

Those who are interested in tracing the signs by which the various divisions of an ancient drama were marked off from each other, will find various notices in these two books. Thus the *paragraph* still exists in the Laur. to mark the beginning of the antistrophe; in one case, out of its place, at 890.

R. Ellis.

Intelligence.

The collected works of Poggio are to appear shortly in 4 vols. under the editorship of Aug. Wilmanns, already known through his labours on the fragments of Varro.

Latin scholars will welcome the news that a fifth volume of Hand's Tursellinus is said to be in course of "preparation." A new edition of Tacitus by Nipperdey is in the press. (Berlin, Weidmann.)

Messrs. Teubner announce (1) a critical edition of Cornelius Nepos by Halm; (2) the orations of Antipho, together with the declamations of Gorgias, Antisthenes, and Alcidamas by Fr. Blass; (3) Cebetis tabula, with critical apparatus, &c., by Fr. Drosihn. All these, however, seem trifling by comparison with another announcement, that of an entirely new and complete edition of the Greek writers on Music, in 4 volumes. The editors will be von Jan, Deiters, and Marquard, with Prof. W. Studemund as collaborateur, who supplies a collation of the Italian MSS. The series is to begin with Aristides Quintilianus by Deiters. A German translation and (in the case of the more difficult writings) an explanatory commentary are to accompany the text, and an elaborate Lexicon terminorum will enhance the value of the work. The book certainly promises to be one of the most important philological productions of our times.

The new *Tidskrift for Philogi og Paidagogik* (Copenhagen), is not a very valuable journal: the current number, however, contains some valuable emendations by Herr Bugge.

Contents of the Journals.

Rheinisches Museum, vol. xxiv. part iv.—A. W. Zumpt: On the Lustra of the Romans. [Maintains not very satisfactorily the old view of Censorinus that there had been seventy-five lustra before Vespasian, against Borghesi's that there had been only seventy-two.]—L. Urlichs: Certain Pictures by Aristides. [Fixes his date, and gives a history of some of his works: concludes with a discussion an Pliny, N. H. xxxv. 99.]—O. Richter: Delia; a contribution to the biography of Tibullus. [Accepting Lachmann's view as to the data and order of the poems of Tibullus, maintains that Delia was a *libertina*, and a married woman even at the beginning of her liaison with the poet.]—F. Nietzsche: The Florentine Tractate on Homer and Hesiod, their family, and the contest between them.—A. Eussner: Frontonis et M. Caesaris epistularum emendationes. [Some of them are demonstrably superfluous.] E. Rohde: Inedited Scholia to Lucian, relating to the Attic Thesmophoria and Haloa. [Interesting, as illustrating the history of Greek religion.]—L. Müller: On Horace.—H. Usener: Lectiones Graecae. [Most of the suggestions seem to deserve careful attention.]—H. A. Koch: Archaic Forms in Plautus. [On *sequo*, *fariolus*, *tame*, *Herculeus*, *auxilla*, *aeriternus*, *senet*, &c.]—F. Bücheler: Sophocles in Philodemus. [On a passage in the recently published portion of the Herculanensia volumina.]—L. M.: A New Fragment of Ennius. [Ap. Isidor. Or. i. 36, 3.] —W. Schmitz: *Retiaculum*.—L. M.: *Cena*. [Orthography of the word.]—L. M.: *Dilaxat*. [For this we must read διαλλάσσων in Lucil. fr. v. 25.]—W. Clemm: Ad Scholia in Homeri Odysseam observationes criticae duae.—J. Klein: On Galen.—L. M.: On Lucilius.—G. Krüger: On Horace.—L. M.: On Acro and Porphyrio.—J. Maehly: On Ovid. —L. M.: On Ausonius.—J. Steup: On Sallust's Catiline.—A. Schöne: On the Fragments of the Histories of Sallust.—The same: On the Dialogus de Oratore.

Hermes, vol. v. part 2.—Th. Mommsen: The Two Battles of Betriacum, in A.D. 69. [Discusses Tacitus' account of them.]—M. Haupt: Varia. L. von Sybel: On the Callinicus of Archilochus and the Scholia to Pindar. [Deals with the fragment ap. Bergk, L. G. p. 716: the formula τήνελλα καλλίνικε is shown to have been fathered on Archilochus through a conjecture of Eratosthenes as to its origin.]—V. Rose: On Ion's Pictures of Travel and Joannes Alexandrinus the Physician. [On the ἐπιδημίαι of Ion of Chios and the Allusions to the Book in the Commentators on Hippocrates.]—Th. Gomperz: On Soranus of Ephesus. [Conjectures on the text.]—U. Köhler: Lycurgus' Administration of the Finances. [A discussion on the inscription relating to it.] —Th. Mommsen: On the Legends of Sp. Cassius, M. Manlius, Sp. Maelius. [Regards that of Maelius as least historical: points out some interpolations in the fasti which Livy has followed.]—R. Hercher: On certain Greek Prose Authors. [Critical suggestions on the text, with collation of MSS. of Choricius and Porphyry's Quaest. Homer.]—O. Hirschfeld: On Cicero's Letters.—The same: On Cic. de Rep. v.— J. Bernays: Aristotle and Simonides. [Corrects Pol. ii. 5 by a masterly emendation (ἔθνεσιν for ἔτεσιν), showing that the place contains a quotation from Simonides (fr. 193, Bergk) which has hitherto appeared in our collections in a curtailed form: another allusion to Simonides is pointed out in Phys. iv. 13.]—Th. Mommsen: Actors' Inscriptions. [A sort of ancient play-bill on stone.]—R. Schöne: On Greek Artists' Inscriptions.—H. Schiller: On Nero's Salutationes Imperatoriae.

Zeitschrift für die österreichischen Gymnasien, xxi. 7.—J. Ptaschnik: The leges centuriatae of 305 and 415 a. u. c. [An ingenious attempt to carry further the conclusions of Mommsen in his Römische Forschungen. Too much stress is laid upon Livy's representation of "pragmatical" details. A preliminary question might be asked, viz. have we any trustworthy evidence for the terms of laws not in force in historical times?]—L. Vielhaber: Rev. of Kraner's Caesar, 7th ed. [Laudatory.]—J. Schmidt: Rev. of the new edition of Bentley's Horace. [Interesting attempt to determine what proportion of Bentley's emendations have been universally accepted.]—R. Heinzel: Rev. of Wackernagel, Voces variae, animantium, 2nd ed. [Curious and interesting; depending too exclusively upon philologrial materials rather than those of the science of language.]—The same: Rev. of Zupitza's edition of Dietrich's Abenteuer by Albrecht von Kemenaten. [This, the 5th volume of the new Berlin Heldenbuch, contains the works of a poet of the 13th century whose importance has been only lately recognised.]

Zeitschrift für die österreichischen Gymnasien, xxi. 8.—J. Kvičala: Zur Beurtheilung der drei Thebanischen Tragoedien des Sophokles. [Disproves in detail the view of A. Schöll, who regards those tragedies as a Trilogy. Sophocles wrote the Antigone first; and Antig. 49 foll. (cf. Hygin. Fab. 242) and 900 foll. show that the poet here followed a version of the legend differing from the story of his own Œd. Tyr. and Œd. Col.] K. Schenkl: Rev. of Otto Jahn's Orator of Cicero. [Detailed review—laudatory.] W. Scherer: Rev. of Rumpelt's Das natürlische System der Sprachlaute und sein Verhältnis zu den wichtigsten Culturssprachen. [With especial reference to German grammar and orthography.]

Philologischer Anzeiger, by E. von Leutsch, II. 8, Aug. 1870.—G. Curtius: Erläuterungen. [Notes some changes in this edition. We are glad to see an English translation announced.]—E. Löfstedt: Grekisk Grammatik.—R. Westphal: Methodische Grammatik der Griech. Sprache.—B. L. Gildersleeve: Latin Grammar.—O. Ribbech: Beiträge zu der Lehre von den lateinischen Partikeln.—F. Ch. Kirchoff: Beiträge zu den Elementen der antiken Rhythmik und Grammatik. [Chiefly criticism of Westphal's account of the dactyl in logoœdic verse, with a refutation of his use of the δάκτυλοι κυκλικοί of Dionys. Hal.]— J. La Roche: Homerische Untersuchungen. [A book that shows how unexhausted the subject is.]—H. W. van der Mey: Studia Theognidea.— H. van Herwerden: Animadversiones philologicae ad Theognidem. [Supply new collations of the Codex Mutinensis.]—H. Hennig: De Iphigeniae Aulidensis forma ac condicione. [Supposes two main interpolators, besides a Byzantine and certain MS. correctors. The reviewer accepts the leading results.] C. Badham: Adhortatio ad juventutem academicam Sydneiensem. [Emendations of Thucydes—condemned, with few exceptions.]—Herculanensium voluminum quae supersunt collectio altera, t. vi. fasc. i.-iv. [Sadly fragmentary remains, chiefly of Epicurus περὶ φύσεως.]—H. Almers: Römische Schlendertage. [Travels.]

The space devoted to THEOLOGY, SCIENCE *and* PHILOSOPHY, HISTORY, *and the various branches of* PHILOLOGY, *in each month will be the same as before: whilst the department of* GENERAL LITERATURE *has been increased to more than twice its original size, and is in course of complete reorganization.*

General Literature.

ALEXANDRE DUMAS.

IN an early volume of the *Mémoires* of Alexandre Dumas we find a remark to the effect that, out of the six hundred volumes which called him author, there were only four which the most scrupulous mother need hesitate to put into the hands of her daughter. Of course, as the smaller number cannot be taken quite literally, the larger one might be only intended as approximative; but considering that eighteen or twenty volumes of memoirs alone have appeared since this announcement, the figure would be now rather an understatement than an exaggeration. In literature, as elsewhere, power is considerable in proportion to its volume as well as to its direction, and the power exercised by the author of *Monte Cristo* is of a kind which serious criticism is less likely to overrate than to undervalue. The author of any six hundred popular volumes is, *ipso facto*, a considerable man, but, unfortunately for Dumas, the question has been raised whether he is that author; whether all, or only the best, whether scarcely any, and those the worst of the whole six hundred, are by their professed author. The novelist himself owned to one assistant; his friends admit that he lent his name rather too freely in the interests of his publishers; and in the most elaborate and circumstantial attack upon his literary probity, the number of authors ancient and modern whom he is accused of defrauding reaches the respectable figure of sixty-four.

Those who are curious in such controversies will find in Quérard's *Supercheries littéraires* a full discussion of Auguste Maquet's share in *Les Trois Mousquetaires*, and of Émile Souvestre's contributions to *Anthony*, as well as of the general question how far a writer may plunder his predecessors without acknowledgment. But under the cover of his bibliographical zeal, Quérard shows, if possible, more private animosity than Eugène de Mirecourt, author of the pamphlet *Fabrique de Romans, Maison A. Dumas et Compagnie;* and if it were worth while to scrutinise all the evidence accessible, it would be easy to show that his conclusions admit of modification. But this would require a separate controversy for every one of some fifty or sixty second-rate novels and third-rate plays, and a general result reached by simpler means will be quite as trustworthy. That Dumas borrowed characters from Scott, and plots from Cooper, scenes from Goethe, and sentences from Schiller, is quite certain, and he sometimes took very little trouble to conceal his obligation. Compare the two lines:—

> "Ah! c'est un beau spectacle à ravir la pensée!"
> "Oh! que c'est un spectacle à faire envie au cœur!"

As one critic has happily remarked, "Charles Quint dit, *Ah!* et Christine dit, *Oh!*" and the speech proceeds with about the same degree of originality. But, after all, these obvious and unmistakable plagiarisms would scarcely fill one volume, to say nothing of five hundred, and they are a sign of haste and indolence on the part of the writer, much more than of absolute want of invention. M. de Mirecourt attempted to prove by calculation that it was a physical impossibility for the most practised penman to do more than copy out the number of pages which Dumas was supposed to compose in a week. This was allowing sixty pages a day to the copyist, but as Dumas published his first volume of tales in 1826, and continued to write for more than forty years, the supposed copyist, working three hundred days in the year, would produce just four times as many volumes as those claimed by the novelist. Such productiveness is therefore possible, though strange; it is scarcely even strange if we make allowance for a translation of *Jacopo Ortis* touched up and published as original, for Méry's *Chasse au Chastre* inserted without acknowledgment in the *Impressions de Voyage*, and reprinted as an independent work, for new names given to old stories, for old stories cut up into new *feuilletons*, and then served up for the third time as fresh compositions, and for all the other devices by which a practised bookmaker can turn one volume into three. The *fabrique de romans* was carried on in the face of day, and Dumas could not complain of Thackeray's ironical congratulations addressed to him in the *Revue britannique* as the inventor of the twenty-one-volume novel. But the associates in the trade were not so numerous, or their co-operation so extensive, as the author's enemies have endeavoured to make out. M. Auguste Maquet, the only *collaborateur* whom Dumas consented to acknowledge, and who served under him for some twenty years, had achieved several failures on his own account, before entering on this one-sided partnership, and only attained very moderate successes after its dissolution. He helped, no doubt, to select and arrange the historical myths which were to save his master the trouble of inventing subordinate characters for himself; he may even have been the first to discover the names of Athos, Porthos, and Aramis in Anquetil; but it by no means follows from thence that it was he who wrote Artegnan's duel with the three musketeers, and made the story of the diamonds so absorbing as to imperil the soul of one of Miss Yonge's juvenile heroes. No doubt, Dumas was well content to let those of his readers who knew no literature but their own, remain ignorant of the assistance he derived from his more varied studies, but he was personally honest, as his behaviour towards Victor Hugo proves. *Anthony*, a very worthless melodrama, had had a great success, while *Marion Delorme* was still delayed by the censorship of the press. The resemblances of character and situation were too strong to be accidental, and the critics began to talk of plagiarism; whereupon Dumas announced publicly that the plagiarism, if any, was on his side, as he had been admitted to the first reading of *Marion Delorme*, before *Anthony* was begun. Literary honesty, on the other hand, as it is now understood, only dates from the first law of copyright, and Dumas' sins against it would have been mere matters of course at an earlier period. A living literature, that is, one orally transmitted, is common property, and a thousand unknown poets may have had a hand in correcting and enlarging the barest outlines of our present nursery legends. Mediæval

romance grew up in the same manner, and it was as natural for a poet to have a school of followers as for a painter to touch up the work of his pupils; the Homeridæ are only the Auguste Maquets of an heroic age. And though it may not be altogether to the credit of the 19th century, there is something to be said for the view that the French novel is to modern Europe what Homer was to the Greeks, the *Nibelungenlied* to our ancestors, and the songs of the Troubadours to southern chivalry. From Paris to Constantinople, from St. Petersburg to Rome, Dumas and his contemporaries have extended their sway; their power is real, however earned, and however exercised. Instead of disputing the fact, it would be as well to analyze its causes, for it is scarcely conceivable that a school should owe so wide a popularity to its vices alone.

We must distinguish, to begin with, the younger generation, Feuillet, Flaubert, Droz, Dumas fils, and the rest from the generation which is now dying out, Méry, Gautier, Karr, Eugène Sue, the elder Dumas, Hugo, and Sand. The two last, who possess (and abuse) an unquestionable portion of real genius, may be considered to stand apart. Of the others, Sue is the connecting link between Dumas père and Dumas fils, between the invention which aims at nothing but to make an amusing story, and the realism which is satisfied with the narrowest view of a fraction of humanity. The tradition which forbade the novelist to be dull is perhaps losing its force, but there is a good deal of conscientious workmanship even in the new school; its members endeavour either to write immediately from experience or to follow out certain given principles or assumptions to the remotest refinements possible. It is true that their range of subject is deplorably narrow, and their real facility is somewhat mechanical, as belongs to a decadence; so that there is something to be said for the indignant ejaculation of Alexandre Dumas the first, when he couldn't find any boots to go out in, and reflected that his son had twelve pairs in an orderly row: "Décidément ce garçon-là n'aura jamais de génie." Without attributing genius to the author of *Monte Cristo*, it may readily be admitted that he had a more spontaneous, a much more varied, and a much less disagreeable talent than his successor.

His writings fall naturally into four divisions: the plays, the historical novels, other novels, and the *Mémoires*, *Impressions*, and miscellaneous *feuilletons*. From the last of these we can gather quite as much as is necessary of the author's history, while avoiding all controverted points; in the discussion of which, however, some fifty or sixty volumes might easily be spent. But if we were to attempt to correct all Dumas' own statements, in common fairness we ought as well to examine the grounds of the thousand and one apocryphal stories which circulated about him in the French press. M. de Mirecourt's scandals may be explained away quite as easily as the Homeric account of the capture of the magazines at Soissons in the *Mémoires*. The truth is generally midway between the rival versions, as in the case of Dumas' claim to the rank of marquis. His enemies denied, what was true, that he was the legitimate son of the republican general Dumas; he himself asserted, what was doubtful, that his father was the legitimate son of the Marquis Davy de la Pailleterie and the West Indian mother from whom he took the name of Dumas. The fact probably is that there had been a Scotch marriage, which might have passed muster in revolutionary times if the father and son had not quarrelled, the latter enlisting as a private soldier in the armies of the Republic, which was scarcely the way to secure an old title, nor, as his opinions remained unchanged, to earn a new one under the Empire. General Dumas died young, and as Napoleon refused a pension to his widow, their son Alexandre found himself at one-and-twenty started in life without other fortune than a particularly good handwriting. This procured him a clerk's place, and the first two or three years of his residence in Paris were spent in filling up the deficiencies in his education. In 1826 he published a volume of Tales, and soon afterwards composed his first play, *Christine*, according to the received classical models. In 1833 he wrote a paper in the *Revue des Deux Mondes*, entitled "Comment je devins auteur dramatique," to describe the revolution effected in his being by the first play of Shakespeare he saw represented; but the narrative is more eloquent than accurate. It is true that about this time he joined the so-called Romantic movement of which Victor Hugo was the head; and while *Christine* was still seeking a friendly manager, *Henri III.* was vaunted to the skies by the revolutionary clique which was nearly supreme on the French stage from 1830 to 1840. *Christine* was romanticised, and became "Stockholm, Fontainebleau et Rome, une Trilogie dramatique," still in the rhymed couplets which so easily acquire the sound of mock-heroics. *Anthony* was almost the *reductio ad absurdum* of the movement, and went a good way towards justifying Granier de Cassagnac's attack, which the paper in the *Revue des Deux Mondes* was meant to answer. "He has no ideas, no passions, no style,"—"quant aux idées, il les emprunte; quant aux passions, il les suppose; quant au style, il le copie." *Anthony* is in the worst style of the worst German imitations of what was thought to be Shakespeare; the characters are insignificant, there is no plot, and the action advances at haphazard; but the work was taken for a triumphant protest against vulgar morality because it ended with the hero stabbing his mistress at the approach of her husband, exclaiming, "Je l'ai tuée parcequ'elle m'a resisté." In comedy, Dumas could have succeeded better; *Mademoiselle de Belle-Isle* might perhaps be described as Beaumarchais without the sparkling dialogue, but some of the situations are really comic, and a little more care in developing the intrigue would have made it a good acting play. The hackneyed episode of a duel with dice is quite *de trop*, and neither helps nor hinders the natural catastrophe.

But it is not as a dramatist that Dumas earned his reputation: he is most known as the author of *Le Comte de Monte Cristo;* he is best known as author of *Les Trois Mousquetaires*. The latter work does not want much to make it a perfect historical romance. It is more amusing than *Quentin Durward*, or *The Fortunes of Nigel;* it is not more unhistorical, and the first half of it is not less moral. In fact, Dumas, at his best, rivals Scott in everything but the creation of his great humorous characters; he is always more readable than Scott at his worst because he gives less disproportionate space to matters of costume. *Les Trois Mousquetaires* is excellent while it keeps to its subject, but there is a great deal too much of "Miladi"; as an accessory she was very well, but the unity of the story is broken by the gradual substitution of her enmity and machinations for those of the great cardinal. The scene of her execution, a servile copy of the judgment on Adelheid in *Götz von Berlichingen*, is perhaps the most unfortunate of all the author's thefts. The principal purpose served by this episode is to provide a new evil genius, in the form of Miladi's son, for the heroes when they reappear in *Vingt Ans après*. This continuation is better than the worst, and not so good as the best, parts of *Les Trois Mousquetaires*, but poetical license is carried rather far when Charles II., of all people in the world, is chosen to repair the neglect of ungrateful sovereigns. The third part, *Le Vicomte de Bragelonne*, is simply interminable; it grew, like the riband a conjuror pulls out of his

mouth, till the spectators were tired of watching it, and then made way for a fresh trick.

It is chiefly in the name of *Monte Cristo*, that delight of schoolboys, that we ventured to claim for Dumas the high (relative) place hinted at above. The readers of this 19th century fairy tale lay in a stock of provisional credulity exactly similar to that which reconciles an Oriental to the djinns and marvels of the *Arabian Nights;* the phenomena are strange, but the student's science is happily just too scanty to warrant him in scepticism. As a work of art, *Le Comte de Monte Cristo* has been spoilt by the writer's indolent diffuseness. The magnificently luxurious count is quite a different person from the Edmond Dantes, whose slow revenge is the ostensible theme of the book; the two characters are constantly changing places and interfering with each other's development, and the consequence is that the main story lags wearisomely, while the ingenuity spent in inventing miracles of wealth is wasted; better placed they would be less like the day-dreams of a valet and *Lothair*. *La Reine Margot* is perhaps the next best known of Dumas' romances, but it is far inferior to *Les Trois Mousquetaires*, and as bloody as the most "Romantic" play. In his other works we have G. P. R. James, dashed more or less strongly with *La Dame aux Camélias*, and more or less enlivened with his own narrative art.

The *Impressions de Voyage* are half bookmaking about William Tell and the dukes of Burgundy, half amusing gossip, and guides' tales freely improved upon. The *Mémoires*, which for some time formed the staple of a journal entirely conducted by Dumas, also contain a good deal of padding, and half a volume at a time was devoted to any eminent contemporary who would consent to furnish materials for it. The only portion that has much independent interest is the account of the days in June, 1830. Dumas sailed with the stream; he did not, like the editor of the *Temps*, invent a whole provisional government with proclamations to match, nor, like Étienne Arago, prove to the Parisians that Paris was in revolution by closing the theatres; but he walked about the streets with a gun, and accompanied his friends when they had a fancy for charging any particular barricade. After the patriots had been dispersed by a discharge of cannon, he was asked if he had been under fire, and answered, Yes: "seulement je n'y suis pas resté longtemps." He was born in 1802; married, it is said in obedience to a hint from his patron, the Duke of Orléans, in 1842; his death last year was preceded by long illness and incapacity. If he deserves no higher praise than that of an intelligent maker of tales, it is partly the fault of the public which was easily satisfied with less than his best. H. LAWRENNY.

Songs before Sunrise. By Algernon Charles Swinburne. London: Ellis, 1871.

IF the *Songs before Sunrise* had been published anonymously, it would not have required a great amount of penetration in the reader to discover their author. There is indeed but one man in England who could and perhaps would have written them. They will probably meet with the same admiration from the one side and certainly with the same indiscriminate abhorrence from the other as their predecessors, the *Poems and Ballads*. These *Songs before Sunrise* are, in fact, nothing else than the continuation of those eruptions of hot and unfettered passion with which they share the same fundamental idea, applied in this case to the great political and religious questions of our age, and modified only so far as this more serious and elevated subject required. This idea is, in one word, that of Liberty, not so much the liberty which developes and constructs as that which lays low all conceivable limits which may surround the human spirit. All of us know how this Titanic volition led in the *Poems and Ballads* to exaggerations which ought to have been judged from an æsthetical rather than from a moral point of view, and the same might in many cases be said of this new production, although we gladly acknowledge that the *Songs* show a remarkable advance in the way of self-criticism and, in a certain sense, of moderation.

This abstract idea of freedom blossoms under the hand of the poet into a variety of forms, often of extreme beauty. About the morality or immorality of this idea in itself we shall have nothing to say. It seems to us that a poet has to be judged according to moral principles only so far as these are identical with the lines of beauty, and Swinburne before all men may rightly claim this privilege, because in him the purely artistic quality predominates over every other.

Unlimited freedom of human thought and action is Swinburne's first principle of philosophy, and he therefore attacks with the utmost ferocity every belief or institution which seems to restrain this supreme *droit de l'homme*. The Christian revelation, its Divine Author, and its human interpreters, the priests of all confessions, excite his intensest indignation. The Christian God with all His anthropomorphic qualities is, according to our poet, only an impure imagination, which the frightened and servile human mind created for its own thraldom, and which the same human mind purified must abolish:

> "Thought made Him, and breaks Him."

This phantom itself is stained with the vices of its creators, and has become their most cruel enemy and bane. In a poem called "Hymn of Man," which perhaps has never been reached, certainly not surpassed, in its sublime lyrical pathos, the Judge Himself, in whose name generations were slaughtered, is arraigned before the bar of man and condemned to death and utter oblivion. A deity in whose name so many crimes have been committed, cannot be the help of man—

> "What for us hath done
> Man beneath the sun?
> What for us hath God?"

ask the miserable outcasts of society in "Outside Church," while their happier brethren sing in pious contentedness their "Christmas Antiphones." For the priests have degraded the pure original socialism of Christian doctrine into a religion of the rich; they have made the cross

> "Shadowing the sheltered heads of kings."

These are in brief, and so far as it is possible to quote them, the reasons for which Swinburne breaks, and breaks fiercely, with the idea of a personal God. The true and sufficing object, on the other hand, of the religious emotions of man is his own ideal being, the

> "Pure spirit of man that men call God."

His idea of this *Être Suprême* our poet has defined in two poems, which for beauty of poetical expression may fairly be called masterpieces of the highest order: "The Litany of Nations" and "Hertha." The former is a prayer of all the children of the earth, however parted by diversity of customs and nationalities, to their common mother Hertha, "the earth-soul Freedom," the power of progress and liberty in Nature, as it is manifested by the everlasting struggle of light against darkness, of form against chaos. This power is eternal and universal. Hertha says:—

> "Before God was, I am."
>
> * * * * * *
>
> "The deed and the doer, the seed and the sower, the dust which is God;"

her head is crowned by the terrors and hopes of generations; her ong .. "hoarse and hollow and shrill with strife,"

till at last she attains her perfect stature in liberated mankind. The pantheism of these poems, and indeed of every line of this volume, is of a sort quite unrestrained and uncompromising; in this quality markedly distinguished from that of Tennyson.

The following sublime passage, in which Hertha answers the prayers of her children, is in its grandeur like the oracle of some unknown goddess:—

> "I am that which began;
> Out of me the years roll;
> Out of me God and man;
> I am equal and whole.
> God changes, and man, and the form of them bodily: I am the soul.
>
> Before ever land was,
> Before ever the sea,
> Or soft hair of the grass,
> Or fair limbs of the tree,
> Or the flesh-coloured fruit of my branches—I was; and thy soul was in me."

Swinburne's political radicalism is of the same order as his religious. To define his position in relation to this great question, it may be sufficient to say that the book is dedicated to Joseph Mazzini, in a little poem which, by the bye, is the simplest and therefore perhaps the most charming of all. His chief aim throughout is to introduce into this country the principles of the European revolution which this name represents. Since the Restoration, England has stood aloof from the main stream of continental life, but now the poet implores her, "by the star that Milton's soul for Shelley lighted," to arise and join the cry, and struggle for the universal republic,—the sunrise meant to be heralded, as with larks' voices, in these songs. But not to his own country alone does the poet limit his sympathies for the democratic movement. Wherever a sign of this new life is visible, be it in Poland or Greece, in France or Italy, he watches it with loving solicitude, while he sends his song over the ocean to "Walt-Whitman in America," his fellow-sufferer and fellow-singer. But foremost in this struggle he regards France and Italy, and for these two countries his lyre resounds in the most enthusiastic strain. France, "liberty's sign and standard bearer," and "Italia, the world's wonder, the world's care," must be united with England and Spain by the link of universal freedom. This ideal and purely humanitarian conception is all the more remarkable and precious for Englishmen, whose most advanced notions of political emancipation have been till quite lately almost, if not entirely, historical and insular. The unsympathetic exclusion of Germany, "by whose forest-hidden fountains freedom slept armed" (whatever that means), from partaking in the emancipation of man is a proof that our poet knows but little of the country of Heine and Schopenhauer, and but little of the infinite depth in the conception of human freedom which has been sounded by its greatest thinkers. The freedom of Swinburne is the flaming sword "to destroy the sins of the earth with divine devastation"; it is the principle of "fiat justitia pereat mundus"—

> "It is better that war spare but one or two
> Than that many live and liberty be slain;"

it is the *fraternité ou la mort* of the men of 1793, which in the person of Robespierre erected the guillotine whilst voting for the abolition of capital punishment.

Nearly the same might be said about Swinburne's veneration for the republic, the mere sound of whose name seems to possess for him a magic charm. This is objectionable from an æsthetical point of view. For a republic, like a monarchy, is even, if the best, only a certain form of government, which is in itself no poetical object.

Swinburne's great qualities appear in a much better light where he abstains from all these accidental forms, and symbolizes the pure idea of liberty, as he has done under the beautiful image of the Mater dolorosa, who—

> "Sits by the way, by the wild wayside,
> In a rent stained raiment, the robe of a cast-off bride,
> In the dust, in the rainfall sitting with soiled feet bare,
> With the night for a garment upon her torn wet hair."

In fact it seems that the grander the idea is he has to deal with, the higher grows Swinburne's power and felicity, while on the other hand, as soon as he introduces any distinct system or person, the violence of his attacks exceeds by far the limits of artistic propriety. The abuse of Pius IX. in the "Halt before Rome," or of the Emperor Napoleon, the "son of a harlot," in "Quia multum amavit," scarcely stops short of the *banale*. At the same time these energetic diatribes are something quite alien in character from the *Weltschmerz*, that hopeless and helpless apathy which paralyzes the highest aspiration of the modern spirit. Swinburne's active nature happily preserves him from that malady; his desire is never to leave off struggling and toiling, even without the faintest ray of hope, as his "Pilgrims" beautifully express it—

> "Nay, though our life were blind, our death were fruitless,
> Not therefore were the whole world's high hope rootless."

This is, in the main, what under various forms Swinburne has to say in the *Songs before Sunrise*. It now remains to make a few remarks on his manner of saying it. In the artistic form lies decidedly one of the greatest charms of his poetry. The flow of his rhythm, the composition of his stanzas, the correctness and music of his rhymes are inimitable. At the same time, he has the finest feeling for all the *nuances* of poetical expression; the richness and variety of his epithets is astonishing, and he succeeds even in presenting the most abstract ideas under symbols the most lifelike and picturesque. But in this boundless power over all the treasures of formal beauty lies our poet's greatest danger. Sometimes this grace of form engrosses his mind so entirely that the meaning of the words dwindles away as it were under his hands. We almost venture to say that not a few of his beautiful tirades convey no distinct meaning at all. In other places this meaning is extremely difficult to make out, owing to the great number of the different symbolic personifications, which makes it almost impossible to bring home to each the personal pronoun belonging to it.

The same may to some extent be said of several stanzas of the "Prelude," a fault, however, which is not incompatible with much charming "præ-Raphaelite" *chiaro oscuro* in the image of youth sitting on the hollow stream of Time, and rising to cast away the shallow joys of Pleasure and Passion which might prevent him on his long and toilsome journey to his own ideal self. Swinburne has also certain formulated expressions whose effect depends mainly upon their unexpectedness, and therefore loses much by their constant repetition. The chief of these is a sort of antithesis (by the way, neither peculiar nor original), as found in sentences like "we mad *blind* men that *see*," "these honours without honour," &c. The alliteration, too, appears sometimes overdone, and even tiresome, in these songs. Everyone who knows with how much moderation this was used in old Teutonic poetry, in which the other great modern principle of sound, rhyme, was wanting, must be shocked by a line like the following, "Hiding her high as her head," for which it is difficult to discover any onomatopoetic reason. But the greatest fault in Swinburne's poems is the immoderate length of almost all of them, which distracts the attention from the delights which lie concealed in single passages. This is the more inappropriate in poetry the pathos of which is chiefly lyrical, intense, and therefore transitory, in the production

as much as in the enjoyment of it. This drawback is again traceable to an overmastering richness of gift and idea, but also to a certain want of plastic power which should model the forms of a poem with a necessity akin to nature. Many of these poems might be several stanzas longer or shorter without any great difference in their general impression, and only a very few, like the "Watch in the Night," have an organic and inevitable conclusion. This fault, once more, might have found its correction in a greater familiarity on the part of our poet with German literature. Had he recalled the range and variety of poetic feeling which is included within the narrow limits of one of Goethe's, Heine's, or Möricke's *Lieder*, he would scarcely have written a marching song of forty and some stanzas. This lengthy exuberance characterises in different degrees all the modern English poets whose work shows the influence of Shelley (and whose does not?), and may be traced back to the great master himself. The lyric of Shelley, it must be remembered, is not, like the German, a development of the popular song, but is the poetical expression of the prolonged and passionate contemplation of a speculative idea. Besides Shelley, and perhaps Victor Hugo, it is scarcely fair to Swinburne to mention any modern poet as excercising great influence on his style. All his so-called models, Baudelaire, Walt-Whitman, or Landor, breathe the same air, the air of the modern social revolution; and this "elective affinity," of course, effects a certain likeness in their mode of expression: still here is no imitation of any of them. More discernible, as we think, is the influence of the masterpieces of Greek and Hebrew literature. If the pathetic strophes and antistrophes of the "Ode on the Insurrection in Candia" remind us of the grandeur of Æschylus, the "Eve of Revolution," with the "trumpets of the four winds of the world," has quite as decidedly the weird, strange character of Ezekiel or the Apocalypse. Some of Swinburne's stanzas, in which he shows a greater variety and beauty than any other English poet, bear evidence of a thorough study of Dante. The sonnets, for instance, those on Barbès, the French republican, whose life was saved by Victor Hugo's lines, and the paraphrase of Michel Angelo's celebrated inscription on the "Night," in that entitled "In San Lorenzo," are models of symmetry. The stanzas of the "Eve of Revolution" might (except the two last verses) be divided exactly according to Dante's theory into "pedes and versus" (*De Vulg. Eloq.*), and lastly, in the "Christmas Antiphones," with their artificial middle rhyme, Italian influence seems undeniable.

To conclude; we regard Swinburne as of all English poets the most highly endowed with the purely poetic gift; and there is little doubt of his rank amid the poets of all time but for his fatal wantonness and exuberance of power, the restraint of which, as Goethe says, is the note of the true master:

> "So ist's mit aller Bildung auch beschaffen:
> Vergebens werden ungebund'ne Geister
> Nach der Vollendung reiner Höhe streben;
> Wer Grosses will, muss sich zusammenraffen,
> In der *Beschränkung* zeigt sich erst der *Meister*,
> Und das Gesetz nur kann uns Freiheit geben."

FRANZ HÜFFER.

LITERARY NOTES.

Number 50 of the *Grenzboten* begins a valuable collection of hitherto unprinted letters, by German poets, of the so-called "Sturm- und Drang-Periode," a name originating with the title of a tragedy of Klinger, one of these poets. The letters are taken from the collection of the late chancellor von Müller, and are all addressed to the composer and poet Kayser, whose connection with the literary celebrities of his time is well known. They give a fair specimen of the wild and affected originality of those young Titans, which in some cases, as in that of Lenz, Goethe's friend and rival, led to actual madness. The first letter of this series is written by Klinger and Miller together, in alternate sentences, forming a curious *potpourri* of the most heterogeneous ideas. Other letters are from Stolberg and Miller, all more or less in the same style, the prose being occasionally interspersed with poetical passages. Of the greatest interest are the remarks about the chief poets of the epoch, Voss, Claudius, Herder, and Goethe, all of whom Miller knew more or less intimately, and admired. The second series (No. 51, *Grenzboten*) includes letters from Agnes Klinger, Lenz, Stolberg, and several of Schubart. In his letters the musical side of the "Sturm und Drang" movement appears, in the form of unlimited admiration for Gluck, who, as Schubart writes to Kayser, deserves to be worshipped. In striking contrast to the whole tone of these letters stands a note of Wieland, written in his usual style of reserved *bonhomie*. For him also "Gluck is an Apollo." The most valuable documents of the third series (*Grenzboten*, No. 52) are another letter of Wieland about Gluck, and a letter from Miller in which an account is given of the perfidious kidnapping of Schubart by the tyrannical Karl Eugen, Duke of Würtemberg, for writing epigrams against him.

We have received the first number of Gustav Freytag's new periodical *Im neuen Reich*, whose appearance we announced in our last. It would, perhaps, be unfair to take this as a sample of what Herr Freytag can, and no doubt will, do.

In the current number of the *Westminster Review* is an elaborate and comprehensive article on the poetical work of D. G. Rossetti. By far the best and newest thing in it is the short comparison of some of Rossetti's Sonnets with those of Shakespeare. There are however a few inaccuracies in the first part of the article which may probably be explained by too close a following of Fauriel. It is, for instance, perhaps a little difficult to prove that the Troubadours generally wandered so far as the feudal halls of Suabia: on the other hand, they exercised an undoubted influence upon the Minnesingers Friedrich von Husen and Rudolf von Neuenburg, as is shown by the imitations and translations of the latter. Apart from these slight defects, the article shows that faithful study which the works of this poet and his masters require and repay.

In an article, "De las artes magicas y de adivinacia en el suelo Iberico," contained in the *Revista de España* for Dec. 10, the writer shows how important a place the art of divination, and the study of judicial astrology held in the schools of Cordova, and enumerates the leading writers upon the subject among the Spanish Moors. In Christian Spain its professors were persecuted from early times by the Church, though the belief in magic, in its grossest forms, was very prevalent among the people. The review of the history of the black art is brought down to the days of the wise king Alfonso, who in his *Partidas* distinguished between black and white magic, and thus acknowledged that the art had its uses as well as its abuses. We are promised, in a future number, a sketch of the history of magic in Spain during the centuries succeeding the age of Alfonso.

The Paris letter of the *Athenæum*, Dec. 17, announces the death of M. Pierre Jannet, the well-known founder and publisher of the Bibliothèque Elzévirienne. He edited himself, among other works, *Les Quinze Joies de Mariage*, and the works of Rabelais. He was also remarkable for his great bibliographical and linguistic knowledge. The languages which he had mastered included Chinese, for which he tried to introduce an improved mode of printing.

The banks of the Guadiana were famous as the cradle of several mighty conquerors in the New World; of Cortes, Pizarro, Garcilasso de la Vega, and Belalcazar. But they are equally renowned for the number of zealous friends of the Indians who went forth from Estremadura to ameliorate the condition of the

conquered people in East and West. One of these was Froy Juan de Plasencia, whose labours in the Philippine Islands are given in detail, by Señor Barrantes, in the last number of the *Revista de España*. This fervent and warm hearted friar takes his place in the front rank of that band whose leader was Las Casas, and of whom Spaniards have more reason to be proud than of their boasted Conquistadores. Señor Barrantes promises further interesting sketches of worthies of the 16th century connected with Philippine history; a subject which has recently been so ably handled by Lord Stanley of Alderley in his translation of Antonio de Morga.

Art and Archæology.

EXHIBITION OF OLD MASTERS AND DECEASED BRITISH ARTISTS.

Preliminary Notice.

Last year, when the Academy took up the office of the defunct British Institution, as far as the old masters were concerned, by opening an exhibition of their works by loans from English collectors, combined with the pictures of deceased painters of our native school, the collection comprised in all 235 examples. This small number was reduced by about a third, pictures by Stanfield and Leslie in rooms by themselves numbering 74. Even then it was said that once in two years or three would be as much as could be looked for without exhausting the resources of the country, and here in the exhibition just opened we have no fewer than 426 pictures, the great majority of high intrinsic interest, and many of them of unspeakable value and importance.

So large is the collection, and so extraordinary, we feel unable to cope with it in the hurry and variety of the ordinary London art season, and wish it had been only half the extent, so that we would not come away after spending an hour or two in Burlington House with the feeling that a proper measure of study and enjoyment is out of our power. The arrangement, besides, is apparently fortuitous; English pictures of yesterday, wretched French things like those by Greuze, Dutch genre, and Italians of the great time, are all side by side. Added to this, the Academy is too polite to refuse a great collector's offered picture because it is not genuine, or to insinuate a doubt into the catalogue, so that the difficulty of determining whether the work we stand before is what it pretends to be, checks the spectator's enthusiasm. They say that it is impossible to do other than accept the names attributed by the proprietors, and such in a politic point of view is very likely the case, but the subject might be properly described, and the portrait of a standard-bearer need not be entered as a burgomaster, as in the case of Rembrandt's splendid picture, No. 77. The small picture called "Reconciliation," No. 49, an admirable finished sketch by Rubens, is the Sabine women rushing between the swords of their brothers and husbands, and is companion to another of the "Rape of the Sabines," which has an extraordinary interest as the sketch for the large picture in our National Gallery.

Out of this great collection let us try to select a few of the most notable, and here the earlier men of the Italian school are by far the most important. Botticelli, for example, Bellini, Filippo and Filippino Lippi, are rarely seen to such advantage. The two long pictures of the history of Virginia, No. 271-2, indeed, are early Filippinos; but the piece of a tempera on wood, by Filippo, No. 281, sent by Mr. Wynn Ellis, is beyond praise. By Botticelli, we have three pictures, more important in size and excellence. All three are Nativities. One of them, No. 299, is possibly known to many of our readers, having been before the public with Lord Dudley's collection in the Egyptian Hall, which collection, we may say parenthetically, is again before the public in this exhibition, no fewer than 129 being lent by that nobleman. The other two are still finer works. In the picture No. 294, five young saints in gorgeous attire, kneel round the Virgin and Child, the whole group having that certain mystical and poetic character which distinguish this master of the Florentine school, whose light paled before the great development of the early years of the 1500. He, like his contemporary Mantegna, who is represented by three uncertain pictures, the best by far being the "Wise Men's Offerings," No. 287, lent by the Dowager Lady Ashburton, has a strong individuality apparent in all he did, while he is also representative, expressing the innocence of the earlier conceptions of Christian story and mythology, and the mediæval manner of rendering them. The third Botticelli, lent by W. Fuller Maitland, and numbered 278, is not only one of the most notable works in this gathering, but, we are inclined to think, one of the most delightful and valuable of the school to which it belongs, whether it really be from the hand of the master or not. It is small, 32 in. by 30 in., the figures being of the size to which the artists were accustomed in painting the long scenic decorations on marriage chests. In the centre is the Holy Family, under a kind of baldaquin of thatch, on which three angels sit, giving them music, like the pipes and tabors of the little gallery in the barons' hall. Above them, and above the trees, is a glory of angels, four red, four white, and four of a dark bronze colour, dancing in a circle, the space between being like the entrance to heaven, all of gold. All these figures are exceedingly lovely, and one or two perfectly free from the quaintness we attribute to imperfect training. All of them carry great branches of myrtle, but the words on the banderols that fly about are now nearly lost. To descend to the green earth beside the Holy Family; on one side are the Shepherds, on the other the Magi, two lovely groups, each group being under the charge of an angel with bright-coloured wings, and in the foreground, which is strewn with the bodies of monstrous little devils, living, but skewered through with darts, are three similar angels embracing three saints or prophets. This meagre description will partly enable the reader to see what a superb poetic creation we have in this small picture.

Lord Dudley's pictures we shall not enter upon, as they have been seen before. Nos. 268 and 270 are two crayon studies for the heads of Christ and St. Peter by Da Vinci for the "Last Supper," admirable works, certainly, we think, from the hand of the master, and apparently cut from a cartoon of the entire subject, hands of a neighbouring figure appearing in the drawing of St. Peter. There must be some history attached to such noble fragments, and, whether or not, the Baroness North may congratulate herself on their possession. No. 88 is a Holy Family, by Fra Bartolomeo, of equal interest. It is no more than the beginning of a picture, the most part of it being only freely drawn out by the reed pen on the gesso ground, now changed from white to yellow. One of the finest pictures in the whole collection is Bellini, No. 92, "The Virgin: the Child seated before her, surrounded by four Saints and the Donator:" a little doctored, but very carefully. By Giorgione, whose works are so seldom seen, we have three, all of great beauty. Lord Ashburton's "La Richiesta" is celebrated, but No. 227, "An Italian Villa, with groups of figures," is also very charming and perfect in colour. In this particular, time has befriended the Venetians. Of the earlier northern schools we have no less than three elaborate Van Eycks, and one by Mabuse, with a wonderful renaissance background.

Second only to these early works, and to the examples of the Venetian school as seen in the pictures of Titian, of which there are many, Tintorette, Bonifazio, and others, are the portraits in this exhibition. These are very numerous, and nearly all of the highest order; Vandyck is especially well represented. In the nineteen works under his name we find specimens of all his periods, from the early imitations of Rubens, through his Italian middle time, to his latest English. Sir Joshua Reynolds and Gainsborough seem endless, and every time one sees them, these painters rise in our admiration. Having named these English artists, we may mention others appearing here in great force, especially Constable and old Crome, both of them noble landscape painters, who died before passing into the egotism and fatuity of success in which Turner's later years were passed. By the latter painter we have four; the wonder being we have no more. Of these, No. 235, "Landscape with Cattle," is an imitation of Gainsborough's manner, but very fine; No. 140, "The Fifth Plague of Egypt," is one of his great productions; and No. 40, "Italy," is an imitation of his later manner, by Webb, who, it seems, imitated Turner and Constable to the advantage of the dealers, and made better pictures than his originals. In this instance we think he really has done so.

William B. Scott.

Archæological Topography of the Taman Peninsula [*Arkheologicheskaya Topografiya Tamanskago Poluostrova*]. By Carl Görtz. Moscow: 1870.

IN the year 1859 the Russian "Imperial Archæological Commission" sent an exploring party to the Peninsula of Taman, between the Black Sea and the Sea of Azof. What a treasure-house of antiquities that part of the country is, all archæologists know well, the subject having been exhaustively treated by M. Dubois de Montpereux in his *Voyage autour du Caucase*, and the galleries of the Hermitage at St. Petersburg bearing testimony to the richness of the hoards of gold ornaments of which the tombs near Kertch could once boast. Such a discovery as that made in 1831, when 120 lbs. of gold jewellery are *said* to have been taken out of one mound, may never again reward an explorer's patience, but yet there can be no doubt that much that is valuable still remains to be found.

In the volume now before us, Mr. Görtz, the well known Russian archæologist, gives a topographical description of the country in which the excavations of 1859 were made, and a brief sketch of the results to which they led. A work on which he is at present engaged will contain the full details of the successive explorations. In the meantime he has mentioned a few of the principal objects discovered. One of the most interesting was the sarcophagus of carved wood inlaid with ivory, in which were found the remains of a woman, apparently a priestess of Demeter. A number of gold ornaments, all belonging to the best period of Greek art, had been buried with the corpse, and by its side were four beautifully chased bits, the relics, perhaps, of the horses which may have drawn the chariot of the priestess. Another was a sarcophagus, discovered in 1868, attached to the sides of which were several heads of griffins in gold, while inside it were a number of female ornaments, necklaces, bracelets, and rings, also all of gold. Together with it were found some thirty terracotta statuettes, most of which were "very original male and female caricatures of a Baccho-Erotic character," and which retained traces of the motley colouring with which they had originally been covered.

Tombs which had not previously been rifled generally rewarded the explorers with similar results, but in many cases, after ingress had been obtained, it was found that other treasure-seekers had been there beforehand. Various stories are told about them by the natives. Many of the mounds are supposed to be guarded by evil spirits, and he who disturbs them is in danger of being carried off by a sudden storm. Everywhere tales are rife of great treasures hidden away somewhere in the neighbourhood. In one place, for instance, it was said that towards the beginning of the present century a boy and girl, the children of a Cossack herdsman, were out watching their cattle one day, when their dog, while chasing some animal, suddenly disappeared in a hole which led into the interior of a *kurgan*, or mound. The children made their way into it, and came to a subterranean chamber, in which was a great white coffer, surrounded by numbers of *bolvans* and "dolls." *Bolvan* is the name given to the great shapeless stone figures found in South Russia and elsewhere, about which so little is known; the "dolls" were no doubt the terracotta statuettes which occur in such abundance in the tumuli. The children carried off some of the "dolls," but they agreed to say nothing as to where they had found them, intending to renew their researches at some future period. But time passed, the girl married and went away; the boy became a soldier and disappeared. Meanwhile their secret had leaked out, so the neighbours from time to time made exploring parties and tried to find the great stone coffer, which they thought might be full of gold. But all in vain; the entrance into the *kurgan* was never found again. Sometimes, however, the unauthorised treasure-seekers have been more successful. One Russian archæologist worked for six weeks at a mound without being able to penetrate it. He was followed by another, who spent three weeks more over his task. At last he made his way into its central tomb. This was a great stone vault, with an arched roof, and in it were portions of a wooden sarcophagus, fragments of a human skeleton, a white marble table, and pieces of vases. But whatever treasures might once have been there had been carried off by some previous explorers who had made their way in by the roof. So such treasure-seekers, who work with an eye to gain only, and know nothing about art, must sometimes be rewarded. In some districts along the coast it is the custom for the Cossack women and children to go down to the shore after a heavy gale from seawards, and there to search in the sand for the bronzes and coins which are then to be found there, together with quantities of terracotta statuettes and fragments of Greek vases.

Mr. Görtz's book is written in Russian only, but it is to be hoped that both it and the detailed account of the excavations to which it is intended to serve as an introduction may appear some day in the form of a translation. The careful manner in which he has treated his subject—one on which he is entitled to speak with authority—would render his work valuable to the antiquarians of many lands, were they not deterred from using it by linguistic difficulties.

W. R. S. RALSTON.

ARCHÆOLOGICAL WORK IN ROME UNDER THE NEW REGIME.

Rome, January 3rd, 1871.

NOT many days had passed after the ever memorable 20th September, 1870, when the newly established journals of Rome announced that the government of the Royal Lieutenant had assigned 300,000 francs per annum to the works of excavation and repair in the sphere of monumental antiquity, and to the maintenance of the public museums, especially the Capitoline, in this city. On the 11th Nov. appeared in the *Gazzetta ufficiale di Roma* an edict of General Lamarmora, to the effect that the former "Commissariat of Antiquities," presided over by the Baron Pietro Visconti, is abolished, and a "superintendence for the excavating of antiquities and the guardianship and preservation of monuments in the province of Rome" created in lieu thereof; this board to be composed of a superintendent and six counsellors, the former and two of the latter to be appointed by government, the other four counsellors by the Provincial Deputation and Municipal Junta of Rome. Another clause of the same edict nominates to the post of superintendent the Commendatore Pietro Rosa, who has so long and ably directed the works on the Palatine in the Farnese gardens, purchased by the Emperor Napoleon; and two artists—Prof. Bonopiani for paintings, and the Cav. Tadalini for sculptures—are nominated as assessors to superintend the discovery and destination of objects found. Through other sources I learn that the application of the endowment, 300,000 fr. per annum, is confided to a triumvirate alike responsible; namely, the Signor Rosa, Signor Gori—a well known Roman archæologist—and Signor Tocca, an artist. The first projects adopted by the newly constituted body, and recommended by authorities, was the prosecution of the works on the Palatine, and purchase of another estate (pertaining to the nuns of a convent there situated), contiguous to the Farnese on that "Imperial Mount," in order that the area of excavations may be extended over the entire hill; also the reducing of the Forum, at least of the Via Sacra, to its original level, and alike laying open the ancient level (long covered) between the Forum and the Colosseum; also the undertaking of similar works in the Forum of Augustus, and purchasing of ground therein comprised from the nuns of the Nunziatella convent. Rosa's project is to restore to the extent possible the Julian Basilica (first discovered, but in vaguely discernible ruins, about 12 years ago), with the ancient

material found on the site. The new government has purchased from the ex-Emperor the Farnese estate on the Palatine for 360,000 fr., Napoleon III. having purchased it from the ex-King of Naples, in 1861, for 10,000*l.* sterling; and not long afterwards another well-advised purchase by the Royal Lieutenancy was announced, that of the Braschi estate, near Tivoli, containing the vast and long-neglected ruins of the Villa of Hadrian, another site for archæologic undertakings to commence before long, as expected.

Walking on the Forum about a fortnight ago, I saw for the first time some 30 or 40 men at work on the newly ordered *scavi* around the Julian Basilica and the column of Phocas. Returning, I have noticed an increase in the number of labourers, affording proof of the intent to carry out the promise officially given that 200 workmen are to be at the service of the archæologic superintendence. The ruins of the Basilica are laid open to somewhat greater extent, but without any important results hitherto. Under the majestic arcades of the other Basilica, that of Constantine (long miscalled the "Temple of Peace"), have been found an ancient conduit and some fragments of sculpture, among which a bust and a mutilated female statue are noticeable.

Not without regret did I see for the first time the change recently wrought within the Colosseum by stripping those ruins of all the graceful draperies provided by nature, the overshadowing forest trees, the luxuriant plants and hanging tapestries of wild growth, that concealed yet beautified. Byron's lines—

> "The garland forest, which the grey walls wear,
> Like laurels on the bald first Cæsar's head"—

will henceforth be no longer applicable to the gigantic skeleton of the wondrous amphitheatre. Yet I cannot altogether agree with the sentimental reprobation called forth by this proceeding. The few spreading roots of large trees and of the utterly unchecked vegetation, which added so much to the picturesque aspect, were undoubtedly accelerating the progress of decay. The artist may condemn, but the archæologist must rejoice in this case.

On the 16th December, the German Archæologic Institute commenced its weekly sessions for the winter in its well-stocked library in the Capitol; and on this occasion very interesting papers were read by Prof. Henzen, the Cav. di Rossi, and another gentleman; some remarkable terracotta busts, serving as antefixes in Etruscan tombs lately opened at Cerveteri (the antique Cære), and several photographs, were exhibited; the attendance was unusually numerous. In reference to the above-named gentlemen, I may mention the present literary undertakings on which Dr. Henzen and the Cav. di Rossi are engaged: the former on the completion of his *Corpus Inscriptionum;* the latter on the 3rd volume of his *Roma sotteranea*, already so celebrated a work, and another, the 2nd volume of his *Inscriptiones Christianae*—the first having been published a few years ago. His *Bolletino* of Sacred Archæology continues to be issued, and in a new series of improved form and typography.

On the 30th, the British Archæological Society commenced its sessions—also weekly, and held on the Friday evenings at half past eight in the Palazzo Poli. For this inaugural meeting Mr. Parker was ready with a very interesting report on the excavations and antiquarian discoveries in Rome during the year; dwelling also on the present prospects both of that society and of archæologic undertakings in or near this city generally. No discoveries of *primary* importance entered into this review, except, indeed, one, and that so interesting that I cannot attempt here to do justice to it—the Mithraic Temple found, a few months ago, under the church of S. Clemente in the researches intelligently carried on by Father Mullooly, prior of the Irish Dominicans, who have their convent beside that ancient basilica. This temple may be supposed to represent the sacred cavern of Mithras, with its vaulted roof pierced by eleven large skylight windows, its altar and platform for sacrifice *in situ*, and other highly interesting details. A statuette of the god, at the moment of his birth from the rock, was found about the same time, though not within the temple, by the learned prior, who has caused photographs to be made of these as well as all other objects brought to light through his means. This representation of the Oriental god, issuing out of the parent-rock, is unique; the hands are alone wanting: but from the attitude of the arms, it is evident that they both held certain symbols, perhaps torches. A paper on this Mithraic Temple is promised by the British archæologists, to be written by the Cav. Visconti.

C. J. Hemans.

THE OGHAM INSCRIPTIONS.

The study of that interesting class of lapidary inscriptions known as *Ogham* Inscriptions, which are found in many localities in the South of Ireland, has latterly received a great impetus through the labours of Dr. Samuel Ferguson, Deputy Keeper of the Records of Ireland.

Hitherto the great obstacle to the promotion of the study of *Ogham Inscriptions* has been the want of anything like a collection of reliable copies of the inscriptions. The field of enquiry was invaded by some enthusiasts who contented themselves with obviously erroneous *drawings* of the inscriptions, and sacrificed the interests of exact truth and science to the indulgence of whimsical theories about pig-worship, cow-worship, and Priapian notions.

Dr. Ferguson has already secured most accurate paper moulds of about forty of these inscribed stones, from which metal casts can be taken. The moulds are at present arranged in the Royal Irish Academy, where Dr. Ferguson also intends to deposit a series of casts, which will, in fact, serve as the foundation of an Ogham Museum, and place the study of this heretofore obscure class of inscriptions for the first time on a sound basis.

Miscellaneous Notes.

The *Pall Mall Gazette*, for Dec. 31, 1870, quotes the following from a Texas paper.—Advices from Santa Fé state that Governor Arny, the special Indian agent for that territory, has found the Cañon de Chelly, which was explored for twenty miles. The party found cañons, whose walls tower perpendicularly to an altitude of from 1000 to 2000 feet, the rock strata being as perfect as if laid by the skilled hands of masons, and entirely symmetrical. Among these ruins of ancient Aztec cities many of them bear the evidence of having been populous to the extent of many thousands of inhabitants. In one of the cañons, the rocky walls of which rose not less than 2000 feet from the base, and whose summits on either hand inclined to each other, forming part of an arch, there were found high up, hewn out of the rocks, the ruins of Aztec towns of great extent, now tenantless, desolate. In one of these rocky eyries there remained in a state of good preservation a house of stone about twenty feet square, containing one bare and gloomy room, and a single human skeleton. In the centre of the room were the evidences that fire at some time had been used. The only solution of this enigma thus far ventured is that these solitary rooms were the altar places of the Aztec fires; that from some cause the people at a remote period were constrained to abandon their homes, but left one faithful sentinel in each instance to keep alive the flame that, according to the Indian traditions of these regions, was to light the way of Montezuma again to his people—their hoped-for Messiah and their eternal King. A close examination of many of the ruins proved that the builders must have been skilled in the manufacture and use of edged tools, masonry, and other mechanical arts. But who these people were, whence they came, and whither they are gone, is now probably one of the mysteries to remain eternally unsolved. Some of the ruins are reported to be stone buildings seven and eight stories in height, being reached by the ladders planted against the walls. Round houses 20 feet in diameter, built in the most substantial manner of cut stone, and plastered inside, were also found in excellent preservation. Astonishing discoveries have been made of gold and silver regions richer than any yet known on this continent. They are supposed by well-informed persons to be the East mines, of which tradition has handed down the most marvellous tales, and the mines themselves discover unmistakable evidences of having been successfully worked ages ago.

The well-known archæologist Helbig has lately called attention in the *Grenzboten* (No. 50) to the mode of representing the

action of breathing in antique sculpture. In the first state of earlier Greek art the only means of representing the act of breathing seems to have been a heaving breast with the lips closed, as in the Apollo of Tenea. A further advance was marked by the opening of the mouth, which, however, was done in an imperfect manner, chiefly by protruding the underlip. This theory, if true, may serve to explain appellations like that of the "yawning" Dionysos of Samos used by later Greeks. Phidias and his followers continued both these modes of expression with characteristic finish and grandeur. Those works, in which the influence of Praxiteles is visible on the other hand, show only a very slight expansion of the breast, while the protruded underlip entirely disappears. This agrees perfectly with that graceful *laissé-aller* which forms a chief characteristic of the works of this school. In the next state of development, as introduced by Lysippos, the action of breathing leaves no impression on the lower part of the body, while its surface, showing the veins, skin, muscles, is rendered with exquisite life-like accuracy. In the time after Alexander the closed lips occur again, but seemingly only in portrait-busts, while the statues of gods and heroes preserved their classical traditions.

New Process of Photography.—The liability of photographic prints produced by the ordinary silver process to fade under the action of strong lights is a defect which photographers have long attempted to overcome. A new photographic process, entirely independent of the use of nitrate of silver, and producing prints absolutely imperishable, and yet of the delicacy of the most beautiful silver-prints, has recently been brought to perfection under the name of Heliotypy. The process depends on the well-known action of light in rendering gelatine and similar substances, under certain circumstances, insoluble. A plate of glass is coated with a warm solution of gelatine, to which a suitable proportion of bichromate of potash has been added, the coat, when dry, being about the thickness of an ordinary visiting-card, the operation having been carried on in a dark room from which all actinic light is excluded. When dry, the film is exposed to light under the photographic negative taken in the ordinary way. The plate is then placed in cold water to dissolve out all the unchanged bichromate of potash, when the image produced by the action of light on the film is seen in relief. The portions protected from the light by the opaque parts of the negative, representing the whites in the picture, readily absorb water and swell; the portions to which light has had full access through the most transparent parts of the negative, representing the blacks, have been hardened by the light, and rendered insoluble and non-absorbent; whilst all the portions partially acted on by the light through the graduated degrees of transparency in the negative, representing the gradations from light to dark in the image, have been rendered insoluble and non-absorbent just in the degree to which they have been subject to the action of light. The plate, after being thoroughly washed, is now ready for printing, which is effected by a process exactly analogous to that of lithography. After being sponged with water, and the superfluous moisture removed by an india-rubber scraper, an india-rubber roller charged with lithographic ink is applied to the surface. The ink readily adheres to the deep shadows, which, being hard, insoluble, and non-absorbent, have repelled the water altogether; to the parts representing the various gradations of tone the ink adheres in such degree as they have rejected water, producing a perfect transcript of the original negative in the proportion of ink remaining on the different parts of the image. The impression is then pulled in the ordinary way on a sheet of fine plate-paper. Several steps of this beautiful process have long been known; their concatenation and perfection are due to Mr. Ernest Edwards. In the number of *Art, Pictorial and Industrial*, for October, is a detailed account of it, together with some extremely fine illustrations. From the absolute indestructibility of the prints by light, the rapidity of their production, as compared with ordinary silver-printing, entirely independent of the weather, and the beauty of the tone, heliotypy bids fair rapidly to supplant the old process, at least for all purposes of book-illustration.

Music.

In treating of the vexed questions of Musical Criticism, we shall follow the same rule as we have hitherto pursued in Theology: i. e. *we shall give free expression to the most divergent points of view, of the Classical School of the Past, as well as of the "Music of the Future," the latter of which has not hitherto been represented by a critical organ in this country.* ED.

UNPUBLISHED LETTERS OF ROBERT SCHUMANN.

I.

WE give, as the best introduction to our new musical department, the first set of a series of letters written by Robert Schumann, between 1835 and 1844. These letters cover almost the entire period during which he was the presiding genius, as editor or otherwise, of the *Neue Zeitschrift für Musik*, which he had recently started.

The state of music in Germany was at the commencement of this period not encouraging. Rossini ruled the stage, Herz and Hünten the pianoforte, the last two mere *virtuosi*, entirely innocent of the spiritual import in musical art. Musical criticism in the hands of the almighty Rochlitz and his tribe, as in England at the present day, contented itself with disquisitions on the technical "how," with little heed or appreciation of the spiritual "what" of the performance. And yet the great masters, Beethoven, Weber, and Schubert, had but just passed away. The stars of Mendelssohn and Chopin, on the other hand, had scarcely risen. At this point, Schumann and a few brave friends started their journal, to fight for the vital principle of "die Poesie der Kunst," the deep underlying meaning, as opposed to the merely external enjoyment, of musical sound. "Können Sie mir vielleicht," writes Schumann to Zuccalmaglio, in December, 1835, "einige *poetische* Menschen Ihrer Bekanntschaft als Mitarbeiter der Zeitung nennen?" Not that Schumann was the inventor of this principle, which is the informing, though as yet unconscious, soul of the great music of all time: in Gluck, it had attained to a few articulate utterances in the introductions to some of his operas; in the great nature of Beethoven, it had awakened to meditation, but not to speech, and remains to us embodied in the immense musical effort of his later life, which culminates in the Ninth Symphony. Schumann broke down once for all the wall of partition between the writer on music and the musical composer. We may almost say that his writings and criticisms form a kind of enlarged programme and commentary to his musical works. This then is the new thought which struggles toward expression in the brain of Schumann, as founder of the more or less imaginary society of Davidsbündler; and to which, as exemplified and carried out to its legitimate consequences in the writings and music of Wagner, we shall have frequently to recur.

The letters, nineteen in all, are written to Anton von Zuccalmaglio, one of the most devoted contributors to Schumann's journal, and living at that time in the house of Prince Gortschakoff at Warsaw. From Zuccalmaglio they came into the family of Mr. Franz Hüffer, in whose possession they now are.

(1)

[*Apparently dictated.*]

"DEAR SIR, "*Leipzig, 11th Aug.* 1835.

"It was not till some weeks ago that we received your MSS., and are delighted to find that our young institution [the *Neue Zeitschrift*] has found an echo in the far North. The letter you contributed is a capital parody of certain epistles in German newspapers. Your Wedel,* the

* Probably one of the imaginary impersonations, like Florestan, Eusebius, Raro, &c., under which Schumann and other actual or aspiring "Davidsbündler" were accustomed to represent phases of their own characters or opinions.] L.S.

village sexton, is an excellent idea, and admirably adapted for our journal. Both the papers will shortly be printed. As to the printing of your poems, I hope you will have a little patience, as we have arrears which will take half a year to clear off.

"Won't it be possible for you to send your communications by a shorter route? "R. Schumann."

Schumann adds a note in his own handwriting:—

"Your second letter of Aug. 5 has this moment arrived. This goes by post in order to set your mind at rest about your excellent papers; the answer to your second will follow in the bookseller's parcel in a few days. One or the other will, I hope, reach you. In any case, favour us soon with something new. If you like our musical paper, you will greatly oblige me by mentioning it occasionally.

"R. Schumann."

(2)

"Dear Sir,—First of all my best thanks for your new contribution. There is something in your articles which pleases me, but for which I cannot yet find the right name, unless it be the quiet way in which you dive down to the deepest places of the soul, and the clear exposition you give of what you have seen when you reappear on the surface. Continue to delight us by going on. Your capital proposal to supply a new text to Mozart's operas I quite agree with; but I have my doubts whether you will be able to carry it through. We know what publishers are, not to speak of managers, and especially the public, when they have once taken an idea into their heads: however, try it. So far as I am concerned, I am quite at your service, so long as I have nothing to do with the commercial side of the question, of which I am supremely ignorant. Have the kindness to let me know more of your plan, whether it includes any structural alteration in the plot, or only a text better adapted to the score, and so forth, in order that I may consult a publisher here about it. There is another thing which is rather on my mind. You know how difficult every undertaking is at the beginning. Our new journal meets with an unusual amount of sympathy: but yet I am working almost entirely without pay. If you are not compelled to live by your pen, clever, excellent as it is, I hope you won't mind waiting a little while longer for the usual *honoraire*. But if this is to be a bar to your sending us further contributions, consider the previous sentence cancelled. I accept all your conditions. On this point please send me your decision at once. "Yours truly,

"*Leipzig*, 28/9, '35. "R. Schumann."

(3)

"*Dec.* 17, '35.

"Dear Sir,—Two things very different from one another have prevented my answering your letter before, I have been travelling, and I have been ill. First of all, about the publication of your manuscripts, a matter in which I take the warmest interest. I have knocked once and again at the publishers' doors for you. It is hard enough for principals to get any tolerable terms out of booksellers, let alone third parties. At last I found that the trees had prevented me from seeing the wood. My brothers are booksellers, and a firm, I think I may say, of good standing (Gebrüder Schumann, at Zwickau), and they will be happy to take your metamorphosis of the text to Mozart, but only on condition that you share the loss as well as the profit. This, although I represented to them the inconvenience of such an arrangement. Now, you must decide, please. You can depend upon everything being above board, and upon their punctuality, whether you have a yearly or a shorter account with them. It will be better for you to apply direct to the house at Zwickau, and arrive at something definite. Your essays and letter I have. All excellent. Wedel has been declared member of the Davidsbund, whether you like it or not. Waldbrühl seems to me too obvious a pseudonym, so I have changed it to W. Brühl; you will forgive me. If you read our journal regularly (I hope you do, but should be glad to know for certain), you will stand some chance of improving your acquaintance with the Davidsbündler.

"We shall be glad of any number of pages out of W.'s diary. If I can be of use in any other way, I am at your service. Do you know anything of the editor of the *Volkslieder* (along with Baumstark, of Heidelberg)? Can you give me the names of some people *with a turn for poetry*, who could contribute to the journal? "Yours very truly,

"R. Schumann."

These letters bring us to the end of the year 1835, and show the difficulties with which, even in Germany, the "higher criticism" in music had to contend. Franz Hüffer.

(*To be continued.*)

THE LAST ENGLISH MUSICAL SEASON.

The commemoration, by pipe and string, of Beethoven's centenary, which was to have occupied all musical Europe during a considerable portion of the past year, has, through the enforcement of sterner occupation and the exclusive handling of rougher instruments, been made to fall for the most part on England, whose musical tastes and powers "musical Europe" is wont to hold cheap. All things considered, English musicians, artist or amateur, have a right to look back on what they have done and tried to do in honour of the great master with a good deal of satisfaction. Beethoven's genius is as varied as it is exalted: not only has he done better than others, but more—better and more too in an art the forms and resources of which have increased and multiplied in this century—greatly, no doubt, through his own agency—at a rate without precedent. It would be hard to name an aspect in which his many-sided genius has not of late been presented to English audiences—largely by English artists—in the most efficient as well as the most agreeable manner, by means of performances, not merely of pieces in every form of musical art which he has essayed, but of almost every individual specimen of those forms. To take London and its dependencies alone. At the Crystal Palace, at the Philharmonic, at the Monday Popular, and at the Oratorio Concerts opportunities have been offered, and eagerly and largely accepted, of hearing all Beethoven's orchestral symphonies, the ninth not excepted, his concertos, the majority, if not all, of his instrumental chamber-music, his single opera, his single oratorio, the second as well as the first of his Masses, and a number of shorter, though not always slighter, productions, even down to certain "arrangements" of our own national melodies. Of these performances the greatest number and the most important have been given at the Crystal Palace. The execution of the septet by Mr. Manns' entire orchestra was, as execution, deserving of high praise. The propriety of presenting a piece of chamber-music at all in such a way is surely more than questionable. For the rest, the performances at one and the same concert of the Choral Fantasia and the Choral Symphony, and at another of the three Overtures to *Leonora* in immediate succession, might alone entitle the musical direction of the Crystal Palace to the gratitude of all students and admirers of a genius the development of which they served in so striking a manner to illustrate.

The provincial towns, their means considered, have not lagged behind the metropolis. At Manchester, Liverpool, Leeds—the first especially—at Dublin, at Glasgow, even at Edinburgh—still in its musical infancy—recognition, more or less hearty and intelligent, has been shown of the first musical composer of whom it could be said that he had even tried to express the yearnings and the aspirations of his own age, and had succeeded in his attempt without falsification of the material in which he worked, or without putting a greater strain upon it than it would bear.

Our thoughts of late have been so often turned exclusively on Beethoven that we have been perhaps not mindful enough of what else has been going on beside as well as along with the *cultus* of the great master.

The past year will also be memorable in another way. There are many indications of the deepening as well as of the widening of musical culture in England. In the production and performance of church-music very considerable improvement of late has been noticeable. There are persons—the wish perhaps is father to the thought—who believe that the lives of the cathedral establishments may be, if not eventually saved, at least indefinitely protracted. Be this as it may, the quantity of new music—to say nothing of old—for church use published during the past year has been enormous, and the quality of much of it not unworthy of commendation. In regard to the practice of church-music, a respectable contemporary, the *Choir*, calls attention to the fact that during the past year "not only has the number of churches where there is a full choral service risen from 128 to 146 in London alone, but the return of churches with a partly choral service shows a still greater, indeed, an enormous, increase—from 115 to 170."

Another indication in the same direction will be found in the increasing study and practice of the works of Johann Sebastian Bach. True, our esteemed Sacred Harmonic Society of London continues pertinaciously to ignore his existence; but meanwhile the excellent and cheap editions of his greater choral works, whose very names were unknown to the last generation of

English musical students, are already sold in large numbers. Better still, the past year has been marked by a loving and meritorious performance of the difficult *Passionsmusik* at the Oratorio Concerts, and a "public rehearsal" (under my own direction) by the students of the Royal Academy of Music of the two first parts of the *Weihnachts-Oratorium* never before heard in this country.

Lastly, the production of our adopted countryman's, Mr. Benedict's, oratorio "St. Peter," at the Birmingham Festival, and subsequently at St. James's Hall, is an event not to be passed over. Opinions differ, and are likely for a long time to differ, as to the place this work will take among works of its class; but it is impossible to resist its claim to the possession of much beauty, uniform refinement, rare sustaining power, and unsurpassed mastering of orchestral and other effect.

Physical Science.

Scientific Results of a Journey in Brazil. By Louis Agassiz and his Travelling Companions. Geology and Physical Geography of Brazil. By Ch. Fred. Hartt, Professor of Geology in Cornell University. With Illustrations and Maps. Trübner and Co.

THIS book is open to the same objection as applies to most American reports of exploring expeditions: it is too full of matter. It would have added greatly to the clearness of the narrative had the interesting but irrelevant information regarding plants, animals, ethnology, and economic science been omitted, or at any rate relegated to an appendix. But the plan of the work of itself subjects the geological student to much needless labour: the districts are described separately, and, as an almost inevitable consequence, points of very unequal importance receive equal attention, while phenomena of minor interest are described more than once. This want of perspective is scarcely atoned for by the *résumé* given in the concluding chapter.

When Agassiz announced his opinion that the surface coverings of Brazil were due to extensive glaciation, Prof. Hartt was not alone in declining to give his assent to the startling doctrine. But though he now avows his former error, and has accumulated proof which seems well nigh irresistible in support of the theory of glaciation, he gives satisfactory evidence in disproof of the Amazonian glacier, and concludes his statement thus (p. 493): "It is with much hesitation that I express an opinion at variance with so distinguished an authority as Professor Agassiz: but the facts have seemed to need a different interpretation from that which he has given them. My conclusions, after all, do not affect his theory of the former existence of glaciers under the tropics, down to the present level of the sea—a theory which I hold as firmly as he." Agassiz' position as regards the surface geology of Brazil is in fact the counterpart of that which he held many years ago as regards that of Scotland. There he was the first to recognise the true glacial character of the boulder clay, and to solve satisfactorily a problem so oppressive as to have disturbed the slumbers of a leading Scottish theologian and geologist. No doubt his judgments as to one or two localities were afterwards reversed, just as a few species of fish have been otherwise placed since his great work appeared. But the correction of details does not affect his fame as the discoverer of the right method of investigation, and Professor Hartt shows that he rightly appreciates the value of detailed corrections.

The coast districts of Brazil are covered by a layer of variable thickness, consisting of a reddish unstratified clay, the materials of which are manifestly derived from the strata in the vicinity. This deposit is absent from the coast plains whose elevation does not exceed twenty feet, but, with this exception, it covers hill and valley alike. Nearly coextensive with this deposit is a layer of *cascalho*, the pebbles being chiefly quartz, more or less rounded. This sheet, of varying thickness, follows the inequalities of the surface, and occasionally presents accumulations of remarkable thickness; a combination of phenomena which precludes the notion of its deposit from water. The clay and *cascalho* were formerly confounded with what Agassiz asserted to be the surface of the subjacent rock decomposed in place, the heat and moisture of tropical regions affecting the strata to a considerable depth. Hartt figures at p. 508 a cutting where the surface deposits lie on decomposed gneiss, the partition line being distinct: he found that quartz veins in the gneiss, which had resisted the decomposition of the matrix, nevertheless did not pass up into the overlying deposits: further the clay and gravel sometimes rest directly on the bare rock in those drier regions in which decomposition has made small progress, or from which its results have been removed: again, while the clay frequently contains pebbles and blocks, more or less rounded, of various sizes, the decomposed mass wants such ingredients: lastly, while the former is thoroughly unassorted, the latter frequently shows clearly the stratification, the softening process having left undisturbed the relations of the parts. These are the main points of the argument, which goes to prove that in Brazil the atmosphere has power as an agent of waste to which our northern temperate regions offer no parallel. That the clay and gravel are not of aqueous origin, Hartt proves very satisfactorily, founding strongly on the absence of interstratification such as characterises the tertiary deposits over which also the clay and gravel occur. Exception may fairly be taken to Hartt's use of the term "drift" for this superficial deposit; he has himself proved that it is inapplicable, yet continues, as do many other writers, to use a word suggestive of erroneous theory: why not call it boulder clay? On one or two points the author is not sufficiently explicit, and I draw attention to them in the belief that his time and opportunities did not suffice for their thorough investigation, and in the hope that he may yet be able to inform European geologists on subjects on which their experience does not qualify them to decide. Part of the difficulty arises from the unfortunate circumstances that Professor Hartt has given little information as to the heights of the more important localities visited, and that no maps supply the details necessary for following him satisfactorily on his routes, those given in the volume having no pretensions to rank as general maps. Hence there is some difficulty in understanding the relation of the *cascalho* to the subjacent rock. The *canga* seems to be the representative of the *cascalho*, the former being, as in Minas Geraes, derived from and resting on clay slates, the latter characteristic of the gneissose districts. We have thus seemingly a local character of the surface deposits comparable to that recognised in the boulder clay of this country. But if so, how is it that both varieties of gravel seem to rest alike on rock decomposed in place? Professor Hartt speaks of the meteoric decomposition as having preceded the ice-period; of regions which, at the present day, being destitute of the vegetation which determines copious moisture,

present undecomposed rock at the surface, and specially notes that, as on the São Francisco, the clay diminishes towards the dry zone, the gravel layer increasing till it passes into a sheet of boulders. Possibly more detailed survey, such as Professor Hartt may yet undertake, will show that the locally characterised deposit passes eastwards beyond the area of the rocks whence it was derived, just as in the north of England and in Scotland; indeed something of the kind has been already recorded. Meanwhile the fact (if I have rightly collated the scattered passages) that the *canga* consists of solid pieces of ferruginous rock seems to suggest that the decomposition must have been in places subsequent to the date of the ice-sheet: that, as is suggested in the concluding chapter, pre-glacial decomposition may have occurred in the now dry regions and the converse, the travelling ice grinding away the soft, and carrying off fragments from the solid rock, to be left over surfaces afterwards softened; yet, if so, why are not the fragments also softened? But these are difficulties of detail which are only alluded to because their solution involves the thorough investigation of atmospheric waste as illustrated in Brazil. If the advocate of marine denudation can prove his case from Brazil, he will easily succeed in Britain. Meanwhile this volume shows that, speaking generally, the erosion of the water-courses follows the order suggested by Jukes, and illustrated by Geikie and others, the lowering of the watersheds whereby the great river-valleys of South America are well nigh opened into each other telling clearly of the backcutting power of streams. Le Neve Foster describes *moco de hierro* in Venezuela as a ferruginous alluvial deposit, beneath which lies a layer of blocks of vein quartz, with which is associated an auriferous clay: these deposits rest on *cascajo*, or rock decomposed in place. The superficial deposits Foster calls alluvial, yet their resemblance to the strata described by Hartt renders their origin a question of great interest.

One statement at p. 548 must be noticed, namely, that the equivalents of the Laurentian series are to be found in the coast gneiss, while further to the west the Silurians come on. Sir R. Murchison has already spoken of the possibility of Laurentian rocks occurring in South America; but Professor Hartt's observations and mode of reasoning do not instil much confidence in his conclusions. He relies altogether on lithological and mineralogical resemblance, and Dr. Sterry Hunt seems equally satisfied therewith. If anyone takes the trouble to compare the observations made in different districts, he will find that the recorded dips and strikes vary extremely, but the physical relations of the masses are not alluded to. It is said that the gneiss "becomes finer westward, and finally gives way to heavy beds of mica-slate, or mica-schistose gneiss with bands of quartz" (p. 549). Literally this would suggest a passage of less metamorphosed strata in the west into more altered beds eastward. If succession, especially if unconformable succession, is intended, the phrase is at least unhappy. Nor is the argument strengthened by the statement that gneiss is seen under the Brazilian table-land. The district is a very difficult one to explore, and hasty generalisations may be formed from the evidence of a few imperfect exposures. Hartt refers to Wall's paper on Venezuela, as evidence that a similar gneiss to that of Brazil occurs there: but Wall expressly says that the gneiss is a variation in a series which from its leading characters he calls one of micaceous and silicious schists, and which presents, in fact, a curious resemblance to the kind of transition suggested by Hartt's words just quoted. This series, the Caribbean, be it remarked, has been subjected to disturbance exactly parallel to that which has affected the older Parian or cretaceous rocks of Venezuela. Yet, founding on lithological character and parallelism of disturbance, Hartt classes the gneiss of Brazil and of Venezuela with the Laurentians of Canada. Whatever the probabilities may be, this book has done nothing to prove the existence of South American Laurentians.

The difficulties attending exploratory journeys in tropical regions explain and largely excuse the want of precision in many parts of Professor Hartt's book. I hope that he may have opportunity of revisiting the country, and filling in the details of the sketch outlined in this volume.

John Young.

SCHWEINFURTH'S JOURNEYS IN CENTRAL AFRICA.

Perhaps the most important advance which has been made in geographical discovery during the past year has been the exploration of a large portion of Central Africa, lying to north-westward of the great equatorial lakes, by Dr. Schweinfurth, already known through his botanical studies in the lower Nile valley, the first practised traveller who has penetrated far into this region. The reports of the ivory traders, Piaggia and the brothers Poncet, had already indicated the great interest of this part of Africa, but it has been left to the German traveller, in reaching a position nearer the equator in the centre of the continent than any European has before attained, to determine the limit of the Nile valley in this direction, and to cross the water-parting into a westward basin, presumably that of Lake Chad. As yet only the outline of Dr. Schweinfurth's discoveries have reached Europe.* The newly explored country lies to the south and west of the perplexing and variable entanglement of rivers and swamps which feed the White Nile from the west in its course between Gondokoro and the Bahr-el-Ghazal; through which Brun-Rollet, Petherick, Madame Tinné, and von Heuglin have wandered, without entirely unravelling its plan. Beyond this swamp region to the water-parting south-westward, the land traversed by Dr. Schweinfurth forms part of a great sandstone formation. Its surface has two sharply distinguished characters of vegetation; that of the deeply cut channels of its numerous rivers and streams, whose banks are thickly overgrown with tall trees; and that of the grassy, park-like steppes between these, with dwarf trees or clumps of bush. On the water-parting itself the aspect of the country changes and presents a system of bare and swampy flats, with a white sandy soil.

The ruling tribe of the inhabitants of the Nile watershed here is that of the Niam-Niams, who are described by the Marquis Antinori as men of powerful form and stately carriage, bronze-coloured skin, and long sleek hair. On crossing the water-parting into a fertile country, where the oil-palm gives a new character to the landscape, Dr. Schweinfurth came upon a race differing from these in every respect. The Abānga and Monbuttu of the inner watershed are distinguished by the lighter colour of their skin, and their blonde and frizzled hair is worn by both sexes in a high chignon. Though inhabiting a richer land than the Niam-Niams, and in advance of them in agriculture, and the arts, cultivating the banana and other fruits, trading in copper, and forging weapons in iron, the Monbuttu rank far beneath them in the scale of humanity, since they indulge in cannibalism to an extent which appears to be unparalleled on the globe, a practice in no way explicable here by necessity, since the land abounds in game of all kinds. To the south of the Monbuttu is a dwarf race named Ackā or Ticki-Ticki; the average height of the men of this tribe is five feet, but many do not reach this measure. The most southerly point reached by Dr. Schweinfurth is in lat. 3° 35′ N., long. 27° 5′ E. of Greenwich, 2500 feet above the sea, and three days' journey to S.S.E. of the Niam-Niam chief Kifa's (now his son Kanna's) residence, the extremity of Piaggia's route. Here is the palace of Munsa, the chief of the Monbuttu, compared by the traveller to a middle-sized railway station in bulk and form. This capital is south of a great river, named Uēlle both by the Niam-Niams and the Monbuttu, which is as large as the Blue Nile in summer at Chartum. It is formed near 28° E. long. by the confluence of the Gādda

* In letters received at Gotha (20th Nov. 1870), and published in Petermann's *Mittheilungen*, and in a communication to the *Cologne Gazette*.

and Kībali, the latter apparently springing in the neighbourhood of the sources of the Tonj, on the inner side of the mountains which enclose the Albert N'yanza. Farther on in its westward course the Uēlle is said to receive two large tributaries from the south, and an affluent on the right bank, which Dr. Schweinfurth believes to be the river of Senā reported by von Heuglin. The Uēlle, which is navigated by native canoes of 30 feet in length and 6 feet broad, is the Bari or Babura river of the brothers Poncet, and since it maintains a north-westerly direction into the land of the Mohammedans, the "clothed people who pray on the ground," it is scarcely to be doubted that it is the upper course of the Shari river, the main supplying stream of Lake Chad. Piaggia and the Poncets report this river as flowing out of a great lake. Brun-Rollet and von Heuglin each heard of a great lake in this region, and from these reports, especially from the apparently exact information of Piaggia, a fourth great equatorial sheet of water, of an extent rivalling the Victoria Lake, has been represented on recent maps to north-westward of the Albert N'yanza; but for the reasons, that the confluence of so many large streams to form the Uēlle, show that it is rather a mountain-born river than the outlet of a lake; and that though he came within a day's journey of the position given by Piaggia to its northern shore, he could nowhere find any one who had seen or heard of the lake at all, Dr. Schweinfurth throws strong doubts on its existence. Still some weight must be given to the independently received information of the four travellers above named, and the question of the existence of this lake is still to be solved.

Thus the opening up of the African Continent is at last proceeding with rapid strides. The details of this journey, and of those which Dr. Schweinfurth was on the point of undertaking when his letters were despatched, will give the accurate geography of a large portion of the western side of the Nile valley; the corresponding eastern half in these latitudes is now being penetrated by the great discoverer, Sir Samuel Baker, with his Egyptian forces, and if, above all, there shall be added to this the long pent-up store of African knowledge which Dr. Livingstone now jealously guards, Inner Africa will no longer be counted among the unknown parts of the globe, and the time of great discoveries will be nearly at an end.

KEITH JOHNSTON, JUN.

Scientific Notes.

Natural History and Physiology.

The Wing of Bats.—In Max Schultze's *Archiv*, Band vii., 1tes Heft, is a most exhaustive and interesting paper on the structure of the bat's wing, by Dr. Jos. Schöbl, of Prague. Long ago Spallanzani discovered that bats which had had their eyes put out were able, nevertheless, when allowed to fly about in a room, to avoid threads stretched across it. This faculty he attributed to some highly developed sense of touch possessed by the wing. Dr. Schöbl has repeated these experiments; but for the putting out of the eyes he has substituted the less painful method of covering them with sticking plaster. He has kept bats thus treated for a year alive in his room, and has entirely confirmed Spallanzani's results. To account for these phenomena, the wings of bats have been examined for peculiar nerve-endings by Cuvier, Leydig, and Krause, but without any success. The author's discoveries are therefore quite new to science. The following is a short abstract of his results. The bat's wing membrane consists of two sheets of skin, the upper derived from that of the back, the lower from that of the belly. The epidermic and Malpighian layers in each sheet remain separate, whilst the true skins are inseparably fused. In this fused median layer are imbedded the muscles, nerves, vessels, &c., of the wing. A complicated arrangement of delicate muscles is described, which have their tendons formed of elastic tissue instead of the usual white fibrous tissue. There are also present numerous long elastic bundles stretched in different directions in different regions of the wing. The arteries are each accompanied by a single vein and a nerve, the three keeping company as far as the commencement of the capillary system. With regard to the pulsation in the wing, Dr. Schöbl has nothing new to add to the observations of Wharton Jones and Leydig. The whole wing is covered, both on the upper and under surface, with extremely fine, sparsely scattered hairs. These hairs are most numerous on the inner third of the hinder part of the wing, and they gradually decrease in number towards the tip. The two wings taken together contain from 8000 to 10,000 of them. They have a general resemblance to those on the body, but are simpler in form. Their length is about 0·2500 mm. in *Vesperugo serotinus*, the species principally made use of in these investigations. Each hair sac has from two to seven sebaceous glands, according to the species; and one sweat gland opening into its sac. The two outer fibrous layers of the hair sac have no sharp line of demarcation to separate them from the surrounding connective tissue, but the inner or hyaline coat is highly developed, and, after being constructed beneath the hair bulb, widens out and encloses the Tastkörperchen, one of which organs is connected with each hair.

The nerves of the wing may be considered to consist of five layers, *i. e.* there is one occupying the centre of a transverse section of the wing, which gives off on each side of it four others, and these are successively finer and finer as they approach the opposite surfaces. The inner layer and the one immediately on each side of it consist of nerve fibres with dark borders, the other layers of pale fibres only. The Tastkörperchen are connected with the second layer. The fifth layer of finest fibres ends as a network between the innermost layer of cells of the Malpighian layer of the epidermis. The Tastkörperchen are shaped like a fir-cone, with a rounded apex turned inwards. They lie immediately below the root of the hair; and their core or central substance is formed of a prolongation of the cells forming the two root-sheaths of the hair. Their length is 0·0259 and their breadth 0·0175 mm. A nerve containing about six dark-edged fibres is distributed to each Körperchen. Just before the nerve reaches this organ, it splits into two, and three fibres pass to one side of it, three to the other. The fibres are then wound round the body so as to sheath its cellular core. Dr. Schöbl thinks it probable that the fibres on one side are continuous with those on the opposite side, and that there is thus a bipolar arrangement here. He attributes to the fine network of pale nerve fibres belonging to the fifth layer the appreciation of temperature, pain, &c.; to the Tastkörperchen the highly exalted sense of touch. It is curious that both kinds of nerve endings are connected with the Malpighian layer of the skin. In conclusion, the author states that he believes he has found similar bodies in peculiarly sensitive places in other mammals, and promises an early account of them.

Habits of the Fur-Seals.—Mr. J. A. Allen gives in the *Bulletin of the Museum of Comparative Zoology at Harvard College*, vol. ii. No. 1, an interesting account of these little-known animals, the *Otariidæ*, or Eared Seals, from which the seal-skins of commerce are obtained. The fur-seals resort in large numbers to the Pribyloff Islands, off the northern part of the Alaska Territory, in the summer months for the purpose of breeding. It is estimated that not less than 1,152,000 male and female seals take up their abode in these "breeding rookeries," as they are termed. Each male has about ten or fifteen wives, the older males always driving off the younger ones, who retaliate by stealing the wives of the patriarchs while they are asleep, carrying them off in their mouths. Constant struggles are the result, in which the females often get severely lacerated. All the males have assembled at these breeding-places by the 15th of June: the females only then begin to arrive, and are not all collected till the middle of July. By the middle of August the young are born; the old males, who have remained at their station the whole of this time without food, now go off-shore in company with the younger ones to feed; and at the end of October the whole body of seals leave the island and journey southwards. The only seals killed for the sake of their fur are the younger males, great care being taken by the hunters not to disturb the remainder in any way.

Mode of Life of the Sucking-Fish and Pilot-Fish.—Professor Van Beneden has ascertained the nature of the food of these two forms of fishes. The sucking-fish has sometimes been supposed to derive its nourishment from the sharks, to which it attaches itself by the curious apparatus on the crown of its head. M. Van Beneden finds that the common sucking-fish (*Echeneis remora*) feeds upon small fishes. From an examination of the contents of the stomach in several examples of the pilot-fish (*Naucrates*)—it would appear that this fish is omnivorous—the food consisted of portions of fishes, crustacea, fucoid plants, and, in one instance, parings of potatoes. These observations have been communicated to the Royal Academy of Belgium.

The Physiological Laws of Human Increase.—An interesting pamphlet has just been published in Philadelphia from the pen of Dr. N. Allen, of Lowell, Mass., on the Physiological Laws of Human Increase, especially bearing on the American population. He states that his attention was directed several years ago to the change taking place in the native population of Massachusetts and other New England States, showing that, whilst the immigrant Irish, English, and Scotch women had large families, the American women had so few children that it was becoming more and more a doubtful question whether in point of numbers the stock was kept good. In a review of Dr. Allen's work in the *Amer. Med. Journal* the fact is put in a still stronger manner. "By a census of the people of Massachusetts taken in the year 1765, it appears that of the entire population nearly fifty per cent. were under sixteen years of age, while at the present time not more than twenty-five per cent., if so many, are under that age; while at the former period the average number of offspring to each couple amounted to from eight to ten, at the present time it scarcely exceeds three." In the foreign part of the population, again, the number of children to each family outnumbers nearly threefold what it is among the native stock.

Dr. Allen discusses the various causes that have led to this remarkable result, and considers that the real cause is to be looked for in a modification of the vital powers of the American women, and the cause of this deterioration he finds in the important changes that have taken place in the education, domestic habits, occupations, dress, and amusements of the female sex especially.

Geographical Distribution of Diseases.—A series of essays of more than ordinary general interest are now in course of publication in the *British Medical Journal*, by Alfred Haviland, and are entitled "Lectures on the Geographical Distribution of Diseases in England and Wales." The one before us on phthisis is strikingly illustrated by a coloured map, and we append some of the conclusions which have been arrived at. 1. More than a quarter of a million of females died from phthisis during the decade 1851–1860. 2. The divisional distribution of heart-disease and phthisis is shown to be the reverse of one another. 3. The most exposed divisions have the highest mortality in phthisis, and the lowest in heart-disease. 4. The most sheltered divisions have the lowest mortality in phthisis, and the highest in heart-disease. 5. London and the West Midland division have the lowest female mortality, being only 24·9 to every 10,000 living. 6. The division having the highest mortality is the North-Western Counties. This fact is coincident socially with the engagement of the population in cotton and other factories, and climatically with exposure to the direct and powerful influence of the north-westerly winds. The maps of heart-disease and cancer show an exceedingly low mortality from these causes in this division. 7. In heart-disease and cancer Wales has a remarkably low mortality, whereas in that of phthisis a high mortality is depicted. It ranks next to that of the north-western division, its female death-rate from phthisis being 32·0 or 4·3 to every 10,000 living *above* the average.

Structure of the Glands of the Stomach.—A valuable paper has been written by Prof. Heidenhain, on the structure of the gastric or peptic glands, and is contained in the 6th vol. of Schultze's *Archiv für microscop. Anatomie.* Heidenhain's investigations were carried on in dogs, the mucous membrane of whose stomach was hardened in alcohol, stained with carmine or aniline-blue, and examined with moderate microscopic powers. The glands are arranged singly like palisades or in groups like the fingers of a glove, in close proximity to one another, and he distinguishes the orifice, the neck, and the body in each. The orifice in the grouped glands resembles the hand part of the glove, several glands opening into it, just as the fingers of the glove open into the wider hand part. This is lined by columnar epithelium. The neck, or narrower portion of each tube, is lined by roundish coloured cells. The body is lined by two kinds of cells, one external or marginal, round, and coloured, the other small, internal, and uncoloured, though their nuclei sometimes become tinted; the former he calls investing cells (Belegzellen), the smaller uncoloured ones he names chief cells (Hauptzellen). The former probably represent the peptic cells of previous writers. The lumen of the glands is occupied by granular dark material. He describes with full details the action of various reagents upon the two above-mentioned forms of cells. He then furnishes the results of his researches on the glands during digestion. The glands are found to become increased in size. The chief cells are much swollen, and their contents finely granular, showing that they have absorbed more than they have secreted; the investing cells are less altered. No division or multiplication of cells was observed.

Glycerine Extracts of Pepsin and other Ferments.—Dr. M. Foster calls attention in *Nature*, Dec. 29, to the value of glycerine as a new means of working out the intricate problems of so-called ferments. Dr. Foster has confirmed the statement of von Wittich, published a short time since in *Pflüger's Archiv*, that, if the mucous membrane of a pig's stomach, washed and freed as much as possible from water, then finely minced and bruised, and covered with pure glycerine, is allowed to stand for twenty-four hours, a few drops of the glycerine, diluted with acidulated water, will digest fibrin with remarkable rapidity. On heating this glycerine extract, after filtration, with a large excess of alcohol, a slight precipitate is obtained, which, separated by filtration and re-dissolved in acidulated water, though giving only the faintest proteid reaction, is strongly peptic. The glycerine extracts appear to remain unchanged for a very long period, so that a stock of ferments can always be kept in store.

Physics.

On the Tension of Saturated Vapours.—Ever since the publication of Regnault's classical researches into the laws of the elasticity and expansion of gases, it has been recognised that the so-called laws of Boyle and of Gay-Lussac express properties which do not correspond exactly to those of any known substance, but to which the properties of the uncondensible gases make a near approximation, especially at high temperatures and low pressures. It has also been long known, from the experiments of Regnault, Cahours, and others, that the more easily condensed gases, and the vapours of substances which are solid or liquid at common temperatures and pressures, approximate more and more closely to the state of perfect gases, or conform more and more nearly to the above laws, as they are farther removed from the condition of saturation. Beyond this very little has been known, until recently, of the behaviour of vapours in relation to pressure and temperature. An important step has, however, been made within the last year or two by Dr. Hermann Herwig (*Poggendorff's Annalen*, 1870, No. 9; also vol. cxxxvii. [1869]), who has shown that, at least in the case of several vapours—namely those of alcohol, ether, chloroform, water, ethylic bromide, and carbonic sulphide—a remarkable law holds good, which may be thus stated. If a quantity of vapour, not in contact with liquid, be subjected to continually smaller and smaller pressures while the temperature is kept constant, a point is reached sooner or later beyond which the product obtained by multiplying the pressure by the volume occupied by the vapour no longer varies appreciably—that is to say, a point beyond which the vapour sensibly obeys Boyle's law. But if now the pressure be increased up to the greatest pressure which the vapour can support at the temperature of the experiment, so that the vapour becomes saturated, the product of this pressure into the corresponding volume bears to the constant product previously mentioned a ratio which is inversely proportional to the square-root of the temperature of the vapour measured from the absolute zero, and which does not depend upon the nature of the vapour. To express the matter mathematically, let v be the volume occupied by a given mass of vapour at the constant temperature t, and under the pressure p so small that the vapour behaves as a sensibly perfect gas; and let v' be the volume occupied by the same mass of vapour at the same temperature, but under a pressure p', the greatest it can support without undergoing partial condensation, then Herwig's law is represented by the equation—

$$\frac{pv}{p'v'} = 0{\cdot}0595\ (a + t),$$

where a is the reciprocal of the coefficient of expansion of a perfect gas.

On the Discharge of Statical Electricity.—The effect of coiling a conducting wire carrying an electric current round a core of soft iron has been very happily described as conferring the property of *inertia* upon the current. Some remarkable facts have been discovered by von Bezold (*Poggendorff's Annalen*, 1870, No. 8) in relation to the discharge of statical electricity, which tend to show that the charge of a Leyden jar, or condenser, or any equivalent arrangement, may be conceived of as having both inertia and *elasticity*. The details of von Bezold's experiments could not well be made intelligible without the aid of figures and a long description: the following is his own epitome of the general results:—1. If an electric discharge which has traversed a space of air, so producing a spark, has open to it two conducting paths to the earth, a shorter one and a longer one, the latter being interrupted by a non-conducting plate, the farther side of which has a metallic coating connected with the ground, a division of the discharge takes place if the striking distance is small. But if the length of the spark is increased, the electricity follows, on the other hand, only the shorter path, and even carries electricity with it from the other branch. 2. If a series of electrical waves are sent into a conducting wire whose farther end is insulated, they undergo reflexion at the end, and phenomena, which accompany the process when alternating discharges are used, seem to owe their origin to the interference of the direct and reflected waves. 3. In wires of the same length, an electric discharge is transmitted in the same time, without regard to the material of which the wires are made.

History.

The History of Scotland, from Agricola's Invasion to the Revolution of 1688. By John Hill Burton. Vols. V. VI. VII. Blackwood.

English History owes more, perhaps, to the historians of the sister nation than has been acknowledged. It is the fashion now to abuse Hume, but the summaries which he gives at the end of each reign are still very valuable for their social and economical views, and not a few passages of the history itself have much of the merits of his political essays. The claim of England to the vassalage of Scotland forced Scotch enquirers to scrutinise the sources of our early history very closely, and the result was that a considerable amount of forgeries was detected, which had imposed on English statesmen even down to Elizabeth's days. Mr. Burton repeatedly points out how the queen and her statesmen were influenced by their belief in the English supremacy. Rymer, the editor of the *Fœdera*, began his great work most unfortunately by engraving a document purporting to be Letters Patent, in which Malcolm Canmore acknowledged that he held Scotland and the adjacent islands of Edward the Confessor by liege homage, an ancient forgery which the Scotch at once detected and exposed. Mr. Burton, who has written an excellent *Life of Hume*, and a *History of Scotland since the Revolution*, has followed Hume's example in taking the earlier portions of the history last, a plan which in some respects may be serviceable. He has had the advantage of having the ground cleared for him by the late Mr. Robertson's *Scotland under the Early Kings;* the portion of which the merit belongs more largely to himself, and which is particularly valuable for its impartiality, is that relating to the Stuart dynasty. It is of course hopeless to please those who make Mary Stuart an object of romantic and idolatrous worship, but they should be content with the ideal Mary Stuart whom Scott and Schiller have made immortal as a creation of the heart, and not be angry when the historian refuses to acknowledge romance as history and rejects the view of those who look on Mary as a saint, as he rejects the other extreme view, which regards her as the foul witch Duessa, who, in the *Faëry Queen*, is alternately the false woman and the false church. In one point Mr. Burton seems to us to make more allowance for Mary than Mr. Froude. If history must condemn her, yet let not even in this extreme case the extenuating circumstances be forgotten. She was less than twenty-six years of age when the English prison doors closed on her, and she had lived as Queen of France and Scotland when social life in those countries was at its worst; her husband was utterly worthless, and had assassinated Rizzio in her presence, and she must have been almost more than human if she had escaped her terrible fall. As a passionate woman and as a Catholic devotee, who did in a sense die for her faith, she will still carry with her a sympathy which the historian himself cannot and does not wish to entirely suppress. On the other side, Mr. Burton seems to us eminently fair as regards Elizabeth. Mary's friends see in her nothing but a subtle foe. Mary herself knew better. Elizabeth thought that nothing could justify subjects in rising against their sovereign, and she honestly endeavoured to keep Mary on the throne till it became impossible. If any one had a right to complain of the English queen's conduct, it was Murray and the leaders of the Scotch Kirk. She meant, too, that Mary should succeed her, and would have befriended her all along; but she found that Mary regarded her as illegitimate, and herself as already rightful Queen of England, and that to declare Mary her successor would be to sign her own death warrant. Let us make the allowance for Elizabeth that we make for Mary; far less allowance is needed, far less is usually given. Elizabeth too suffers in another way. Spenser could represent the *Queen of Faëry* sending out her knights to relieve fair Belgé, or help Sir Burbon, or execute strict justice through the realms of Irena; but history finds that the queen was with difficulty brought to carry out any great measures, and that the credit is largely due to Cecil and Walsingham and the famous English sea captains of the age. But though the monarchical fashion of writing history has almost disappeared, yet Elizabeth cannot lose her fame, for she carried England safely through the great crisis of religious change without a religious war. We have but to think on the condition of the continent at the time, we have but to contrast Elizabeth with her predecessor and her successor, with Mary Tudor and James VI., to see why England, why even the most violent of the Puritans, clung loyally to her rule. Nor is Mr. Burton less fair to a much reviled class of men, the Scotch Covenanters. The Solemn League and Covenant sealed the cause of freedom in Scotland (we may trust the feeling of Burns rather than that of Sir Walter Scott on this subject), and should have been not less celebrated than the oath of Grütli for Switzerland, or the vow of Joan of Arc for France. But history, "so warm on meaner themes, is cold on this. She execrates indeed the tyranny that doomed them to the fire, but gives the glorious sufferers little praise." These words represent the impression made on Cowper's mind by reading Hume's account of the persecutions in Scotland under the Stuarts. But the Puritans lived in the agony of too great a crisis to have been able to be friends with the literary class, and they have suffered accordingly in literature. Mr. Burton has given us a chapter on "Social Progress from the Reformation to the Restoration," which will well repay perusal. It is sometimes said that the history of a country is imperfectly written if it do not in the narrative reveal the social condition of the people brought forward to act upon its stage. This may be so, but most narrators are apt to feel that there are characteristics of a people too placid and leisurely in their growth to be easily put into companionship with others born of violence, fanaticism, or craft. This is Mr. Burton's apology for the chapter, but its merits need no apology. He has rightly taken the literature as reflecting the character of the people. It was a Scotchman who first said that if a man were permitted to make all the ballads, he need not care who should make the laws, of a nation, and in ballad literature Scotland is peculiarly rich. To criticise their origin is as difficult as to criticise that of the Homeric songs: they grew and fell into shape as they passed from generation to generation by tradition, and Burns and Scott did but complete the work of many unknown poets. For the manners of the country, Robert Chambers has collected much

material in his well known book, the *Domestic Annals of Scotland;* our author can but give a summary. The darkest stain on the age is the superstition of witchcraft, an evil heritage from the Middle Ages. King James's *Daemonologie* is a true Scotch work; Scotch lawyers treated sorcery as a crime long after English commentators regarded it as an obsolete belief, and many religious men were vehemently opposed to the repeal of the disgraceful penal laws against witchcraft in 1736.

After all, the true history of the nation is its history as a people, and Mr. Burton has done justice to John Knox as having to a great extent created modern Scotland. The Kirk system of national education gave Scotchmen a great advantage for a long time over other nations, and the Presbyterian scheme of church government requires careful consideration if the real nature of Scotch history is to be understood. For the causes which led to the downfall of the old church system, we may refer to Mr. Froude's late article in *Fraser*. Both sides contended that their view rested on express divine authorisation; the historian accepts various forms of government as lawful in the church, just as he recognises monarchy, aristocracy, and democracy in the state, and sees that they are equally human and divine.

Mr. Burton passes lightly over the consideration of the morality of Scotland, but the question is surely important to an enquirer into its history, and we should have liked some comparison with the Scandinavian kingdoms on the one side, with England and Ireland on the other. In constitutional matters, too, we are not quite satisfied with his account of the Scotch Parliament; the passages about it are very scattered, and we have nowhere the advantage of reading Mr. Burton's views in a connected form. But the work as a history of Scotland is far the best we have, the critical power is conspicuous, and the literary merit of a clear style gives it a by no means inconsiderable advantage over some of its rivals. The author has avoided as much as possible the temptation to trench on the ground already occupied by English historians. When Mary crosses the frontier, he quits her company, and shuns entering the enchanted ground. The tangled web of plots and counterplots, the final struggle, the great death scene at Fotheringay, all these he leaves to the English writer who has already made them his own. In this way, however, his work appears somewhat at a disadvantage. When once the crowns are united, the histories can no longer be kept entirely separate; the contest of the Stuart kings with the two nations forms a drama which falls into separate acts, but the acts are but parts of the whole, and can hardly be treated apart. In one sense the Scotch are still a nation, but their later national history and our own, though they may be distinguished, yet hardly admit of separation.

C. W. Boase.

THE FASTI OF THE LATIN FESTIVAL.

Through the kindness of Professor Mommsen we are able to give by anticipation the following account of some newly discovered fragments, and of the criticism of them which he has written for the next number of *Hermes*.

The most interesting fragment is one which contains the years 304–306 U.C., and is therefore much older than any yet found. The others belong to the years 537–542, 552–554 U.C., and 40–43 A.D. The most important entry, as restored by Mommsen, is as follows: it is that of 305 U.C., the year after the fall of the Decemvirate:

M. Horatio M. f. L. n. Barbato L. Valerio P.F.P.N.PUTITO COS.
L(atinae) f(uerunt) IIII. EID. IAN.
*ite*R(*um*) L(*atinae*) F(*uerunt*) III. NON. FE*b*R
tertium L(*atinae*) F(*uerunt*) K. MAI

The festival was therefore celebrated three times in that remarkable year, viz. Jan. 10, Feb. 3, and May 1. The first of these days is much earlier than was the rule in later times; but it fits very well with the day on which, according to tradition, the magistrates entered upon office after the fall of the Decemvirate, namely, Dec. 10 for plebeian tribunes, and Dec. 13 for *magistratus populi*. It was a sacred rule that the consuls must hold this festival before taking the field.

The intimate connection thus made out between the festival and the commencement of the official year further explains why the institution was ascribed to Tarquinius Superbus. The Fasti could only be reconstructed as far back as the annual magistracy supplied a ground for fixing the time of celebration. Afterwards, probably in 532 U.C., the day for entering office was fixed for March 15: and according the festival about the time is usually held in May. But when the official year in 601 B.C. was made to begin on Jan. 1, the time of the festival was not again altered.

The occasional repetition of the festival is now ascertained; and Prof. Mommsen is thus able to fix the reading of a passage in Livy, xlv. 3, 2, in which a second celebration is mentioned as having taken place in consequence of the victories in Macedonia. Another took place in 731 U.C., probably on the occasion of the assumption of the tribunicia potestas by Augustus. If the repetition in 305 U.C. were in honour of the restored liberties of the *plebs*, as seems likely, it is curious that, as Mommsen says, the same festival should have been held "at the second birth and over the grave of the Roman republic."

Other inscriptions have been found on the same place, among them one containing the terms *Cabenses sacerdotes feriarum Latinarum montis Albani*. The modern name Monte Cavi is thus traced back probably to the time of the Emperor Tacitus.

These results confirm and supplement the views which Professor Mommsen expounded in his recent essay on Sp. Cassius, M. Manlius, and Sp. Maelius. The chronology, the dry bones of history, extends much further back in the case of Rome than anything which can be called historical record: and it supplied the framework which legend and fabrication filled out with the existing narrative.

Syntaxe Nouvelle de la Langue Chinoise, fondée sur la Position des Mots, suivie de deux Traités sur les Particules, et les principaux Termes de Grammaire, d'une Table des Idiotismes, de Fables, de Légendes et d'Apologues traduits mot à mot. Par M. Stanislas Julien. Paris: Librairie de Maisonneuve; London: Trübner and Co., 1869.

Dictionnaire Français-Latin-Chinois de la Langue Mandarine Parlée. Par Paul Perny, M.A. Paris: Librairie de Firmin Didot Frères, Fils et Cie, 1869.

No living sinologue has done so much to familiarise the people of Europe with the language of China as M. Julien. During the last forty-seven years he has entirely devoted himself to the study of Chinese, and beginning with a Latin translation of the works of Mencius, he has from the year 1826 down to the present time continually furnished students of that tongue with text-books which for correctness and utility are quite unsurpassed. His present work is perhaps of all his publications the greatest boon to would-be sinologues. The difficulties which surround the acquirement of even a moderate knowledge of the *koo wen*, or

"antique style" are very considerable. The construction of its sentences and the characters used are entirely unlike those employed in the modern colloquial, the official, and the epistolary languages; and although an acquaintance with the latter styles is at first of greater moment to the official and missionary students in China itself, the fact that all works which can claim for themselves any importance are written in the *koo wen* makes a knowledge of it the one thing necessary for European sinologues. To the study of this branch of the language M. Julien has directed his entire energies, and the work before us, discarding any pretensions to being a complete grammar of Chinese, professes only to deal with that particular style of composition. Chinese has never attracted in England the notice to which its richness and great antiquity entitle it, and this may be attributed in a great measure to the want of sure guides in the shape of dictionaries, grammars, and text-books which has hitherto been felt. Now, however, this deficiency has been to some extent supplied.

To the early works of M. Julien, and the recent translation of the classics by Dr. Legge, has been added the valuable grammar and text-book before us. A thoroughly good dictionary is still much to be desired, and we trust that we may look, at no distant date, to the appearance of such a one from the same hand which has now supplied us with the *Syntaxe nouvelle*. In making these remarks we would not have it supposed that we in the least undervalue the dictionaries of Messrs. Morrison and Medhurst, to both of which every student of Chinese must be deeply indebted; but it must be patent to every one possessing any knowledge of the subject, that a fuller and more complete dictionary than any yet published is much wanted.

Chinese characters are, as M. Julien informs us in his introduction, monosyllabic, indeclinable, and "inconjugable." Neither are they susceptible of inflections such as those by which the numbers, genders, and cases of nouns, and the tenses, modes, and persons of verbs, are in European languages recognised. Further, the language is destitute of what in the ordinary sense is known as grammar. At first sight the difficulty of acquiring a knowledge of a language suffering under such disadvantages would appear insurmountable. But a little reflection will show that a nation which has possessed a wide and ever increasing literature for upwards of 2000 years must be guided by fixed rules in the manner of its composition. Although up to this time these rules have never been clearly laid down, they have still existed, and are to be found in the amplification of the discovery first made by Dr. Marshman, and adopted as a motto by M. Julien, that "the whole of Chinese grammar depends on position." This axiom is the key to the written language, for by their position alone is it possible to determine the value of the characters in a sentence. This being so, we have only to add that a large proportion of Chinese words are interchangeable as either substantives, adjectives, or verbs, according to the relative positions they occupy, to show how all-important a careful adhesion to this principle becomes to enable students rightly to understand the works of Chinese authors. To illustrate practically the rules by which to distinguish the grammatical significance of Chinese words, M. Julien gives us a number of examples of the changes which take place in the value and meaning of the same characters as the result of their different position, or of the connection in which they occur. For instance, he tells us that the character 治 *tch'i*, "to govern," if placed before a substantive remains a verb, as 治 國 *tch'i kouĕ*, "to govern a kingdom;" if the order of these two characters is reversed, they signify, "the kingdom is governed;" and if the character *tch'i* be placed after 史 *chi*, "a magistrate," it becomes a substantive, and the two words are then to be translated, "the administration of the magistrates." We will further quote one example of the changes that some words undergo in the same sentence. For instance, we find the expression 以 鑽 鑽 之 *i tsouan tsouan tchi*. The primary meaning of the character *tsouan* is "an awl," or anything with which a hole is bored; and in this sentence we recognise that, since the first *tsouan* is preceded by *i*, the sign of the instrumental case, it stands in the place of a substantive; *i tsouan*, therefore, means "with an awl;" but the character *tchi* being plainly the object of a verb, the second *tsouan* must, by virtue of its position, be considered as a verb, and the sentence will then read thus, "with an awl to bore it" (*tchi*).

From what we have already said, it will be obvious that any work on Chinese grammar must resolve itself rather into a list of examples than a compilation of rules. M. Julien does, however, deal separately with substantives, adjectives, verbs, and adverbs, and by the addition of certain affixes and prefixes declines the substantives, and to some extent conjugates the verbs. By far the most important chapter in this part of the work is that which treats of the signs of the accusative case. To M. Julien, without doubt, belongs the credit of having discovered the value of the characters 以 *i*, 於 *yu*, 于 *yu*, and 乎 *hou*, as marks of the accusative. In a supplementary treatise to his translation of Mencius, he announced this grammatical discovery, and in his present work he brings forward such a number of thoroughly well-selected examples to prove his case, that even those least willing to accept his dictum must be convinced of its accuracy. M. Julien has the great advantage of possessing a knowledge of Manchoo. This being a Tartar language differs widely from Chinese in construction as well as in every other respect, and the power of comparing therefore the two versions of the same works—for all the classical works of China have been translated into Manchoo—furnishes him with obvious facilities for disentangling with certainty many points which must remain doubtful to those learned in Chinese alone. Thus to all the examples he gives us of the above characters as marks of the accusative case, he is able to point in the parallel passages in the Manchoo versions to the fact that they are invariably translated by *be*, the sign in Manchoo of the accusative.

The pages devoted to the *syntaxe* of the language form but a very small portion of the work before us, and are followed immediately by two chapters on "Monographs," or, as M. Julien further describes them, those "caractères qu'on rencontre à chaque pas avec des significations infiniment variées." These characters form one of the chief stumbling blocks in the way of translating Chinese. They cannot, strictly speaking, be said to belong to any one part of speech, but due regard being had to the rules of position, they are capable of changing their grammatical value to an almost indefinite extent at the will of the writer. One or more of them occur in every sentence, and not only are their meanings "infinitely varied," but are often so directly contradictory that the utmost care and considerable experience are required to enable the student to fix with certainty their significance in each case. As an illustration of this difficulty we may quote the character 以 *i*, which is perhaps the most common and most puzzling of these monographs, and for which M. Julien gives us thirty-four dif-

ferent meanings, besides the use which we have shown above to attach to it as the mark of the accusative case. In the first chapter on monographs, M. Julien reaps for us the benefits of his own experience in the course of his varied reading, but the second chapter is a translation of part of a Chinese work which we believe to be unique of its kind, entitled *King chuen shĭh tsze*, by Wang Yin-che. This work was first brought to the notice of M. Julien by Dr. Legge, through whose instrumentality also a copy has been recently added to the Chinese Library at the British Museum. It is impossible to overestimate the importance to the student of Chinese of a thorough comprehension of the "monographs." Former writers on the language have treated of them but very superficially, not that their importance has been overlooked, but for the simple reason that the great variety and depth of reading necessary to the thorough elucidation of their ever changing values, and possessed by the author of the *Syntaxe nouvelle*, has been wanting in the case of his predecessors. Of equal importance with the chapters on monographs is the table of idioms which follows them. To these parts of M. Julien's grammar we commend the earnest attention of the student. In them, as well as in the rest of the work, we have the result of the life-long study of a scholar who, after but three years' acquaintance with Chinese, published an excellent translation of one of the most difficult works in the language. The translations also which supplement the *Syntaxe nouvelle* give every opportunity to the student to put into practice that which he will have learnt in the earlier parts of the work. Every line in M. Julien's book contains valuable information. He places before the beginner in a fair and by no means exaggerated light the difficulties which will surround his onward path, and at the same time supplies him with a sure method of overcoming them. From first to last it is an excellent work, and one with which every student of the language should make himself thoroughly acquainted.

A very different kind of work from that referred to above is M. Perny's *Dictionnaire français-latin-chinois*. No more difficult linguistic task exists than the compilation of a thoroughly useful dictionary of Chinese. The knowledge required for its accomplishment must of necessity be encyclopædic, and the scholarship of the author should be beyond question. But in the work before us we can find little trace of either of these qualities. M. Perny appears from the tone of his preface to have set about compiling his dictionary with but a very slight appreciation of the responsibility he was thereby incurring, and the result has been the production of a very faulty book. The knowledge he displays of Chinese is comparatively slight, and his ignorance of Latin is astonishing. On one point we can, however, heartily congratulate him. The Chinese type employed in printing his dictionary, which he tells was the work of his own hands, does infinite credit to his patience and ingenuity. It is very clear, the characters are well proportioned, and the general execution is excellent. M. Perny informs us in his introduction that this dictionary is to be followed by the appearance of a Chinese grammar, and a book of Chinese proverbs. The last-named we have not yet seen, and the grammar is, we believe, not yet published. We can only hope that the experience M. Perny must have gained in making his dictionary will have led him to bestow greater care upon the composition of his other works.

Robert K. Douglas.

Studies on Plato. [*Platonische Studien.* Von M. Vermehren.] Leipzig, 1870. 164 pp.

Professor Vermehren's contributions to the criticism and explanation of Plato, contained in the present volume, will be welcomed by all those who are aware that I. Bekker's edition only inaugurated, but by no means concluded, the critical study of that author. It would be unnecessary to put the statement in such guarded terms but for the large number of *English* scholars who seem to be actually of opinion that criticism has no longer anything to do with Plato, his text having (as they think) been brought into a satisfactory shape by the German editor. But the truth is that Bekker's edition, far from exhibiting a satisfactory text, only furnishes the means of forming it; the most important MS. of the greater half of Plato's works (the Bodleian) not having fallen under the editor's notice until his text was printed off. This defect, it should be added, was remedied in the Zürich edition and in C. F. Hermann's text in the Teubner series, in which the Bodleian MS. was duly followed as the most important guide in the criticism of those works which it contains; but still much was left to be done in the way of critical accuracy, as neither the Zürich editors nor Hermann took the trouble of recollating it. This remains to be done now, and we are glad to hear that the work has lately been taken in hand by a gentleman already known for some contributions to Platonic criticism; though there is probably no person living better acquainted with the peculiarities of this MS. than Mr. I. Bywater, of Exeter College, Oxford, to whose kindness I owe several important collations, besides which I have also some made by myself.

But a second kind of criticism has of late become very prominent in the field of Platonic study, and its necessity seems to be pretty generally acknowledged, in spite of the vehement war waged against it by many English scholars, and especially by Stallbaum; I mean *conjectural* criticism. Heindorf's ingenious conjectures, though published before Bekker's edition, still deserve careful consideration; occasionally we may learn something from Hirschig, though in most instances we regret the absence of critical σωφροσύνη from his pages; very rarely Cobet will furnish us a good observation or emendation, owing to the sovereign and arbitrary manner in which he corrects Plato, just if he were a mere schoolboy whose knowledge of Greek style was far inferior to Cobet's;—how very different from the late J. Riddell, whose *Digest of Platonic Idioms* shows such conscientious study of the language and style of his author—but it is *Dr. Badham*, who, more than any one else, has shown the necessity of employing conjectural criticism in Plato. Prof. Vermehren fully acknowledges the importance of Badham's "numerous, partly highly felicitous and ingenious emendations," but regrets their being put forth with such "laconic brevity." It is true, he frequently disagrees with Badham, but that is only natural; if we might venture to say a word on the point, we think that in his last two publications on Plato—ingenious and important as they are—Dr. Badham has scarcely done himself justice, a certain hurry appearing almost everywhere, and many hints and thoughts being only just thrown out which would have been capable of further elaboration, and which it was, moreover, the editor's duty to work out completely. Prof. Vermehren gives, on p. 8, a remarkable instance of this, by himself explaining and arguing for an emendation of Badham's.

Among Prof. Vermehren's observations there are some with which we agree, some with which we disagree, and some which we think scarcely justifiable.

We agree, above all, with his tendency rather to emend a passage than throw out a number of words as an interpolation, *e.g.* Sympos. 181 C, 182 D (though here we confess not to be quite convinced), and 186 E, while *ib.* 186 A we believe to be interpolated notwithstanding our writer. We are, moreover, inclined to accept ἐπάθουν ἕκαστοι, *ib.* 191 A, and consider the conjectures on 202 E and 205 D very

ingenious, though scarcely convincing; but protest against such violent changes as 179 B, where τούτου is changed to δοκεῖ! or 180 E, where πάντας θεούς is turned into πάντα γ' ὁμοίως. In the passage from the Sympos. p. 178 E, treated p. 46, we would add οὐκ after ὅπως, taking ἄμεινον in the sense of "excellently" without any comparative meaning, and translating ἤ by "or" (not "than"), but agree with Vermehren in considering the stop after ἀλλήλους absurd, as the three participles ἀπεχόμενοι . . καὶ φιλοτιμούμενοι . . καὶ μαχόμενοι conjointly describe the causes of the victory obtained by the πόλις ἐραστῶν τε καὶ παιδικῶν. In another passage, 175 B, we think that Vermehren's conj. τίσις μὴ ἐφεστήκοι is altogether foreign to Plato's mode of expression; the passage is, however, very difficult, and perhaps ἐπειδάν τις may be ἐπεὶ δεσπότης, or also ἐπειδὴ αὐτὸς (="master").

In some passages the reading seems to be perfectly sound in spite of Vermehren's doubts. Laches, 186 E, *e.g.*, is either right as it stands, or the simple addition of ἤ before καὶ πότερα would obviate all difficulties. In Symp. 176 A the words ἃ—ἐποίει form an integral part of Apollodorus' speech, and according to Greek idiom must be in the imperfect tense; in 178 C the position of ἤ goes against Vermehren's explanation. In another passage (Sympos. 172 A) I am surprised to find so much sagacity and learning wasted, if but for the consideration that it is nowhere proved that ἀπολλόδωρος can have the sense of ἔρμαιον; the joke simply consists in the pompous appellation Παληρεὺς οὗτος Ἀπολλόδωρε, where the mere mention of the name would have been sufficient: comp. the drunken Philip's pompous and ironical Δημοσθένης Δημοσθένους Παιανιεὺς τάδ' εἶπεν.

But even these cursory observations will suffice to show that a perusal of this volume will amply reward the attentive reader of Plato. It should not be neglected by any future editor.

W. WAGNER.

SANSKRIT MANUSCRIPTS IN BENGAL.

IT will be in the recollection of our readers that, at the instance of Mr. Whitley Stokes, the Indian Government has sanctioned an annual outlay of 24,000 rs. (including a grant of 3000 rs. to the Asiatic Society of Bengal) for the printing of lists of MSS. in the Indian libraries, and the purchase of unique or unusually valuable ones. The task of collecting and examining lists of MSS. in Bengal was entrusted to Bâbû Râjendralâla Mitra, who has just issued a catalogue of Sanskrit MSS. with an account of the method employed by him in his operations.* This work contains descriptions of rather more than 200 MSS., in the order in which they were brought under the editor's notice. As, however, similar lists will be published from time to time, "it is intended to supply a classified index on the completion of a volume." A different method has been employed in the *Classified Alphabetical Catalogue of Sanskrit MS. in the Southern Division of the Bombay Presidency* published at Bombay. In this catalogue we are furnished with a scientific arrangement, which does not, however, give any information beyond the title of the work, the name of the author, the number of leaves in the MS., and the average number of lines in a page, the place where it is deposited, and whatever dates may be found in it regarding its transcription. Bâbû Râjendra, on the other hand, in the work referred to above, accompanies the title of each work with a short abstract of its contents in English, with occasional references to books in which further details may be found; then he gives the title in Devanâgarî, the name of the author, and the necessary information on the nature of the MS., and in conclusion the opening and concluding sentence or couplet. The chief advantage of this method is that it enables us to identify the work noticed in the catalogue, whenever we may happen to light on another copy of the same work, even should it be deficient in either the beginning or the end, or, as often happens, in the colophon containing the title and the author's name. By far the greater part of the MSS. in the catalogue now under notice are copies of modern dramas and poems and Upanishads, many of which, though hitherto unknown, are apparently of quite recent origin and hardly deserving that denomination. Still there are copies of Upanishads among them, and not a few, which will be useful, the more so as several of them are accompanied by commentaries.

In grammatical, phonetical, and Prâtiśâkhya-literature, I may notice a "complete and remarkably correct" copy of the *Mahâbhâshya*, a "remarkly correct and beautifully written" copy of the *Tribhâshyaratna*, or commentary on the *Taittirîya-Prâtiśâkhya*, the *Nâradîyaśikshâ* with a commentary by *Śobhâkara*, the *Lomaśiśikshâ* by Gargâchârya, the *Amoghânandinî-*, *Kauśikî-* and *Maṇḍûka-śikshâs*. Of Kalpa-works there is Śankha's *Gṛihyasmṛiti* with a commentary, the *Śânkhâyana Gṛihyasûtra*, the *Drâhyâyaṇasûtra-Ṭîkâ* ("pariśuddham") by Dhanvisvâmin, two copies of the *Subodhinî*, a commentary on the *Baudhâyanasûtras* and a few others. In medicine: Bhâva Miśra's *Bhâvaprakâśa* and several others.

In a compilation of this kind we must be prepared to meet with errors, and particularly with misreadings, in excerpts from manuscripts. The remarks in English also do not seem to have had the benefit of a careful corrector whilst passing through the press, as they bristle with misprints. With several of the works noticed some doubt may be entertained as to the nature of contents assigned to them by the compiler. The *Saptaśatî* by *Govardhana Âchârya*, for instance, noticed under No. lxxvii., is stated to be a work "on moral maxims," consisting of 700 ślokas. The work is, however, in the first place a vocabulary (and as such it is mentioned by Medinîkara), from which Wilson supposed the plan of the Hindi vocabulary *Sat Sai* by Bahârilâl to have been conceived. I may add that among Colebrooke's MSS. at the India Office Library there is a copy of Govardhana's *Kośa* (with a commentary by Ananta Pandita, MS. 959), the first and last ślokas of which, with some variations, agree with those given in Bâbû Râjendralâl's catalogue. The text was also published at Calcutta in 1864. Notwithstanding these shortcomings, the method adopted in this catalogue is very useful, and will, it is to be hoped, be followed in other parts of India. The second number of Bâbû Râjendrâl's catalogue will, I understand, reach Europe shortly.

J. EGGELING.

* *Notices of Sanskrit MSS.*, by Râjendralâla Mitra. Published under orders of he Government of Bengal. No. I. Calcutta, 1870. 8vo. pp. v. 109.

TO THE EDITOR OF *THE ACADEMY.*

SIR,—In his review of the new edition of Corssen's *Aussprache, Vokalismus und Betonung der lateinischen Sprache* (*Academy*, vol. ii. p. 82), Mr. Nettleship calls attention to the fact that Corssen has proved the genitives in *ais* and *aes* not to be genuine Latin forms, and that therefore the derivation of genitives in *âî* and *ae* from those in *ais* and *aes* is no longer tenable. "It is not, therefore, surprising," he adds, "that Corssen should return to the view that the genitive in *ai* is properly a locative."

It so happens, however, that in his second volume, p. 721, Corssen retracts this admission, and claims genitives in *âî* again as corruptions of older genitives ending in *s*. He supposes that, corresponding to the Sanskrit genitive in *âyâs*, there was a Latin genitive in *â-ias*, changed to *â-ia*, *â-ie*, and *â-î*. His reasons for changing his opinion are that no decided locative in *âî* occurs in literary monuments, and that the genitive of the fifth declension in *êî* never has the power of the locative. The first reason has little weight, considering the comparative scantiness of genitives in *âî*; the second is invalidated by Corssen's own remark, that nearly all nouns of the fifth declension are abstract nouns, and therefore not likely to occur in the locative. But there is even a stronger reason why genitives in *âî* and *ae* should be taken as original locatives, and not as corruptions of genitives, real or imaginary, ending in *s*; viz. *that* (if we except a few doubtful cases, like *diu*, &c.) *no final* s *is dropt in Latin after an organically long vowel.* In the course of a sentence, no doubt, any final *s* may become evanescent, but the loss of a final *s* after a long vowel in a grammatical termination is, I believe, without a precedent. The nom. plur. of *o*-stems in *oe*, *ei*, *î* cannot be derived, as has been supposed, from the nom. plur. in *es*, *eis*, *îs* by dropping the *s*, first, because the former are really the older forms; secondly, because there would be no excuse for dropping the *s*. Corssen explains nom. plur. such as *magistrî* for *magistrîs* by admitting a secondary base *magistrî*, like *acro* and *acrî* (p. 756). This is better than taking *is* as a contraction of an original *a* and *as* (cf. *pûrvâs pûrve*), which in Latin would be phonetically objectionable.

MAX MÜLLER.

TO THE EDITOR OF *THE ACADEMY.*

SIR,—I regret to find that there is very little literary work going on in India just now.

Major W. M. Carr has just taken up the study of the Dakhnî, or southern dialect of Hindustânî, and proposes to edit, with notes, some of the chief works. He has also in the press an edition of Nannaya Bhaṭṭa's Ândhra-çabda-cintâmaṇi. This is supposed to be the oldest Telugu grammar in existence, and consists of 278 Sûtras in Sanskrit. The author has made use of the technical terms of Pânini and the Çivasûtras, but has added a few new ones, e. g., *druta* for n used to obviate hiatus. He is also the author of the classification of words used in Telugu, according to the fancied derivation (P. I. 46), namely, *tatsama*, or words taken unaltered from Sanskrit; *tadbhava*, or modified Sanskrit words; *deçya*, or pure Telugu words; and *grâmya*, vulgar or foreign words. It may have been a step in advance when Nannaya wrote, but

this classification has long hindered true progress in Dravidian Comparative Philology. The age of Nannaya is not certain; he probably lived under the later Cālukyas, and about the 10th cent. A.D. His work has been repeatedly commented on; but Major Carr will give an English translation.

In Tibetan Dr. Jaeschke has printed a version of the Epistles of John. At the end are 44 pages in German containing critical remarks, which add much to our knowledge of Tibetan grammar and lexicography.

I am myself at work at an essay on Strīdhana, in which I attempt to illustrate a very obscure question of Hindu Law by the historical method, which is as yet entirely neglected by writers on this subject. I am also to examine for the Government the Sanskrit MSS. in the Mysore Rājā's Library. A. Burnell.

Cuddapah, Madras Presidency, Dec. 12, 1870.

Contents of the Journals.

Philologus, vol. xxx. pt. 5.—Beiträge zur Erklärung Homers. I. Die Spuren der Bronzezeit. II. Das Haus des Odysseus. (Mit zwei Tafeln.) By L. Gerlach. [Two most interesting antiquarian essays. The first takes for text the line (Iliad, xviii. 401, *πόρπας τε γναμπτάς θ' ἕλικας κάλυκάς τε καὶ ὅρμους*) enumerating the ornaments which Hephaestus wrought in his sea-cave. Homer belongs to the beginning of the Iron Age, but shows a fresh recollection of the earlier time: and this line, occurring in a very primitive piece of mythology, gives us the names of several ornaments not elsewhere mentioned. Dr. Gerlach shows that these names answer very well to articles of the Bronze Age, which have been found in Northern Europe, especially in Schwerin and Strelitz, and that this coincidence is part of a general agreement between the remains of the same period in Greece, Italy, and Germany. The funeral customs, in particular, correspond in the most striking way, even down to the use of oak in the pyre. The prevailing character of the ornaments in question is the fondness for spiral lines. Thus the *ἕλιξ* is a ringlet-shaped elastic (*γναμπάς*) ornament, of which specimens are found both of bronze and of gold. The *ὅρμος* is a plaited collar. The *κάλυξ* is like the "cup" of a flower. Another design is the *ἀνθέμιον*, a combination of the figure of a flower, with a flat spiral like an Ionic volute. The second essay relates to the history of architecture, showing how the house or palace of the Heroic Age grew out of the primitive wooden hut, and again how it was transformed, without any essential change in construction, internal disposition, or ornament, into the Greek temple of historical times. For the interpretation of the Odyssey—in particular for the solution of the various difficulties surrounding the words *μεσόδμη, ὀρσοθύρη, ὀπαῖα*, &c.—this part of Dr. Gerlach's paper is of the greatest importance.]—Ueber die Amazonen in den Sagen der kleinasiatischen Städte, by O. Klügmann. [It appears, from the careful account given, that the Amazons are not closely connected with any of the great religious worships of Asia Minor. At Ephesus, for instance, they were only said to have fled as suppliants to the protection of the "great goddess" of that place. Many places are said to have been called from them; and they were especially associated, as in so many similar cases, with supposed funeral mounds, but they were nowhere venerated as the founders of cities. Most of the geographical names popularly derived from Amazons—*Μύρινα, Μύρρα, Σμύρνα*, &c.—show the desire of connecting local traditions with the well-known lines in which Homer (Il. ii. 811) speaks of the hill "which men call Batieia but immortals the tomb of far-bounding Myrine." H. Klügmann thinks that the invasions of northern tribes, such as the Kimmerians, with the masculine character of their women, left this impression on the imagination of the people of Asia Minor. The prominence of the Amazons in the adventures of Theseus, Hêraklês, &c., seems to point rather to a more purely mythical origin. The passage of Homer deserves further consideration. It means, as Lobeck showed, that the hill Batieia was in fact so called by men, but in reality was the tomb of Myrine. The myth, therefore, was only half localised. This gives the more value to H. Klügmann's proof of the dependence of other local Amazon legends on this passage. The Homeric text seems to have exercised a determining influence on the whole class of legends.]—G. Roeper: On Diogenes Laertius I. [Corrects sundry places in Bk. I.: the result, in the case of the proper names at least, is hardly more satisfactory than that of many similar attempts.]—A. O. F. Lorenz: Contributions to the Criticism and Exegesis of the Miles Gloriosus of Plautus. [An appendix to his well-known edition: gives some valuable particulars about the MSS. B and D, and in the discussion of isolated passages introduces a variety of matter of general interest, *e.g.* remarks on *unus* as an article, on the meaning of *facetus*, &c.]—H. F. Zeyss: Explanations of Passages in Latin Authors [Cic. de Orat., Sallust, Livy].—E. von Leutsch: On Verg. Ecl. x. 1, and x. 9-22.

Philol. Anz. vol. ii. part 2.—Homers Ilias, für den Schulgebrauch erklärt von J. La Roche. Th. I. II. Gesang i.-viii. Rev. by L. G. [Generally laudatory: finds fault chiefly in reference to antiquarian points.]—H. Lehmann: Zur Lehre vom Locativ bei Homer.—W. Jungclaussen: Ueber das Greisenalter bei Homer. [Suggested by Ameis on Od. xv. 246.]—Codicis Scholiorum Sophocl. Dobkowiciani coll. a L. Lange confectae specimen V.—Ueber Umarbeitung einiger Aristophanischen Komoedien, von Joseph Stanger. Rev. by E. von Leutsch. [Unsuccessful attempt of a young student.]—M. Haupt: De Halladiis Besantinos et Alexandrino. Rev. by G. Roefer.—W. Hahn: Zur Entstehungsgeschichte der Scholien des Donat zum Terenz. [Useful.]—Lehrbuch der griechischen Privatalterthümer, von K. F. Hermann. 2. Aufl. bearbeitet von Karl Bernhard Stark. Rev. by G. Wolff. [Makes some additional notes.]—Besitz und Erwerb im griechischen Alterthume, von B. Büchsenschütz. Rev. by H. Frohberger. [Important and comprehensive work.]—Wörterbuch zu Dr. Martin Luther's deutschen Schriften, von. Ph. Dietz. 1. Bd. (A–F) [Laudatory.]

Selected Articles.

On the Significance of the Stone of Mesha, by Dr. Himpel, in Merx. Archiv., vol. ii. part 1. [A good summary of linguistic and palæographical results.]

The Rise of Islam, by Michele Amari, in the Nuova Antologia, Dec. [Defends the comparative credibility of the oral tradition, and gently corrects Springer for his excessive scepticism. An interesting account is given of the vicissitudes of the story of Mohammed in Europe, and an acute criticism of the lives of the prophet by Sprenger, Muir, and Syed Ahmed, the first of whom is biassed by his partiality for medical studies, the second by "too much Christian logic," the third by his uncritical Oriental education. In conclusion, Sig. Amari announces his intention, alas! unexecuted, to publish a recast Italian version of his essay on the chronology of the Koran, which was crowned by the French Academy.]

Studies in Rabbinic Etymology, by J. Perles, conclusion, in Grätz's Monatsschrift, Dec.

Benfey on the Sanskrit *r*-suffixes, noticed in Lit. Centralblatt, Dec. 10, and Radloff's Specimens of the Kirgis dialects, in the same, Dec. 17.

THE ACADEMY.

"Inter silvas Academi quærere verum."

Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance.
The Editor of The Academy *cannot undertake to return communications which are not asked for.*
The next number will be published on Wednesday, February 15th, and advertisements should be sent in by February 9th.

NOTICE.

The Academy *will in future appear regularly on the 1st and 15th of every month.*
The space devoted to Theology, Science *and* Philosophy, History, *and the various branches of* Philology, *in each month will be the same as before: whilst the department of* General Literature *has been increased to more than twice its original size, and is in course of complete reorganization.*

General Literature.

Madeline, with other Poems and Parables. By Thomas Gordon Hake, M.D. London: Chapman and Hall, 1871.

Above all ideal personalities with which the poet must learn to identify himself, there is one supremely real which is the most imperative of all; namely, that of his reader. And the practical watchfulness needed for such assimilation is as much a gift and instinct as is the creative grasp of alien character. It is a spiritual contact hardly conscious yet ever renewed, and which must be a part of the very act of production. Among the greatest English singers of the past, perhaps four only have possessed this assimilative power in pure perfection. These are Chaucer, Shakespeare, Byron, and Burns; and to their names the world may probably add in the future that of William Morris.

We have no thought of saying that not to belong to this circle, widest in range and narrowest in numbers, is to be but half a poet. It is with the poetic glory as with the planetary ones; this too has satellites called into being by the law of its own creation. Not every soul specially attuned to song is itself a singer; but the productive and the receptive poetic mind are members of one constellation; and it may be safely asserted that to take rank in the exceptional order of those born with perfect though passive song-perception is to be even further removed from the "general reader" on the one hand than from the producer of poetry on the other.

But some degree, entire or restricted, of relation to the outer audience, must be the test of every poet's vocation, and has to be considered first of all in criticising his work. The book under notice has perhaps as limited a reach of appeal as can well be imagined, and the writer's faculty of *rapport* seems on the whole imperfect; yet there are qualities in what he has written which no true poetic reader can regard with indifference.

The best and most sympathetic part of Dr. Hake's volume is decidedly its central division — the one headed "Parables." Had one poem of this section, quaintly called "Old Souls," come first in the book, the favourable impression on opening it must have been immediate and conclusive. The poem is a symbolic expression of the humility of Christ in his personal ministering to man's needs and renewal of fallen humanity; and the subject is carried out with great completeness as regards the contrast between Christ himself and his earthly representatives, his relation to all classes of men, and the deliberate simplicity of his beneficent labour in the soul. The form of expression adopted in this poem is of the highest order of homely pathos, to which no common word comes amiss, and yet in which the sense of reverence and appropriateness is everywhere perfect. The piece is so high in theme, and so utterly good of its class, that we shall not attempt to extract from it, as its unity of purpose and execution throughout is the leading quality without which no idea of its merit can be conveyed.

Two others among the four "Parables"—"The Lily of the Valley" and "The Deadly Nightshade"—though somewhat less perfect successes than this, rival it in essential value. They are contrasted pictures; the first, of poverty surrounded by natural influences and the compensations of universal endowment; the other, of poverty surrounded in the life of cities by social rejection only, and endlessly instigated to snatch some share of good by the reiterated scoff, "This is not for thee." In the first poem a young forest-bred girl, in the second a boy reared in the fetid life of courts and alleys, is the medium through which the lesson is developed. Here, again, we are at some loss to express the poems by extract; but with this proviso we may take from the "Lily of the Valley" a few sweet stanzas of simple description:—

"The wood is what it was of old,
A timber-farm where wild flowers grow:
There woodman's axe is never cold,
And lays the oaks and beeches low:
But though the hand of man deface,
The lily ever grows in grace.

"Of their sweet loving natures proud,
The stock-doves sojourn in the tree:
With breasts of feathered sky and cloud,
And notes of soft though tuneless glee,
Hid in the leaves they take a spring,
And crush the stillness with their wing.

"The wood to her was the old wood,
The same as in her father's time;
Nor with their sooths and sayings good
The dead told of its youth or prime.
The hollow trunks were hollow then,
And honoured like the bones of men."

This simple story or parable has great beauties, especially at the point where the first acquaintance with death among those she loved causes the child to wander forth bewildered, and at last, weary and asleep in the wood, to find the images of terror and decay hitherto overlooked in nature assume prominence for the first time in her dreams. This is very subtle and lovely; but it must be added that even this poem, which is among the least difficult in the book, needs some re-reading before it is mastered, and leaves an impression—if not of artificiality, to which the author's mind is evidently superior—yet of a singular native tendency to embody all conceptions through a remote and reticent medium. This, however, is much less apparent in the "Deadly Nightshade," which approaches "Old Souls" in clearness and mastery, though not essentially finer than its companion poem, the "Lily." The description here of the poor beggar-boy's drunken mother is in a vein of true realistic tragedy; and the dire directness of treatment is carried on throughout:—

"Then did he long for once to taste
The reeking viands, as their smell
From cellar-gratings ran to waste
In gusts that sicken and repel.
Like Beauty with a rose regaled,
The grateful vapours he inhaled.

"So oft a-hungered has he stood
And yarn of fasting fancy spun,
As wistfully he watched the food
With one foot out away to run,
Lest questioned be his only right
To revel in the goodly sight.

"Lest justice should detect within
A blot no human eye could see,
He dragged his rags about his skin
To hide from view his pedigree:
He deemed himself a thief by law,
Who stole ere yet the light he saw.

"His theft, the infancy of crime,
Was but a sombre glance to steal,
While outside shops he spent his time
In vain imaginings to deal,
With looks of awe to speculate
On all things good, while others ate.

"No better school his eyes to guide,
He lingers by some savoury mass,
And watches mouths that open wide
And sees them eating through the glass:
Oft his own lips he opes and shuts,—
With sympathy his fancy gluts.

"Yet he begs not, but in a trance
Admires the scene where numbers throng;
And if on him descends a glance,
He is abashed and slinks along;
Nor cares he more, the spell once broke,
Scenes of false plenty to invoke."

The fourth "Parable," called "Immortality," deals with the course of an elevated soul in which thwarted ambition is tempered by resignation, and which looks into the future of eternity for free scope and for a reversed relation between itself and antagonistic natures. This, however, is somewhat obscurely rendered, and must be pronounced inferior to the other three. Of these three, we may say that, if they are read first in the book, the fit reader cannot but be deeply moved by their genuine human and spiritual sympathy, and by their many beauties of expression; and will be prepared to look thenceforward past his author's difficulties to the spirit which shines through them, with a feeling of enthusiastic confidence.

We may turn next to the last section of the volume—the series of sixty-five short poems entitled in the aggregate "The World's Epitaph." Many of these reveal the same tender thought for human suffering which is the great charm of the "Parables," and it is sometimes expressed with equal force and beauty. Such pre-eminently are those "On the Outcast" and "On the Saint;" the last conveying a picture which has something startlingly imaginative, of a member of the communion of saints presenting before the supreme Tribunal, as an appeal for pity, some poignant personation of the anguish endured on earth. However, here again the order of the poems seems unfortunate, the series opening with some of the weakest. Many of the "epitaphs" have appended to them an "epode" which appears to be, generally or always, the rejoinder of the world to the poet's reflection; but perhaps these do not often add much to the force of the thing said. Such a scheme as this series presents is obviously not to be fairly discussed in a brief notice like the present; but we may note as interesting examples, in various degrees, of its plan, the epitaphs "On the Sanctuary," "On Time," "On the Soul," "On the Valley of the Shadow," "On Life," "On the Seasons of Life," "On the Widow," "On Early Death," "On the Deserted," "On Dissipated Youth," "On the Statesman," "On Old Age," "On Penitence," and "On the Struggle for Immortality." As a specimen of this section of the book we extract the following brief poem "On the Soul:"—

"Free as the soul, the spire ascends;
Heaven lets it in her presence sit;
Yet ever back to earth it tends,—
The tranquil waters echo it.
So falls the future to the past;
So the high soul to earth is cast.

"But though the soul thus nobly fails,
Not long it borders on despair;
It still the fallen glory hails,
Though lost its conquests in the air.
While truth is yet above, its good
Is measured in the spirits' flood.

"Though not at first, its holy light
Is figured in that mirror's face,
It scarce returns a form less bright
Than fills above a higher place.
The one was loved though little known,
The other is the spirit's own."

This little piece, in spite of some uncertainty in the arrangement of its last stanza, has the dignity and ordered compass of a mind naturally empowered to deal with high things; and this is often equally evident throughout the series. Still we have to regret that even complete obscurity is a not uncommon blemish, while imperfect expression seems too often to be attributable to a neglect of means; and this despite the fact that a sense of style is certainly one of the first impressions derived from Dr. Hake's writings. But we fear that a too great and probably organic abstraction of mind interferes continually with the projection of his thoughts; and we are frequently surprised to meet, amid the excellence and fluent melody of his rhythm, with some sudden deviation from the structure of the metre employed, which can be attributable only to carelessness and want of watchful revision. It needs such practical and patent proofs as this to convince one of neglect where the instinct of structure exists so unmistakably; and it is then that we begin to perceive the cause of much that is imperfect in the author's intellectual self-expression. This is no doubt the absence of that self-examination and self-confronting with the reader which are in an absolutely unwearied degree necessary in art; and the question only remains whether the poet's nature will or will not for the future admit of his applying at all times a rigorous remedy to this mental shortcoming.

The same difficulty meets us in excess when we come to the poem which stands first on Dr. Hake's title-page—"Madeline." With this our remaining space is far from permitting us to deal at such length as could alone give any true idea of its involved and somewhat bewildering elements. Its unexplained form is a puzzle at the outset. It is delivered in a kind of alternating recitative between "Valclusa," the name of the personified district in which the action is laid, and a "Chorus of Nymphs." The argument may be summed up somewhat to this effect. Hermes, a beneficent magician and poet, has been enamoured of Daphne, who has since died and become to him a ministering spirit and his coadjutress in the hallowed exercise of his art. He has been made aware of the seduction of a young girl, Madeline, by the lord of the land, and has in vain laboured to prevent it, but now calls Daphne to his aid in consoling the outcast. This angelic spirit conveys her to the magician's home, where a sort of heavenly encampment is formed, in the midst of which Madeline lies in magic slumbers watched by her protectress. Glad and sad visions succeed each other in her sleep, varied but not broken by conference with Daphne, who urges her to forgiveness of her betrayer. But she has been chosen by a resistless power as the avenger of her own wrong; and as this ever-recurring phantom of vengeance gains gradual possession of her whole being, the angelic comforter, who has taken on herself some expiatory communion in Madeline's agony, is so wrung by the human anguish that she undergoes the last pain of humanity in a simulated death. Madeline then fulfils her destiny, and makes her way, still in a trance of sleep, by stormy mountain passes to the castle of him who had wrought her ruin; passes through his guards, finds him among his friends, and slays him. She then returns to the magic encampment, and lying down by the now unconscious Daphne, is in her turn

released by death. The poem closes with the joint apotheosis of the consoler and the consoled, together with a child, the unborn fruit of Madeline's wrong.

This conception, singular enough, but neither devoid of sublimity nor of real relation to human passion and pity, is carried out with great structural labour, and forms no doubt the portion of the volume on which Dr. Hake has bestowed his most conscientious care. But our rough argument can give no idea of the baffling involutions of its treatment and diction, rendering it, we fear, quite inaccessible to most readers. The scheme of this strange poem is as literal and deliberate in a certain sense as though the story were the simplest in the world; and so far it might be supposed to fulfil one of the truest laws of the supernatural in art—that of homely externals developing by silent contrast the inner soul of the subject. But here, in fact, the outer world does not once affect us in tangible form. The effect produced is operatic or even ballet-like as regards mechanical environment and course of action. This is still capable of defence on very peculiar ideal grounds; but we fear the reader will find the sequence of the whole work much more difficult to pursue than our summary may promise.

The structure of the verse is even exceptionally grand and well combined; but the use of language, though often extremely happy, is also too frequently vague to excess; and the employment of one elaborate lyrical metre throughout a long dramatic action, only varied by occasional passages in the heroic couplet, conveys a certain sense of oppression, in spite of the often felicitous workmanship. Moreover a rigid exactness in the rhymes—without the variation of assonance so valuable or even invaluable in poetry—is apt here to be preserved at the expense of meaning and spontaneity. Nevertheless, when all is said, there can be no doubt that the same reader who at one moment lays down a poem like this in hopeless bewilderment might at another, when his mind is lighter and clearer, and he is at a happier juncture of *rapport* with its author, take it up to much more luminous and pleasurable results, and find it really impressive. One point which should not be overlooked in reading it is, that there is an evident intention on Dr. Hake's part to make hysterical and even mesmeric phenomena in some degree the groundwork of his conception. The fitness of these for poetry, particularly when thus minutely dealt with, may indeed afford matter for argument, but the intention must not be lost sight of. Lastly, to deny to "Madeline" a decided element of ideal beauty, however unusually presented, would be to demonstrate entire unfitness for judgment on the work.

We have left ourselves no room to extract from "Madeline" in any representative way; but the following two stanzas (the second of them extremely fine) may serve to give an idea of the metre in which it is written, and afford some glimpse of its uniquely fantastic elaboration. The passage is from the very heart of the poem; where Madeline is overshadowed in sleep by the vision of her seducer's castle, rousing half-formed horror and resolve; till all things, even to the drapery which clothes her body, seem to take part in the direful overmastering hour.

"The robe that round her flows
Is stirred like drifted snows;
Its restless waves her marble figure drape
And all its charms express,
In ever-changing shape,
To zephyrs that caress
Her limbs, and lay them bare,
And all their grace and loveliness declare.
Nor modesty itself could chide
The soft enchanters as they past her breathe
And beauty wreathe
In rippling forms that ever onward glide.

"Breezes from yonder tower,
Loosed by the avenging power,
Her senses hurry and a dread impart.
In terror she beholds
Her fluttering raiment start
In ribbed and bristled folds.
Its texture close and fine
With broidery sweeps the bosom's heaving line,
Then trickles down as from a wound,
Curdling across the heart as past it steals,
Where it congeals
In horrid clots her quivering waist around."

We have purposely avoided hitherto any detailed allusion to what appear to us grave verbal defects of style in these poems; nor shall we cite such instances at all, as things of this kind, detached from their context, produce often an exaggeratedly objectionable impression. Suffice it to say that, for a writer who displays an undoubted command over true dignity of language, Dr. Hake permits himself at times the most extraordinarily conventional (or once conventional) use of Della-Cruscan phrases, that could be found in any poet since the wonderful days when Hayley wrote the "Triumphs of Temper." And this leads us to a few final words on his position as a living writer.

It appears to us then that Dr. Hake is, in relation to his own time, as original a poet as one can well conceive possible. He is uninfluenced by any styles or mannerisms of the day to so absolute a degree as to tempt one to believe that the latest English singer he may have even heard of is Wordsworth; while in some respects his ideas and points of view are newer than the newest in vogue; and the external affinity frequently traceable to elder poets only throws this essential independence into startling and at times almost whimsical relief. His style, at its most characteristic pitch, is a combination of extreme homeliness, as of Quarles or Bunyan, with a formality and even occasional courtliness of diction which recall Pope himself in his most artificial flights; while one is frequently reminded of Gray by sustained vigour of declamation. This is leaving out of the question the direct reference to classical models which is perhaps in reality the chief source of what this poet has in common with the 18th century writers. The resemblance sometimes apparent to Wordsworth may be more on the surface than the influences named above; while one might often suppose that the spiritual tenderness of Blake had found in our author a worthy disciple, did not one think it most probable that Blake lay out of his path of study. With all his peculiarities, and all the obstacles which really stand between him and the reading public, he will not fail to be welcomed by certain readers for his manly human heart, and genuine if not fully subjugated powers of hand.

D. G. Rossetti.

The Mutineers of the Bounty, and their Descendants in Pitcairn and Norfolk Islands. By Lady Belcher. With Illustrations. London: John Murray, 1870.

The appearance of a new history of the mutineers of the *Bounty* is justified by the fact that Lady Belcher has obtained much additional information from original sources, which to a great extent supplies the deficiencies of preceding narratives as to the causes which led to the mutiny, and also brings down the history of the Pitcairn Islanders to the middle of the year 1869. The most valuable portion of the new matter consists of the journal of one of the petty-officers, James Morrison, who, though not a mutineer, was kept on board the ship, and was subsequently taken home prisoner in the *Pandora*. This journal bears internal evidence of being a truthful narrative, and of being written by a person by no means prejudiced against the captain; yet it reveals such an amount of spite and petty tyranny on the part of

Bligh against the officers and crew, but more especially against the chief officer, Christian, a gentleman by birth and education, that not only is the mutiny itself fully accounted for, but it is also, from an unofficial point of view, almost justified. The account of the sufferings of the prisoners, who after waiting two years at Tahiti, voluntarily delivered themselves up to the captain of the *Pandora*, is now for the first time fully given from the same source; and when we remember that these prisoners were all untried, and most of them quite innocent men, the reckless barbarity with which they were treated is almost incredible. That it appears so to us now, although it passed almost unnoticed at the time, may be taken as a gratifying proof of how much, within the memory of persons now living, society has advanced in that true civilisation which is indicated by a horror of all injustice, tyranny, and needless cruelty.

But it is to the subsequent career of the mutineers and their descendants—the well-known Pitcairn Islanders—that we are most attracted, presenting as it does features of the highest social and political interest. It is so rarely that social problems can be subjected to anything like a critical experiment, owing to the impossibility of eliminating the disturbing influence of adjacent populations, that we should have thought our rulers would have carefully secured this one from interruption. In Pitcairn Island we had an instance of people almost completely isolated from the rest of the world, who, owing to such exceptional circumstances as can hardly be expected to occur a second time, were morally and physically healthy, with most of the capacities and virtues, and but few of the vices of civilisation; and who were both able and willing to keep themselves free from intermixture or social contamination. Many curious problems were here in process of solution. The little community consisted almost entirely of half-breeds; would any signs of sterility appear, or could they permanently continue the race? They necessarily soon came to marry almost wholly with blood-relations; would this cause disease or deterioration? In the mixed race would the characteristics of the white or of the brown progenitors ultimately prevail, and which special features of each would maintain themselves longest? As population increased, would zymotic diseases arise? Was infant mortality above or below the average of civilised communities? Would the services of a regular medical man increase or diminish the mortality? The political and social problems were of equal interest. The islanders began with a simple republican form of government; would they maintain this? They began dividing the land equally among each man's descendants of both sexes, a certain portion falling due on their marriage; how long would this practice continue? When population so increased as to render the means of subsistence difficult, would they put a stop to early marriages, and with what result? Would they establish a poor law or trust to private benevolence? In an intelligent, industrious, and healthy population, what numbers could be supported by each acre of cultivable ground? Would the prohibition of alcoholic drinks in the island be permanently maintained? These are a few of the questions we might have had answered had Pitcairn Island been let alone, or had the people been removed to some larger island equally remote from civilisation and equally difficult of access. Unfortunately, however, before there was any pressing necessity for removal at all, ar trongly against the inclinations of the majority of the inhabitants, they were persuaded to allow themselves to be removed in a body to Norfolk Island, which they understood was to be wholly given up to them in order that they might have ample room for their rapidly increasing numbers. Yet hardly have they settled there when a thousand acres of land is taken to found a missionary college for Melanesian converts, notwithstanding the protests of the Pitcairners. They soon find that the island is not their own as Pitcairn was. They are now under the New South Wales government, and though they have been as yet left under their own freely elected magistrate, there is nothing to prevent a governor with different views from dictating to them and putting strange officers over them. This unexpected change from their former freedom disgusted several families, who, as soon as they could obtain the means, returned to their old home. At Norfolk Island they are far less isolated than before. Trading vessels and whalers often visit them. Strangers settle among them or marry and carry away their girls. They have no longer the accustomed resources of bread-fruit, cocoa-nuts, and bananas for food, or *tappa* for clothing, and many have turned whalers or get their living by trade. The rural self-supporting simplicity of their former state is gone; yet by the latest accounts they still retain that kindliness of disposition and purity of life, which so charmed every visitor to Pitcairn Island.

Their numbers are now somewhat more than 300 in Norfolk Island; and allowing for those who have left, we find that since 1800 their little population has about doubled itself every twenty years. Though they had only an amateur doctor in their schoolmaster, Mr. Nobbs, the mortality among them was very slight. In the ten years from 1841 to 1850, for example, there were 62 births and only 13 deaths, at which time the population was 156. The numbers of the sexes were always nearly equal, sometimes the male and sometimes the female element preponderating; and when they had reached a population of 300, there were exactly 150 of each sex. These figures would indicate that both the death and birth rates were low, the former extraordinarily so; and as all marry very young, and almost every form of vice and immorality is unknown, they should be one of the happiest, as they are one of the most interesting, of English-speaking communities.

In the Pitcairn code of laws (as given in the Rev. T. B. Murray's volume on "Pitcairn") we find several excellent regulations which might advantageously be copied by other communities. The laws were to be made known by being read in public; all parents were obliged to send their children to school, having previously taught them the alphabet; no intoxicating liquors were to be made or introduced, except for medicine; no law was made in anticipation of crimes; all punishments were by fines, unless otherwise determined by the jury; and women had votes for the election of the magistrate.

The families who returned to Pitcairn Island were visited in 1860 by the *Calypso*, and in conversation with the officers they explained that they had left Norfolk Island because it was not their own. They said that no one could be kinder than the Governor of New South Wales, but that a schoolmaster and a miller had been placed among them who were not of their own people, and some sappers and miners had also been quartered on the island; that their own magistrate was now responsible to government, and altogether they found it so different from the life of freedom and irresponsibility to all but themselves and their elected magistrates they had led at Pitcairn, that they had a longing to be back to the island where nobody could interfere with them, however good and kind the intention. They also loved the wild, rocky, luxuriant islet, with its cocoa-nuts and bread-fruits; with every foot of whose soil they were familiar, and in which they had all been born; and they compared it disadvantageously with the much colder, tamer, and less productive Norfolk Island, with no trees but gloomy pines, and nothing eatable but what was cultivated.

We have now, therefore, two distinct colonies of Pitcairn Islanders; and we trust, that the officious though well-meaning persons who so rudely broke up the happy and united community in its original home, will for the future leave these interesting people to manage their own affairs (for which they are quite competent), and to work out after their own fashion the many problems in physical, social, and political science which increasing population will soon force upon them. Alfred R. Wallace.

THE SEASONS.

SPRING.

Spring am I, too soft of heart
Much to speak ere I depart;
Ask the summer-tide to prove
The abundance of my love.

SUMMER.

Summer looked for long am I,
Much shall change, or ere I die;
Prithee, take it not amiss,
Though I weary thee with bliss.

AUTUMN.

Laden Autumn, here I stand,
Worn of heart, and weak of hand;
Say the word that sets me free;
Nought but rest seems good to me.

WINTER.

Ah! shall Winter mend your case?
Set your teeth the wind to face;
Beat the snow, tread down the frost!
All is gained when all is lost.

William Morris.

LITERARY NOTES.

The country of the "*Manimes*," from which Dr. Livingstone had not returned at the date of Sheik Said's letter to Dr. Kirk, recently forwarded to Sir Roderick Murchison, appears to be the "*Manyema*" country round Lake Ulenge, west of Tanganyika, which Dr. Livingstone announced his intention of visiting in the latest letter received from him in Europe, dated 30th May, 1869.

Two posthumous tales by Miss Austen will shortly be published. *Lady Susan* is a short one-volume story, and is regarded by the family as one of the earliest, if not the earliest, of her works. *The Watsons*, on the other hand, which will accompany *Lady Susan*, is written in her happiest manner. It is unfortunately unfinished.

The *Athenæum* of January 21 says:—

"Mr. Swinburne's new poem is ready for the press. It is said he has written a novel also."

This is incorrect. The two poems on which Mr. Swinburne is engaged, the epic "Tristan and Iseult" and the "Chastelard Trilogy," are neither of them nearly finished. As to the novel: he wrote one about seven years ago—indeed he has from time to time written several, both in English and French, though there is no reason to suppose that he is about to publish any of them. He is also engaged upon another story at present: but it is not "written."

M. Ivan Turguenief, who is still in London, has just published a new tale in the current number of the *Vyestnik Evropui*. It is a masterly study of a type of character not uncommon in Russia. Tyeglef is a military man, who, although possessing few or none of the qualifications for success in life, is morbidly bent upon applause, or at least notoriety. He is a fatalist, and he eventually takes refuge from the failure of his career in suicide. It has been a fashion with novelists in Russia to cast a halo over heroes of this order, or at least over their final catastrophe. M. Turguenief, on the contrary, has exhibited Tyeglef, and his exit from the world, in the most unromantic light possible. The name of the piece, *Stuk Stuk Stuk* (Rat tat-tat), is suggested by an incident in the story. A friend of Tyeglef's happens to tap three times on a piece of wood one night, and the fatalist, who is sleeping in the same room with him, imagines that it is a case of spirit-rapping. The friend, by way of a joke, keeps the sound going from time to time, and Tyeglef looks upon himself as the recipient of a most important message from the invisible world. He becomes very grave, and his gravity is intensified by a mysterious summons he soon after receives, when he hears his name called by an unearthly voice faintly heard through a dense fog, which seems to blur all sights and sounds. This fog, by the way, the Russian *tumàn*, is most poetically decribed, and throughout the whole story the reader is affected by a kind of sense of uncertainty and insecurity, as if he were feeling his way about in a thick mist, through which all things seemed to be what they were not. At the end the mist lifts, and everything appears in harsh distinctness of outline. But before then Tyeglef has put an end, by his own hand, to his most unsatisfactory life—leaving behind him a name which, thanks to Mr. Turguenief, has served to point a very salutary moral, and to adorn a most artistically executed tale.

In the last number of the *Edinburgh Review* is an article on Mr. Morris's poems, the first part of which is confined to illustrations of the sad "Carpe diem" keynote sounding all through these beautiful stories. In the second part the reviewer, contrary to his own promise, ventures into the region of criticism. The grand passions of the old heroes and deities, for which he seems to hold the poet responsible, are inexpressibly shocking to his feelings. In the pages which treat of the "Lovers of Gudrun," occurs a passage which is too characteristic of Philistine review-writing not to be quoted. When Kjartan cannot forget the lost Gudrun, the Scotch reviewer breaks out:—

"This is intolerable. What we would have is the plain duty of a Christian man, which in such a case would be, either that he should remain as he was, or that, as he could not marry the woman whom he had first wooed, he should betake himself to her whom he preferred to love, with a strange love great and sore."

In continuing his review of the history of witchcraft and magic in Spain, Señor de los Rios, in the last number of the *Revista de España*, shows how much the conquests of James of Aragon and St. Ferdinand of Castille, by placing a Mohammedan population in habitual and immediate contact with the Christians of northern Spain, tended to spread the belief in fatalism and the practices which accompany it. Several enlightened churchmen seem to have striven to stem the torrent of superstition. Among them a certain Friar Pascual, Bishop of Jaen, became best known as a denouncer of fortune-telling and charm-curing, and as a firm upholder of the doctrine of free-will. But for a long time the popular beliefs were too strong even for the Church of Rome to eradicate them; and the cavallaresque literature, afterwards ridiculed by Cervantes, appears to have come into Spain with the hosts of the Black Prince and Du Guesclin, and to have given fresh vigour to the old Moorish superstitions. The enchantments of Merlin, Freston, and Bracamonte were added to the fortune-telling and charm-curing of the Spanish Jews and Moors. The laws of the *Partidas* tolerated those who practised magic arts *with good intentions*, and astrologers were patronised and encouraged at the courts of John II. and Henry IV. But the great Queen Isabella set her face firmly against the toleration of all forms of the black art, and the measure of success which attended her efforts to extirpate them will form the subject of the next and last of these interesting articles on witchcraft in Spain.

The writer in the *Revista de España* who zealously defends the claims of Columbus against all comers, as the first discoverer of the New World, fails to see that, even if the Zeni or the Normans did not reach some portion of the Labrador coast a century or two earlier, these facts cannot detract one jot from the glory of the great navigator. This glory consists in the originality of his ideas, and in the single-minded heroism with

which he persevered until success was achieved. The bells of Gordar, now in the Copenhagen Museum, afford absolute proof that the Normans actually were in Greenland, and the story of their discovery of Vinland scarcely admits of doubt. But even if a Runic inscription were found on Watling Island itself, the discovery would not injure the fame of Columbus in the slightest degree.

Señor Barrantes has done very good service to the literature of Spanish discovery, in rescuing from oblivion the benificent life of Father Palencia, the apostle of the Philippines. In the last number of the *Revista de España*, the interesting notices of Palencia's labours are concluded, with some account of his literary work; including his Tagala grammar and dictionary, and his description of the habits and character of the Philippine Indians. It is remarkable that, three hundred years ago, Palencia should have introduced the system of mutual instruction among these people; but he looked upon Indians as children, and his rule closely resembled that of the Jesuits in Paraguay. In Palencia's lifetime there was no printing-press in the Philippines; but Antonio de Morga made free use of the good friar's manuscripts.

The Germans have just been celebrating the eightieth birthday of Grillparzer, "the Austrian Schiller." Probably few English readers have ever heard of this worthy old man: and yet the author of *Sappho* and *King Ottokar* is reckoned by his Austrian admirers, along with Goethe and Schiller, as one of the only three "complete poets" ("ganze Dichter") which the Fatherland has produced. *Sappho*, the best known of Grillparzer's tragedies, was performed at the Vienna Burgtheater, preceded by a prologue, and followed by the coronation of a colossal bust of the poet. The Emperor Francis Joseph signalised the occasion by decorating the poet, and presenting him with a salary of 3000 gulden. A further sum of 20,000 gulden was also collected for him, to found a prize for rising artists, and other objects. Poor old Grillparzer, amid all his honours, is said to have whispered to a friend, "Innocence has much to suffer. I cannot surely help being eighty years old." He has at present two more dramas completed, *Libussa* and *Ein Bruderzwist in Habsburg*, but does not wish them to be published till after his death.

EXHIBITION OF WORKS OF THE OLD MASTERS, BURLINGTON HOUSE.

II.

THE VENETIAN SCHOOL.

The visitor for the first time passing through these rooms suffers an overpowering feeling of admiration to take possession of him. Every picture appears to be fine and masterly. The second time he selects and finds selection agreeable, and at the third visit he goes direct to the great works, and wishes the rest away. Even painters who stand firmly on their own original qualities become offensive when we can only admire their technical abilities without sympathy for their views or intentions as artists. Nay, a virulent hatred arises, and a tendency to break the third command of the decalogue. There are no less than nineteen Murillos in this collection. From these canvasses the *canaille* of Madrid grin impudently at you; or "idealess girls" look upwards with stupid black eyes and long light-blue drapery, partially supported by an alarming number of real naked children, and backed by streams of yellow, an arrangement supposed to represent without impropriety the "Immaculate Conception;" or half a dozen frames (410-419) show you, with a vulgar and obvious force, the story of the Prodigal Son. Greuze, too, is represented by seven, in which girls of tender years, children almost, show their conscious charms, or the "Pedler" (393) struggles away from the dreadful old woman and the lewd young one, who would buy his wares without coin. Such is really the subject of this meagre picture, though now called simply "The Pedler," and originally "Le Geste napolitain." These, alas! are the things that brought the fabulous sums last year at the Demidoff sale—"Le Geste napolitain" bringing 2120, the "Young Girl with a Dog" (398) 3560 guineas. We should have liked to have seen the assembly of bidders that day at the Hôtel Drouot; no doubt it had a fine resemblance to Gerome's red-mantled circle in his "Phryne before the Court of Areopagus."

Let us turn to the extreme opposite of these, to the manly and patrician art of Venice, and the men whose names are in the Libro Doro of that school of colour. The first of these in the order of the rooms are two portraits by Moroni. The first, called "A Spanish Warrior" (10), has the date and the painter's name, "Jo. Bap. Moronus p. 1540," inscribed upon it, a rare thing after the beginning of the 1500. The complete absence of making up a picture here is refreshing, and also in the other, called "Titian's Schoolmaster" (14), where the hands are splendidly drawn, and express the character and the age of the man almost as much as his face.

Passing into the second room, we immediately come upon the Gio. Bellini, the "Virgin and Child, with Four Saints and the Donator" (92), a picture perfectly preserved, the only touching on it being a little opaque colour visibly rubbed into the high lights. The two early pictures on either side (91-93), SS. Mark and Sebastian, by Battista Cima, are in the same extraordinary state of preservation. In the Bellini, the Virgin places her hand encouragingly on the shoulder of the donor, who appears in the usual position from below, as if he knelt on the steps of the Virgin's seat, and the Infant blesses him with a sweet childish, yet curiously conscious, face. The S. John Baptist is a wild man of the mildest gentle nature, and the S. George, on the other side, is most probably a portrait, so very young he is. The sky behind these half-figures is quite pure; it is very blue, but of a peculiar character, graduated into the yellowish light below without any intermediate green; against this blue the white linen over the Virgin's head, enclosing, as it does, the warm flesh-colour that preceded Giorgione, and was only intensified by him and by Titian, is very bright and lovely. Other Venetian works there are in this neighbourhood: the Titian (63), "Woman taken in Adultery," in which we are led to believe only by the beauty of the woman's head, and the character of some of the male faces, and the Portrait by the same (84). This is a young Paduan doctor or student, not a very wise individual, but having a character of head seemingly much to Titian's liking, as the same forehead and mouth appears in many of his pictures. Here is also the Giorgione (94), "A Young Lady Professor of Bologna" (!), of which we may speak along with his others.

Entering the third room, we find (120) "Portrait of a Senator," by Bassano, a convenient name, a Senator or a Warrior being always satisfactory, or, if a Dutchman, a Burgomaster. This Senator is especially interesting to us, a noble example of the third generation, as we may say, of the greater Venetian painters. There is a lurid, and in some sort unintelligent, strength and violence in the colour and chiaroscuro of Bassano's compositions which does not here injure his excellent result. On the other side of the room is another of the same period (121), the Esther of Tintorette, a large picture, which it was surely unnecessary to bring in from Hampton Court; might indeed have been safely left for the delight of holiday makers.

The fainting Esther, and the group of women supporting her, has the superb and inexhaustible character of Tintorette; but the flesh, and particularly the shadows, which are as dark on the bosom of a woman as on red marble, give a diseased and hot sense, which prevents the gorgeous colour from giving any pleasure, without one knowing why. The Tintorette in the previous room (95), a small copy by the master, not the sketch, of the wonderful and overpowering picture in the Academia of Venice, has the same infernal atmosphere, but happily, as in many of his greater works, the subject warrants the unearthly effect. However this may be, we must recognise this lurid light and shadow as the passage into the region of "black masters," which resulted in the wholly artificial scheme of picture-making from which modern art has but lately emerged. Intellectual gladiators like Tintorette, or even Bassano in his baser way, are curses to their contemporaries and successors.

To return to the earlier men; earlier, we may say, because twenty years or thirty made a wide difference at that time in the development of the technique of art, as well as in its spirit; how candid and clear, and how lovely, is the colour and light in the Bonifazio (357), the sober brightness in the Virgin's eyes, and on the face of the lovely and innocent S. Catherine stooping forward. He has been called a pupil of Palma, but he was really a disciple of Titian, following him, a biographer, Boschini, affirms, "as the shadow follows the body," and this all his female faces show. Even in Venice, where Bonifazio is seen to greatest advantage, there are few finer examples than this. And not far from it hangs a Titian (365), nearly as fine relatively. It is called "Susanna," but is really a lovely and innocent woman, whose limbs are lucid and luminous as gold and pearl, who sees no harm in being aided in her toilet by two "senators," as they might be called, were they only portraits. This picture reminds one of the Giorgione in the Louvre, where a nymph in nakedness sits on the grass by a fountain, with two happy musicians, and a shepherd in the distance drives his sheep without thought of anything strange: a golden age, or at least a blessed age; and here we arrive at another Giorgione, "The Golden Age" truly, delightful beyond expression (334), another of Lord Dudley's pictures. "The Golden Age:" in a land of twilight, never changing—"a land in which it seemeth always afternoon"—warm as the south should be, but with a fresh coolness in the grey sky, a brown shepherd lies on the dark green, and a little less brown shepherdess, leaning on his naked limbs without fault, looks frankly at his dreaming but strong face. She holds the double flute in her hands, and he also has a flute; the music has ceased thousands of years ago, and here it still sounds from Giorgione's canvass. At the other side of the picture is a bunch of naked children, "Cupids immortal;" two have gone to sleep together, but with the third the day is not yet done—he climbs on the bodies of the others without hurting or waking them. But even Giorgione could not stop here without his *moral* or pretence of one. In the middle distance is a hermit or a philosopher—let us suppose him both—with a skull in his hand, which he intently examines, an incident suggesting the Hamlet morality, "to this complexion we must come," sadly spoiling the poetry of the picture. This morality we find in other pictures here (with the Germans of this date it was universal), and especially in the Portrait by the same painter (94), which has no doubt caused it to be called in the Catalogue "A Lady Professor." Another Giorgione is (227) "An Italian Villa, with groups of figures," a large picture that nearly embodies the ideal of a "pleasance" in the romantic poetry of a certain period. A marble colonnade forms a pergola, but how the vine grows it is difficult to say. Rose trellis surrounds the enclosure, trees are cut into tiers and roundels, and animals abound, deer, and rabbits, and a goat, and the joys of the chase are introduced in the shape of a hound extemporizing a hunt on its own responsibility: gentlemen stand idly talking, and, above all, fair and dark Venetian damsels look at you in a row behind a marble barrier, with flowers in their hands. A picture full of mundane pleasure—not a Golden Age—but neither has it any *moral;* a most interesting illustration of Giorgione's sensuous character. He was the first rebel, the first who threw off the service of the Church and the sentiment of religious mythology. Beauty and luxury were his only objects, and that wholly without the sensual bias of inferior natures. Moreover, his was beauty of colour, beauty as a painter sees it; he let the sculptor look after form, and the poet after ideas. Had he been asked what he meant here or there, he would have answered that he meant nothing, yet was he a born poet with his brush in his hand. The fourth Giorgione—for there are four in the collection—(185) is called "La Richiesta." What the request is, it is difficult to say, and yet how much there is in both the faces; confidences doubted and not to be trusted, solicitude and uncertainty, and a little merciless residuum at the bottom of the man's thought. They are well understood by each other, too, and the present request is not of deadly import. But Giorgione cared less for all that than for the rich full pleasure of the colour, the unity of the impasto. How completely Titian and Giorgione went together in this respect may be seen by comparing the green sleeve of Herodia (189), which we believe is a well known undoubted Titian, with the sleeve in "The Request:" not only is the colour the same, but the method of execution, as shown in the rough impasto of light yellowish white filled with glazing colour.

Let us point out one more picture, which might be Venetian, by Gentile Bellini possibly (306), "Israelites gathering the Manna—painter unknown." Here is a man in a turban gathering the food into an oriental silver vessel, which suggests Gentile, but the action of some other figures, particularly one seen from behind wearing a black doublet and yellow hose, are more like quite another school and master, Luca Signorelli. At all events, this is an early work of the highest beauty. It has a purism like Fra Angelico, and a naturalism as strong. It is small, painted on copper, possibly by a miniaturist who laboured all his life on the vellum page of Psalters and Books of Hours, but so purely felt and so primitively simple and natural in its near approach to the beautiful that we think it worthy of notice in the same page with Giorgione. William B. Scott.

Note.—In our recent notice of the three Botticelli pictures, the words "whether or not it is really from the hand of the master," were an interpolation intended to relate to Lord Dudley's picture (299). Mr. Maitland's glorious Nativity is unquestionably a notable work of the artist. Indeed, the long Greek inscription over the subject, which is no doubt contemporary with the execution of the painting, expresses that the work was done by Alessandro in 1500. W. B. S.

HENRI REGNAULT.

In the German Gallery, 168 New Bond Street, there was opened, just at the end of the year—and there is now remaining open, with additions from time to time—a small but remarkable collection of pictures by living and deceased French artists. This is the third Gallery in London where our neighbours may be seen in their school of Painting at the present moment. Here, among other very great and notable works—Louis David's "Dead Marat," for instance, and two small works of excellence by Ingres—are two immense canvasses, painted with tremendous power and daring. One of these is a portrait of General Prim on horseback, with a background of a wild crowd of Spanish military. The horse is magnificently drawn, and the General sits with perfect ease, an equestrian portrait of the most complete mastery of both man and horse.

The other is one of the most terrific subjects painted with the most unflinching truth. The scene is on a flight of steps in the Alhambra, all the walls shining with gold and colour. The only living figure is a gigantic Moor wiping his sword on his crimson robe, and looking down on his work: he is an executioner, and below him lies the trunk rolling over in the last struggle, and the separated head struck away from the body turns its dying eyes up (as it would seem) to the face of the executioner, while the blood flashes and spurts against the marble steps. The figures are gigantic, the style is decisive and something more than masterly—gladiatorial, and demonstrative to the last degree. The face of the Moor is without pity, that of the head shorn from its body without mercy; there is neither regret, pain, nor any human expression but that of unconquered mercilessness even at the moment of death.

These pictures—and this last described, really takes one's breath away—are by a young Parisian, Henri Regnault, who took the "Grand Prix de Rome" a year or two ago, and who has returned to Paris to die with a musket in his hand, fighting in the last sortie against the resistless Germans. On first seeing these pictures we asked ourselves whether such a power used in such a manner was a gift from God or the devil. It had a hot

taste that no other place than Paris could delight in: the painter seemed to rejoice in the Moor and in the act depicted. We could not decide for ourselves whether or not genius such as there exhibited itself should be praised or not; there did not seem to be the heroic element which enobles tragedy, and makes blood sacred. Fate in the shape of a rifle bullet has, alas, decided the question as to the further exercise of the great but doubtful talent. Regnault, it would appear, had a presentiment of death as he marched out, and affixed a card on his breast with his name and the address of a young lady to whom he was to be married; and when he fell he was carried thither, and died without the power of speech.

NOTES ON ART AND ARCHÆOLOGY.

A few words are due to the memory of Alexander Munro, the sculptor, well known in London for a considerable number of years, and much respected by many lovers of art. A Scotchman, and from the far north, he came from Sutherlandshire to London about twenty years ago, and immediately became popular, at least within a certain circle of artists and wealthy patrons, who kept him fully occupied. His busts had the extraordinary power of impressing the spectator at the first moment with the truthfulness of the portrait, and yet were not, on more thorough examination, found to express fully the character, years, &c., of the original. His medallions were nearly always very admirable, and in many cases highly beautiful. Indeed these will be the most enduring record of his professional abilities. His groups of children also were of extraordinary beauty. In statue sculpture he was rather pictorial than sculpturesque. On his health failing, he left London for Cannes, and here he modelled Victor Cousin, who had also fled thither in failing health; and Munro, after the death of the metaphysician, executed a marble bust for the government of France, to be placed in the Institut. He died on the 10th (January) at a little villa he had built for himself in the neighbourhood.

The *Panaro* of Modena of December 30 reports the discovery in a barn of two precious pictures; one of them a Correggio. This picture is above one metre in height, and represents a Presepe, with many figures, in very good preservation, of extraordinary strength of colour, with wonderfully painted accessories. The other is the upper part of a Christ, life size, and bearing the cross, painted on a panel by Gaudenzio Ferrario. The stupendous anatomy of the hand supporting the cross is very remarkable. These two masterpieces are now being exhibited in the Museum of Dr. Rusconi, in the Gallery of Vittorio Emanuele.

The Count de Gobineau is at present offering for sale a valuable set of Persian manuscripts and of engraved stones; the latter containing over five hundred specimens, and illustrating the whole history of the art in Asia, from its very earliest beginnings down to modern times. Of the manuscripts there are about a hundred, all of exceptional value, either from their rarity or from the elegance of their workmanship and the splendour of their decoration. There is a full descriptive catalogue of them in existence; which is once more accessible now that the gates of Paris have again been opened.

The designs for the new Opera House at Dresden have at last, in deference to a good deal of pressure from public opinion, been committed to Professor Semper, the distinguished architect of the old house, which was burned down last September year. From the elaborate description of the plans given in the *Augsburg Gazette* (Jan. 15), we gather that the glory of the new house is not only to surpass the glory of the old, but the structure is to be something quite original in character. The stage and its dependencies tower like a separate building over the large auditorium: thus revealing at a glance the uses for which the whole structure is intended. The impression of unity is lost by the consistent following out of this idea; but without any or much sacrifice of beauty. The ornamentation is in the grand style of the later Renaissance.

The cast is now completed for the statue of the late Dr. Whewell, which Mr. Woolner has in hand for the chapel of Trinity College, Cambridge. The figure is seated back in an arm-chair, with one leg thrown over the other, the left shoulder advanced, and left hand resting on the top of a book, which it supports against the thigh. The right arm is drawn back, and right hand slightly lifted—the attitude suggesting the sudden occurrence to the mind of a thought, presently to be carried out. We believe that what the artist has in this meant to suggest is Dr. Whewell's first idea of his endowment for the study of international law. The figure has in it much life, as well as gravity; and in the matter of likeness, Mr. Woolner has been particularly happy in seizing the singular half-smile which used to add a grimness of his own to the massive features of his model.

The same artist has also almost finished an important imaginative piece long since commenced—the relief, in nearly life-size, of Virgilia, the wife of Coriolanus. Taking the Shakespearian conception of her—as a wife too tender-hearted, and too much lost in the love of her husband to do anything but dread the event of war and pine for his return, and in his return too much overwhelmed to do anything but weep—the sculptor has thrown into this work a great intensity and modernism of sentiment. The figure is in high relief—of the fullest elaboration in the modelling of those parts which are as yet finished—in a seated attitude, with the head flung forward, and one arm resting along a parapet. Above the parapet, on a different scale, and in low relief, the actual triumph of Coriolanus is suggested by a group of Volsces huddling together behind their shields from his assault. The work will probably be exhibited at the Royal Academy this year.

The fourth (December) number of Zahn's *Jahrbücher für Kunstwissenschaft* is in great part taken up with a long synopsis of M. Labarte's *Histoire des Arts industriels au moyen âge et à l'époque de la Renaissance.* In the same number Dr. Lübke has an essay on the respective shares of Masolino and Masaccio in the various frescoes commonly ascribed to their joint workmanship; in which, following a hint of Dr. Zahn, he differs from the opinion of Mr. Cavalcaselle. The three main subjects of comparison are the frescoes of the Brancacci chapel at Florence, of the church of S. Clemente in Rome, and of the Collegiata and Baptistery of Castiglione di Olona; and concerning these Dr. Lübke's conclusions, made "aus frischer Autopsie," and from a comparison of internal evidence with dates, are—

(1) That the Brancacci frescoes one and all are the work of Masaccio by himself.
(2) That upon the S. Clemente frescoes Masaccio worked, if at all, only in a quite subordinate character, as pupil of Masolino.
(3) That, at Castiglione, the frescoes on the *roof* of the choir of the Collegiata were executed by Masolino before the year 1427, when we know him to have been in Hungary with his patron, Cardinal Branda; that the frescoes on the *walls* of the same choir were executed during his absence by his pupil Masaccio; those of the roof and walls of the Baptistery, again, by Masolino himself, after his return, and after the death of Masaccio—sc. between 1428 and 1435.

In the *Zeitschrift für bildende Kunst* for January the same prolific writer concludes a set of "Contributions to Italian Art and History," with an account of the Cathedral at Como.

The *Portfolio* for February 1st contains a photograph after one of the heads in Mr. Millais's unfinished picture of Moses, Aaron, and Hur.

Music.

Musica Divina sive Thesaurus Concentuum Selectissimorum omni cultui divino totius anni juxta ritum S. Ecclesiæ catholicæ inservientium; ab excellentissimis superioris ævi musicis numeris harmonicis compositorum. Quos e codicibus originalibus tam editis quam ineditis accuratissime in partitionem redactos ad instaurandam polyphoniam vere ecclesiasticam publice offert Carolus Proske, Ratisbonæ, sumptibus, chartis et typis Friderici Pustet.

The reappearance of this periodical, the publication of which had been suspended for nearly ten years, is matter of con-

gratulation for the students and lovers of ancient ecclesiastical music. Designed by the original editor, Dr. Carl Proske, in a thoroughly practical spirit—literally, for church use—this work, had it been brought to an end with the completion of the first series, might well have been regarded, from its contents, its typographical beauty, and moderate price, as in its kind the most important that has appeared in our time. The table printed inside the wrapper of one of the numbers just issued is a veritable epitome of the history of church music; presenting, as it does, the name of almost every master who has made himself a part of it, from the Fleming, Josquin Deprès, to Pitoni, "ultimus Romanorum." The new series starts with seven first numbers to four different volumes; one volume to consist of masses, another of motets, another of litanies, and another of vesper-music. It is gratifying to trace in the selection of their contents the influence of that same catholic spirit which gave such interest and such charm to the work while under the editorship of Dr. Proske; a catholic spirit kept in check, however, by a thoroughly cultivated taste—indispensable to the conduct of a work the materials for which, if they are not actually inexhaustible, there is no likelihood of any number of editors or publishers ever exhausting.

Whether a liking, unaffected and hearty, for the productions of the composers of the 14th and beginning of the 15th centuries—those of Dufay and our countryman Dunstable, for instance—is possible to a 19th century musician of however retrospective tastes, is a question. But from the end of the 15th century—the age of Josquin—down to the middle of the last, an unbroken succession of composers has been maintained whose productions, while of the highest interest to the student of musical history, are not wanting in charm even to those who have not familiarised themselves with the *idiom* in which all but the latest of them have expressed themselves. For, into whatever number or variety of "epochs" or "periods" the history of modern—*i.e.* of polyphonic—music may be divided, one great boundary line can never be obliterated or ignored—that which separates modern from ancient *tonality*. Everything wherein the music which attained perfection in the 16th century differs *essentially* from that of our own time grows out of the different scale systems accepted by the composers of those different epochs; or—if we may, without arrogance, so speak of our equals in invention and our superiors in certain branches of musical science—may be referred to the imperfect appreciation of the nature of a scale or key to which those composers had yet attained.

Of Vol. I. of the *Musica Divina*, four numbers have already been printed, each of which is entirely occupied by a mass; that in No. 1 by G. M. Asola, a Veronese of the latter part of the 16th century; that in No. 2 by the Roman, Francesco Anerio; that in No. 3 by J. L. Hasler, a Nuremberger of a little later date; and that in No. 4 by Palestrina, the type and glory of the Roman school. Asola's mass is for equal voices—a form, from the narrow limits within which the parts must of necessity move, which at once taxes and reveals the skill of the composer who works in it to the uttermost. As an example of how a few notes may do duty as the motive of a considerably prolonged work, this is of great interest. Anerio's is a "requiem" mass, in which several clauses are set in more ways than one—all of them presenting contrasts not less instructive than remarkable with the more dramatic but not more impressive settings of modern composers. The hymn "Dies Iræ," which forms so large a portion of the requiem mass, would doubtless in performance produce an imposing effect: the stanzas being in every instance begun by a single voice and concluded by a choir of four voices. Hasler's mass, over and above its intrinsic merit, has an historical interest as containing indications of that musical "renaissance" which was destined only a few years later to act so largely and so thoroughly even on the music—that of the Church—which would have seemed least likely to become subject to its influence. The mass by Palestrina, the "Tu es Petrus," though occasionally referred to in musical history, and occasionally met with in manuscript, appears now in print for the first time. Like many others of his best works, it is for six voices, two of which—always the lowest two—are dispensed with in several movements. Next to the serene majesty which cannot fail to strike the cultivated eye or ear during the perusal or performance of this work, will be the absence both of those vain repetitions of words and of that exaggerated emphasising of them, which disfigure most even of the finest modern works of the same class. In the setting of the "Credo," for example—that section of the mass which from its variety as well as its extent presents the most opportunities for, or temptations to, musical painting—we look in vain for that startling contrast between the first and second clauses of the "Crucifixus," to present which has been the obvious aim of every recent composer. With expression, no doubt, the movement abounds from end to end; but it is the expression, not of this or that article of belief, but of belief itself, and of the joy in believing. The notes and combinations of notes present themselves to our ears as did the Sages of Antiquity to the eyes of Dante:—

"Sembianza avevan nè trista nè lieta."

No. 1 of Vol. II. contains six motets, two by Orlando de Lasso, the Flemish contemporary and even rival of Palestrina; one by the later Felice Anerio, better known to us by his secular compositions; one by the Spaniard, Vittoria, and two others severally by Casciolini and Giovanelli—masters both, about whom musical historians are mostly silent. Of the two motets by Orlando de Lasso, No. V., an "Ave Maria" for six voices, is the more extended and interesting, characterized by much of the energy and all the grace of the composer. Anerio's motet, a "Laudemus Dominum" for two choirs, is singularly modern in its tonality and even construction; beginning and ending unequivocally in the same key, with a close to the first period in that of the dominant. Casciolini's "Angelus Domini" again is for two choirs; the composer belonging evidently to that later Roman school whose disciples had learned to turn *place* as well as tune and time to account in musical performance. The mere repetition of the same passages by a second and somewhat distant choir is, as we all know, one of the finest "effects" to which we have even yet attained in musical performance.

Of the four litanies in the first number of Vol. III., one is the production of that rare personage, in music, "auctor ignotus." We should assign it rather to a modern hand trained in an ancient school than to that of a veritable "old master." The three other litanies are severally by Orlando, the indefatigable and masterly, by his countryman Rinaldo de Mel, and Felice Cornazzaro, an Italian who died, in the service of the Bavarian court, in 1628. One and all have an especial interest for the student, as presenting such numerous examples of the same phrase harmonized in a variety of different ways.

Five psalms for "Even-song" occupy No. 1 of Vol. IV. They are most of them arranged in the most striking of all antiphonal forms, that in which a single voice is answered by a perfect choir of five or six voices. The first, "Dixit Dominus," is the work of Giovanni Gabrieli (the elder), and the four following of "unknown authors." The number is worthily closed by a clear and effective "Magnificat" for two

choirs, also by Gabrieli, famed for his masterly and effective employment of many voices.

I very heartily commend this work to musical students and—though with less hope of immediate practical result—to directors of choirs and choral societies. The latter, having first learned to understand, and therefore to like, the music of which it is made up, will have before them the more difficult task of teaching those under their direction to do likewise. The latter will at first dislike it, because they will inevitably at first perform it badly; and they will afterwards, perhaps, perform it badly, because they dislike it. But there is a stage or condition beyond this, for those who have perseverance to attain to it—one in which they will find themselves in the enjoyment of a pleasure at once true and new. To recover or discover the traditional mode of performance of this music—properly printed in the *Musica Divina* as it was written, without "marks of expression" of any kind—will demand time and thought. Indications of and helps towards it abound however in the music itself, and will reveal themselves sooner or later to those who study it earnestly. One hint may be thrown out in conclusion: that neither extravagant loudness nor extravagant softness were ever heard in the Sistine Chapel in its palmy days. Both are heresies which could only have sprung up among a people who, whatever their achievements in musical composition and in instrumental performance, have not yet become, and are still far from being, singers in the proper sense of the word. John Hullah.

We are compelled by the press upon our columns to postpone the next series of Schumann Letters until the second February number.—Ed.

MUSIC IN JANUARY.

With the new year has come in a variety in our London music which, it is to be hoped, will prove as lasting as it has already been found pleasant. The opening of the Lyceum for Italian Comic Opera was in itself a bold experiment, if only because it had already been made unsuccessfully; the manner of making it was still bolder. To the average English amateur comic opera—of necessity foreign, for we have none native—is too much of a puzzle to be altogether an entertainment; and an operatic performance, of whatever kind, without a "star," has hitherto shown little attraction for him. In the list of artists forming the Lyceum *troupe*, there was not a single name with which he could have had any association; that he has shown any desire to make their acquaintance may be regarded as a hopeful sign. The new company has been among us but three weeks, and has already performed five operas, *Il Barbiere*, *L' Italiana in Algeri*, *L' Elissire d' Amore*, Ricci's *Crispino e la Comare*, and *Ali Baba*, composed expressly for them by Signor Bottesini, better known to us as an executant than as an inventor. The favourable reception of the last—confirmed by repeated presentations before increasing audiences—is due less to its intrinsic merit, which is really considerable, and has been thoroughly considered, than to its freedom from affectation. It is neither Gallo-Italian, nor Tedesco-Italian, but Italian—Italian in its fluency, fitness for the voice, and, more than all, pervading buoyancy; just the opera which an Italian company of the present time would take in, and in their turns give out, with quite as much pleasure to themselves as to their hearers. The "business" of the opera chiefly rests on Sig. Borella, the only member of the company previously known to us by name, and whose performances, in almost every work as yet put on the stage, justify his reputation as the greatest living artist of his class. Of the *prime donne* of the company, Madlle. Colombo, who has no part in *Ali Baba* seems so far to have found the greatest amount of favour. She is young and well-favoured, both as to feature and voice; the latter having been formed with an amount of care of which recent Italian singing has presented few indications; and, though not yet quite an actress, there is a certain drollery—graceful withal—about her carriage which, supposing even it to be teachable—which is at least doubtful—Madlle. Colombo cannot have had time to learn. The new tenor, Signor Piccioli, has excellent intentions, but his physical gifts, which are considerable, have not yet been sufficiently trained. He produces his upper notes with difficulty, uncomfortably apparent to his hearers. The barytone, Sig. Torelli, is a clever singer and a cleverer actor. I have not seen him in what is said to be his best part, that of Dulcamara, but his Figaro is admirable, irresistibly comic, and yet thoroughly refined. Some of our very best resident artists, foreign and native, are in the orchestra, which nevertheless goes very badly. They play without either delicacy or force, maintaining almost throughout an evening that indolent *mezzo-forte* which is the invariable result and unequivocal index of want of discipline.

Two of our best public instructors in classical music, the Crystal Palace Band and the St. James's Hall Quartet, have begun work again. By the former, the two completed movements of Schubert's unfinished symphony in B minor were finely performed last Saturday week. The first of these is to me the most satisfactory movement of its class by the same composer with which I am acquainted: not because it contains more beauties than any other, but, on the contrary, because it contains fewer, presented, however, in a more orderly and intelligible manner than was the composer's wont. The Monday Popular Concerts have of late been additionally graced by the presence of Madme. Szarvady, better known here as Madlle. Wilhelmina Clauss. If we have made progress since Madme. Szarvady was last among us, so has she. Her conception and execution of classical music exhibit all their wonted fervour and finish, with the addition of something that time only can give even to the most gifted and carefully trained.

Mr. Henry Holmes, a native artist of whom we may be proud, renewed his "Musical Evenings for the Performance of Chamber Music," at St. George's Hall, on the evening of Thursday the 26th. His collaborators, as heretofore, are Messrs. Folkes and Burnett, and Sig. Pezze, individually excellent musicians and finished executants, and, in conjunction with Mr. Holmes, accustomed to work together. The Sextet in B♭ (Op. 18) of Brahms would have been the most interesting work performed, from its novelty alone. It has, however, stronger claims to attention. Brahms is generally regarded as an alumnus of the modern German school; though in the sextet performed on Thursday, there is not a trace of its influence beyond an occasional evasion of an imminent but time-worn form of its influence. It might have been the work of any master of the last half-century, who could have felt as deeply, and expressed himself as clearly. The first movement is based on a fresh and graceful thought, conscientiously followed out to its utmost consequences—generally on the self-same plan to which a Haydn, a Mozart, and even a Beethoven, have been content, in all essential points, to conform. The andante consists of a series of ingenious variations on what is either a "national melody" or a very happy imitation of one, and which has been suggestive of some ingenious and effective harmony. The scherzo, as scherzos are apt to be, was encored; and the conclusion of the rondo was followed by such applause as would hardly have been evoked by execution, quite as spirited and refined, of a less interesting movement.

Our chief foreign musical news is transalpine. The *Nuova Antologia* (of Florence) tells us that the performance of a new opera *Aida* composed by Verdi expressly for Cairo, and already paid for by the Pacha, has been postponed indefinitely through the detention of the scenery, dresses, and decorations in Paris, where they had been prepared! For the rest, the Italian journals have of late chiefly occupied themselves with lamentations over the dearth of new operas, and the incompetency of new singers, and with eulogiums on the composer Mercadante, who died at the age of seventy-four, on the 18th of December last. Mercadante's career is the most remarkable from its uninterrupted labour and all but uninterrupted unsuccess recorded in musical history. He was the composer of a prodigious number of—nearly a hundred—operas, the very names of the majority of which are already forgotten, and no one of which has kept the stage. For many years also he was the principal of the Conservatorio of Naples, once the first musical school in Europe, now, from whatever cause, all but extinct. Deficient in invention, he was unquestionably a skilful and learned practitioner of his art—a veritable *maestro*—who, despite his century of failures, leaves a great reputation behind him. John Hullah.

Theology.

THE DOGMA OF PAPAL INFALLIBILITY.

I.

Voices from Maria-Laach. [*Stimmen aus Maria-Laach. Die Encyclica Papst Pius' IX. vom 8. Dezember 1864. Neue Folge. Das Oecumenische Concil.*] Herausgegeben von Florian Riess und Karl von Weber, Priestern der Gesellschaft Jesu. Freiburg im Breisgau: Herder, 1868, 1869, 1870.

The title of this collection of pamphlets, *Voices from Maria-Laach*, probably conveys no idea to most Englishmen. Yet many of us have been much nearer to St. Mary of the Lake than we suppose. Up in the mountains which form the gorge of the Rhine, a few miles from Andernach, the traveller suddenly comes on a lake round and blue as the Lago Albano, and, like it, even to the unscientific eye, evidently lying in the crater of an old volcano. Across it, at the entrance of a wooded valley which opens on the lake, are seen the numerous towers of one of the oldest and most beautiful Romanesque churches in all Germany. Close to it lie the buildings of what was once a Benedictine abbey, and is now the house of studies for the Jesuit scholastics of a large part of the Teutonic race. From this house, sufficiently solitary for the purposes of study, near enough to Bonn to be a thorn in the side of the liberal party in that university, issues the series of pamphlets under the above title. The Jesuits of Maria-Laach, living as they do in the very midst of the conflict, understand its bearings and its vicissitudes even better than their brethren of the *Civiltà*. Before and during the Council they have issued a number of popular treatises on subjects connected with the famous Syllabus, such, for instance, as "The Council and the Modern State," "The Council and the Freedom of Science," and "The Modern State and the Christian School." They are now occupied with an explanation of the decrees which have been passed. In order to give the reader an idea of the series, I will chiefly give an account of two, that on "The Power of the Church, as a Teacher of Truth," and that on "The Dogmatic Constitution of the 24th of April, 1870."

It will be necessary for me to fill up the outline of the writers, in order to make these pamphlets intelligible in this country. In the latter, the decrees of the Council are printed and translated at length. Then comes a brief history of provincial councils since the Council of Trent. After this, under the head of "Fruits of the Vatican Council," follows a lucid commentary on the decrees. This contains a special reference to the motives of the convocation of the Council, which will be interesting to our readers. One reason of the unpopularity of the definition of the Pope's infallibility among men of the world is the circumstance that, as far as they know, it is utterly uncalled for. What possible reason is there why at this particular moment, when all was going on well, at a time of profound peace, the Catholic Church should be disturbed by a definition, uncalled for by any heresy? As everything must have a cause, the opponents of the Council have recourse to the old superstitions of the ambition of Popes and the intrigues of Jesuits to account for the portent, just as the Romans referred to Jupiter the appearance of a sudden flash of lightning in a sky perfectly serene. I think, however, that even the world dimly sees that its theory is inadequate to furnish a reason for the fact that more than six hundred men have fixed on their own necks a yoke which seems to it an intolerable burden, and which no doubt is an important restraint. The fact is, the reason for the definition lies in the history of Catholic Germany for the last fifty years. The Council itself has referred to the past in words which, according to the fathers of Maria-Laach, are "the answer to the objection of those in the present times who say that there is no heretical division in the Church touching points of the faith." In the preamble it is said that in consequence of the prevalence of errors, which it calls rationalism or naturalism, "in many sons of the Catholic Church, there has been a gradual loss of hold on truth, so that their Catholic instinct is enfeebled." "Every heresy," the pamphlet continues, "as a rule presupposes a preparation, that is, a gradual, more or less extended, more or less conscious, aberration from the instinctive faith of Christendom." I am convinced that with respect to Germany this guarded statement is under the mark. That has been going on in Germany which rendered the definition inevitable. Opinions have been held and expressed by professors of Catholic universities the tendency of which has been the destruction not only of Catholicism but of Revelation.

Three several times during the last fifty years, fundamental truths of Catholic Christianity have been imperilled and at least implicitly denied by German Catholic professors and priests. First came Hermes, professor of theology, at Münster, and subsequently at Bonn, who taught for twenty years the theory that all Christians are bound to put themselves, when they arrive at the full use of reason, into a state not of hypothetical but of real doubt. This he carried to its fullest legitimate conclusion; every man has at some period of his life to force himself to be an Atheist in order to believe in God. This strange error continued after the death of its author, and formed a party called Hermesians, who were condemned in 1835 by Gregory XVI., and whose principles are anathematized in the 5th and 6th canon of the present Council. The fundamental error of Hermes was plainly that the dogmas of Christianity are strictly demonstrable and discoverable by reason. Twice has the same error been repeated, though not in such a crude form, by men who strove to reconcile the independence of theological science with the infallibility of the Church and with revelation. In 1857 the present Pope condemned the opinions of Günther, an Austrian professor and a good priest, who afterwards retracted them. His view was that the theologian is to start with a total hypothetical and scientific doubt, and that the whole Christian scheme is capable of being strictly proved, while the office of the Church is confined to stating as an historical fact that that has actually happened which the human intellect could prove to be absolutely necessary. When I add that in his view the whole of the dogmas of Christianity, the Holy Trinity, and the Incarnation, can be necessarily deduced from the simple principle "*Cogito ergo sum*," the reader will not be surprised when I say that the dogmas which resulted from this chain of reasoning were not the Christian Trinity nor the Christian Incarnation. There must have been deep-seated heretical tendencies in Germany when a Catholic priest could teach such a system. Proofs are not wanted of the hold which the idea of "free theological science" had taken on the German mind. Voices arose from every part of Germany, which, while they corrected Günther's Cartesianism, exclaimed that the Holy Trinity could be metaphysically demonstrated, and that the contents of the Christian revelation were not simply above but immanent in natural reason. I must say that, as far as I am aware, the Catholic Tübingen school have not been guilty of such extravagancies, but the teaching made itself heard in almost every quarter of Germany. Posen was represented by Wohlmuth, Freiburg by Sengler, even Catholic Tyrol, and later Vienna, by Schenach. Munich, however, produced Froschammer, the man who has carried out what in others was a tendency boldly to its legitimate result. The patent

weakness of Günther's theory is in the open rationalism of the principle that Christianity is to be deduced by a strict reasoning process. Froschammer has corrected this by the substitution of a sort of mystical intuition which comes under the head of what the Council calls naturalism, and which reminds us strongly of the school of Mr. Maurice in England. In his system reason is a natural faculty of God-consciousness, and this reason is the sole principle of knowledge for Christian truths. Faith supplies stuff for this knowledge, but does not apprehend it. As this God-consciousness is a natural faculty, of course the theory breaks down the distinction between natural and revealed religion. Accordingly Froschammer distinctly holds that there is no difference between such a natural truth as the existence of God and a supernatural truth like the Holy Trinity. If, however, it be asked what is the use of revelation and of an infallible church, Froschammer answers that they are necessary to state historically truths like the Incarnation which depend on God's free-will, and also for the education of the human race, whose faculty of God-consciousness needs to be brought out by the historical evolution and continual progress of truth. Philosophy, then, that is, this historically educated universal reason, is the ultimate standard of Christianity, and is absolutely independent of Church authority. Froschammer was condemned by Pius IX., in a brief to the Archbishop of Munich in 1862, and has since given up all belief in objective religious truth and revelation. This sketch, brief as it is, sufficiently points out what our pamphlet means by heretical tendencies. It shows what is meant by "the freedom of theological science" in Germany.

It would take us too far to examine adequately the sense in which the "rights of reason and of philosophic science," as they are called in the brief condemning Froschammer, are reserved and guaranteed by the Church. The question immediately before us is the connection between the state of opinion in the Catholic universities of Germany and the definition of the infallibility of the Sovereign Pontiff. That connection is two-fold. First, in all these cases the expulsion of these errors from the Church has been effected solely and absolutely by the authority of Rome. The chiefs of Hermesianism among the professors of Treves submitted themselves to Rome in 1838, declaring that the decisions of the Holy See must be received without conditions. Günther, who, as appears by a passage quoted in the *Stimmen*, was himself an infallibilist, submitted to Rome. By Rome Froschammer was extruded from the Church. In point of fact, since the Council of Trent all heresies have been condemned solely by Rome; and the reason lies in the nature of things. Since the invention of printing, such is the breathless rapidity of modern thought that an Œcumenical Council is far too cumbrous a means for the destruction of error. It is simply ludicrous to suppose that a professor of a Catholic university is to be allowed to teach error while the Church is rendered mute by the impossibility of assembling what on this hypothesis is the only effectual organ of its infallibility. Half Germany would be infected before it could be called. If, secondly, it be asked what was the necessity of defining the Pope's infallibility when the submission of the disputants proves that the dogma was already acknowledged, I answer that it was not acknowledged. I can only point to the significant fact that at this moment, after the definition, an open opposition still exists, not among the bishops of the minority, but among a certain number of the class which cried out loudest for free science —Catholic professors. Among the causes of the definition is to be reckoned the Congress of Munich. There, in the glorious Basilica of St. Boniface, were gathered together the foremost men among the representatives of the science of the great German Church. Who can forget that among them voices were raised for the unqualified independence of science? Not for a moment do I impute to Dr. Döllinger the errors of Froschammer. Yet, I cannot forget that on that occasion he put history into the position which by a legitimate deduction would raise it to the authority which Froschammer assigned to philosophy. He refused the name of theological science to the analysis of existing dogma, and affirmed that he alone was a theologian who could trace the history of Christian doctrine to its source from the first ages. As if the ever-living Church of to-day did not present a definite body of Truth, susceptible of being reduced to a science! In the name of the freedom of science, he affirmed that error, even theological error, by which he meant real acknowledged doctrinal error, only short of actual heresy, was to be left to itself, because authority had no right to interfere with it. In this he meant to affirm the theory that the condemnation of error as distinguished from heresy cannot be infallible, and to denounce the practice of the Holy See in condemning books and opinions by means of its Congregations. We all know that not all the acts of these Congregations are infallible, but, even when not infallible, they are the warning of the Holy See conveyed to an author that his book contains error. In all this there is such an unmistakable tendency to substitute the professor for the authority of Rome that it calls for and explains the definition of the infallibility of the Pope. That the magnificent Church of Germany, with all its unrivalled wealth of learning and thought, is sound at the heart's core, I have no doubt. Nevertheless, I can only agree with Maria-Laach in seeing in the history of the last fifty years an explanation and a justification of the Council. The Church had to make its choice between the infallibility of the Holy See and the infallibity of the professors. It preferred the former.

J. B. Dalgairns.

(*To be continued.*)

Intelligence.

The Recovery of Jerusalem, by Capt. Wilson and Capt. Warren. —As a record of gallant self-devotion to a good cause, this work will be read with deep interest. It is true that biblical archæology is not materially advanced by the researches described. "The results of the excavations down to the foundation of the Haram wall . . . . . do not lead to any more definite conclusions as regards the architectural style of the Jewish nation than can be learnt by those portions hitherto exposed to view" (p. 389). But if the Society's operations are continued, the problems connected with the topography of Jerusalem may in time be expected to receive a decisive solution (see Dean Stanley's remarks, pp. xvi–xviii). The palæographical results of the expedition are also not inconsiderable, though but little information respecting them is communicated in this volume. A large share in the rescue of the Moabite stone belongs to Capt. Warren, and though Mr. Holland (p. 546) ignores the fact that German orientalists had already ascertained the linguistic character and value of the Sinaitic inscriptions, still such a large number of accurate copies as Mr. Palmer may be expected to furnish, together with an independent translation, will be of great importance for Semitic philology. Nearly two-thirds of the volume is occupied by the very interesting narratives of Capt. Wilson on the Ordnance Survey of Jerusalem, and of Capt. Warren on the excavations. Part II. consists of seven papers of a wider range, the most important of which is Mr. Holland's on Sinai. Jebel Mûsa is stated to be the true Mount Sinai, while Rephidim is identified with Feiran, and the Wilderness of Sin with the plain of El Murkhah. The description of the causes which may have led to a diminution in the fertility of Sinai should be consulted by the student of Exodus. A paper on the Hauran, contributed by the Count de Vogüe, is chiefly important from an architectural point of view.

We have reason to believe that Dr. Ginsburg's visit to the land of Moab is postponed till next year. Meantime it is pleasant to record the foundation of a new society, independent of the Palestine Fund Association, for the promotion of historical and archæological researches connected with the principal Biblical lands.

Dr. Muir has placed at the disposal of each of the Scotch Universities the sum of 100*l.* as a prize for Hebrew scholarship and the criticism of the O. T. Scriptures.

Contents of the Journals.

The Theological Review, January.—The most important article is that on the Revision of the Authorised Version of the Old Testament, by Mr. R. Martineau. Its object is to show that nothing short of a new translation will meet the exigencies of the case, principally on the ground of the ignorance of Hebrew syntax, displayed in the current version. The facts are true in the main, but exaggerated, and the translations of select passages leave much to be desired on the score of taste. Dr. Davidson discusses the sense in which the quotations from the Old Testament in the New were intended by the New Testament writers. Mr. Wicksteed devotes a thoughtful and appreciative paper to Roskoff's History of the Devil. He points out, however, the one-sidedness of the picture of the middle ages, and the inaccuracy of an important quotation from S. Eligius, and desiderates a better explanation of the phenomenon, that the most terrible persecutions for witchcraft occurred in the 16th and 17th centuries. The other articles, though interesting, scarcely require a particular description.

Continental Reviews of English Books.—Three articles deserve special mention under this head. 1. On Prof. Max Müller's Lectures on the Science of Religion, by C. P. Tiele, in De Gids for January. [The judgment expressed is nearly identical with that of Prof. Whitney, the American Sanskritist, in The Nation, Oct. 13, 1870, from whom Mr. Tiele disagrees only in admitting that the materials are already collected, and the foundation laid, for a genuine Science of Religion. Both insist on the fact that Prof. Max Müller's theory of the growth of polytheism does violence to sound psychology, and that the men who first offered sacrifices to Dyaus, were in reality fetish-worshippers, that is, they adored the visible heaven as a living divine being.]—2. On Dean Hook's Life of Cardinal Pole, by Alfred von Reumont, concluded in the Bonn Theologisches Literaturblatt, Dec. 19. [The article is extremely severe, but the final verdict not unappreciative.]—3. On Cheyne's Book of Isaiah, by Prof. Schrader of Giessen, in the Darmstadt Allgemeine Kirchenzeitung, No. 46, 1870. [The criticism is courteous and favourable; on points connected with Assyrian history the reviewer holds an opposite opinion to the author.]—4. On the same, by Dr. Kuenen in Theologisch Tijdschrift, Jan. [Favourable, with an answer to the objections of a "liberal" critic in the Spectator.]

Jahrbücher für deutsche Theologie, vol. xv. No. 4. The reviews in this number are, as usual, more important than the essays. The best are two by C. Sigwart of Tübengen, on E. Schürer's Schleiermacher's Religionsbegriff, and P. Schmidt's Spinoza und Schleiermacher, which contain many acute remarks on the fundamental assumptions of Schleiermacher's system. Prof. Wieseler writes on the Epistle of Barnabas, which he believes to have been written under Domitian, the "little horn" of the Epistle. Dr. Herrlinger concludes his studies on the theology of Melanchthon. Professor von der Gottz writes on the true view of dogmatics, as neither a historical nor a speculative science, but the normal development of Christian truth, derived, 1, from religious experience; 2, tradition; 3, the Scriptures.

Archiv für wissenschaftliche Erforschung des Alten Testamentes, vol. ii. No. 1. The Arabic translation of the minor prophets in Cod. Hunt. 206, edited and translated with notes by Dr. R. Schröter, II. Joel.—Rashi's influence on Lira and Luther, by Dr. Siegfried.—On the language of the Targum on Proverbs, and its relation to the Syriac version, by S. Maybaum. [An attempt, based on a critical revision of the text, to shew (against Dathe) that the mixture of Syriac and "Chaldee" in this Targum belongs to the original language of the author, and that the Peshito is largely dependent on the Targum.]—On Amos v. 26, by Dr. K. H. Graf. [Regards the perfect tense in v. 26 as prophetic:—"Ye shall take up your idols, and carry them to your place of exile."]—On the stone of Mesha, by Dr. Himpel. [See under Oriental Philology.]—The natural history of the Phœnix; on Job xxix. 18, by Dr. Merx. [Shows from the Syriac version, as corrected from S. Ephrem and Barhebræus, that קְנִי is a corruption from קָנָה "sweet cane," which was proverbial for durability.—On the two books of Zechariah, and on Cant. III. 9, 10, by J. G. Vaihinger. [Renders אהבה in the latter passage "a gift of love."

British Quarterly, Jan.—The explorations in Palestine.—The Greek New Testament of Dr. Tregelles. [Descriptive, rather than critical.]

Physical Science.

THE ENGLISH AND AMERICAN ECLIPSE EXPEDITIONS.

In the absence of detailed reports from the various detachments of the Eclipse Expedition, it is impossible to form any definite idea as to the additions to our knowledge of the constitution of the sun which may result from this expedition. But from the notices which have been published in *Nature* (vol. iii. pp. 221, 228, and 249) and in several newspapers, it would appear that, though the observations were in nearly every case made under most unfavourable circumstances, there is reason to hope that some results have been obtained which will at least prove most useful in directing future observations.

The notices already mentioned, giving as they do a more or less popular account of the observations, are in some respects exceedingly obscure, but some points of interest are to be gathered from them. The sketches which have been made of the corona appear to differ greatly from one another even in the case of observers at the same place, a circumstance which seems to indicate that some of the details are subjective, as the differences are not of such a character as to be accounted for on the hypothesis of different degrees of sensitiveness of different observers to faint light. But as in the case of many parties, the individual members of each produced sketches having a general resemblance to one another, and these sketches were likewise in general agreement with photographs of the phenomenon which were obtained; it is clear that some portion of the phenomenon is objective, though the differences between the sketches made by different parties seem to point to our atmosphere as being to some and indeed to a great extent instrumental in its production. Some excellent photographs were also obtained by Mr. Brothers, at Syracuse, but it does not appear from the notices yet published whether they show the peculiar dark intervals observed in the corona in Spain, and indicated in photographs taken in the latter country. Such agreement or non-agreement between the photographs taken in the two countries will doubtless give material assistance in deciding how much of the whole phenomenon is to be referred to a real existence, and how much to the action of our atmosphere on the light passing through it.

On the other hand, there seems to be a general agreement as to the existence of a shell round the sun having an angular depth of from 5′ to 7′, including what has hitherto been known as the chromosphere.

The spectroscopic observations lead to the conclusion that this shell consists not only of incandescent vapours of

several elements, and especially of incandescent hydrogen, as has long been known, but also, in the part remote from the sun, of hydrogen at a much lower temperature, and some gas or vapour, which must be inferred to be of small density, perhaps even of a density less than hydrogen, and which shows itself by the production of one or more green lines in the spectrum. The observations of Mr. Abbay on the general light received during totality appear to give very definite evidence of the existence of this gas or vapour; but his method of observation will not permit any inference as to the existence of this substance alone without hydrogen in the higher regions of the chromosphere.

The agreement between one of these green lines and a line which has been observed as occurring in the light of the Aurora leads to a most interesting speculation as to the existence of this gas or vapour in the higher regions of our own atmosphere.

With respect to the polariscope observations, from which it was hoped that some evidence might be obtained, not only as to the objective existence of the corona, but also as to whether it be an appendage of the sun, and whether it be self-luminous—or merely shining by light reflected from the main body of the sun—so far as these observations have yet been published, they fail altogether to give any definite information, and leave this question practically as it stood before the recent eclipse.

The unfavourable state of the weather during the eclipse, and the presence in the neighbourhood of the sun of masses of cloud, will, it is feared, prevent any use being safely made of these observations. The results, so far as they have come to hand, are most conflicting, and can only be accounted for by supposing the existence of disturbing causes to such an extent as almost to preclude the hope of our arriving at definite conclusions. The details of the polarisation observations made at Syracuse will be looked for with much interest, as they appear to have been made under circumstances more favourable than were experienced at other stations.

R. B. Clifton.

FATHER SECCHI ON THE ECLIPSE.

The following letter from Father Secchi is communicated to the *Gazzetta ufficiale di Roma*, by Father Rosa, of the Observatory of the Roman College :—

Augusta, Dec. 22, 1870.

This was the day for which we had made so many careful preparations. It began amiss. A rapid fall of the barometer warned us that a squall was imminent, and in the night we had rain, and a furious wind, which gave us great cause for anxiety. The tents set up for the observations, however, stood it bravely, and everything remained in order. The temporary observatories, placed on the summit of the height occupied by the citadel, and on the highest buildings of the castle, could not have been more completely exposed to the wind, and if it had not been for a place of shelter extemporised on the windward side, it would have been impossible to do anything with the photographs. A more inconvenient station in such an uncertain season could not have been chosen. However, every precaution was taken, and hitherto there has been no disaster to record.

The observers were divided into four groups. I was to undertake the photographs, and with me was Father Denza, who was to study the spectrum of the corona. My occupations only allowed me to take a superficial view of the protuberances, but this was most important, in order to compare the forms seen in the spectroscope with those which were to be seen during the totality. During the morning it was to be my duty to examine with the spectroscope the whole of the solar periphery. P. Denza, my colleague, was to observe the spectrum of the corona, and for this I had added our Dolland's finder to his excellent telescope, furnishing it with a small spectroscope, which, for the sake of having more light, was a direct-vision one. Sig. Delisa, the assistant at the Observatory of Palermo, was to assist him in this investigation. I was to superintend all the photographic operations.

The second group consisted of Sig. Cacciatore and Agnello, who undertook to record the time of the phases, which we, who were engaged in physical researches, could not observe during the totality, and they also undertook to measure the various phases. With them was Sig. Blaserna, who gave his attention to the polarisation of the corona.

The third group was formed of Sig. Donati, director of the Observatory of Florence, assisted by Sig. Cantoni Paolo, professor at Messina, and was to be employed on the spectrum of the protuberances, and was provided with a spectroscope of great dispersive power.

The fourth group consisted of the meteorological and magnetic observers, who were to examine their instruments every five minutes, and of assistants who were to note down any accidental phenomena that might take place.

This was our programme. Each group had made its arrangements in accordance with what had been agreed on at Florence, and acted independently. The meteorological department was under the direction of P. Denza, to whom I had also entrusted the magnetic observations which were to be made at the same time as the meteorological, and which were continued for ten successive days, with the assistance of two officers of the navy, and some other persons.

During the days of preparation, Professor Donati and I, assisted by Father Denza, employed ourselves in taking observations of the time, and of the latitude and longitude, and also in determining the local magnetic elements. These observations were so complete and accurate that they would be sufficient alone to constitute a considerable scientific harvest, and to justify our expedition even if no other results had been obtained.

Everything being thus arranged, the morning of the looked-for day dawned bright and fair, but with the barometer extremely low, and a west wind. These circumstances augured ill; however, I hastened to analyze spectroscopically the solar limb, and I found it richly furnished with protuberances of every kind, of which I made a careful drawing.

Towards midday, the cirrus-clouds began to disturb us; but the sky was still clear in places, and we succeeded in taking fourteen very good photographs of the partial phases of the eclipse. But a quarter of an hour before it became total, the clouds began to thicken, favoured by the chill following the occultation of the luminary, and, unfortunately, at the very moment of totality, a cloud thicker than the others passed by, robbing us of about half the precious time.

Happily it vanished speedily, and in the few remaining seconds we were able to secure a result which prevented our labours from being in vain. We obtained at the direct focus a photograph of the protuberances, which form a beautiful small semicircular corona. I was able to see the protuberances, and to compare them with those which I had seen in the morning. I found that I was not mistaken, and that it was really full of the well known rosy jets, of admirable shape and beauty, which confirm the received view that they extend all round the sun, differing in height in different places. Those which we see with the spectrometer are only the most colossal and gigantic, so that, in spite of this valuable invention, eclipses are not useless. The rose-colour was in many cases tipped with a bright yellow, a thing I had already seen in Spain. The shortness of the time, the interruptions from clouds, and the other things I had to do, prevented my seeing everything. But I noticed here, too, what has been observed in Spain, that on removing the coloured glass after the sun had disappeared, the naked eye applied to the telescope could still discover it as a slender brilliant thread, which vanished immediately afterwards.

The corona was almost lost to us by the unlucky cloud, but it was seen a little way off, and Sig. Blaserna found it strongly polarised. In the town it had been sketched with success, as the effects of the cloud were less disastrous there. P. Denza executed the part assigned to him to admiration. As soon as the cloud had passed, he saw the protuberances clearly, and, choosing the clearest and most brilliant part of the corona, he directed the spectroscope towards it, and whilst the assistant kept it fixed, he was able to distinguish plainly the spectrum of the protuberances from that of the corona. This last was continuous, and had two very brilliant bands, one in the green near Fraunhofer's E, and another in the yellow-green. Thus a great problem is solved, and we see that it is possible to pursue this study with different instruments, taking care not to weaken the light for the spectroscope with the analyzing glass. The shortness of the time and the difficulty of calculating the scale would not allow us to fix the lines in question with more precision.

It is not for me to report the results obtained by my other colleagues, but I may say without indiscretion that Sig. Donati succeeded admirably

in analyzing the protuberances with his instrument, and that this, too, marks a step in science. All the meteorological observers brought us a magnificent harvest of data, which it would take too long to enumerate in detail. I will only say that Sig. Cav. Pistoia gave us an excellent description of the flight of the lunar shadow over the wide landscape and over the heaven itself, which being covered here and there with clouds lent itself readily to such a study; the extent of the shadow being less than in Spain, this was the more easy to do.

The instant after totality I applied the spectroscope to ascertain the forms of the protuberances and to identify them, and found that the most beautiful of them, which appeared to me to have the form of a fine *cauliflower* tipped with yellow, retained its shape when seen in the spectroscope, but appeared lower down in the red zone. Sig. Donati assured me that he had seen the yellow line above the red. This fact proves that the element which produces the yellow line is something different from hydrogen, and gives us an additional impression of the complicated form of the protuberances. It may be that this opens a new horizon, and that our spectroscopic studies will have henceforward to include a comparison of the forms which the protuberances present in the different colours of the spectral bands.

I also examined the spectrum of the horns in the phases when they were sharpest, but found nothing except what I think I have seen in full sunlight, that is, a slight broadening of all the lines, discontinued at their summit, which I could not at the time explain to myself.

We then took a few other photographs of the phases, and ended the day's work by taking the sun's altitude with the altitude and azimuth instrument lent to the Commission by the Army Staff.

The results we obtained were certainly not all that could have been desired, but they are still highly interesting, and may be of use to science in various ways, as will appear better when the full reports of the separate observers are collected together. At least as much was done as we could reasonably expect after the meteorological warnings of the day before, and the same was the case more or less at other stations, where the operations were impeded by clouds. Let us hope that, when all these observations have been collected, this solar eclipse may prove to have been not less fruitful in scientific results than its predecessors.

P. A. Secchi.

P.S.—We have received a few communications by telegraph from distant stations. At Villasmundo, Sig. Ragnard observed the corona under very favourable conditions, and found its light strongly polarised, with the plane of polarisation in the direction of the ray of the solar disk. This confirms the results of Sig. Blaserna's observations, which might be disputed on account of the clouds through which the corona was seen. Thus we now know that the corona is reflected light. And this, at any rate, is an important discovery. At Terranova, the other part of the Commission verified one of the bright lines of the corona which were observed by P. Denza. At Syracuse, the weather is said to have been fine; at Catania, partly favourable, partly the reverse. Our English friends under the castle were not able to do anything. The people of the country were a good deal amused, and there was a popular *fête* with music, &c. The rest another time. A. S.

Of the variations in terrestrial magnetism during the eclipse, which it is to be regretted were not investigated by any of the English or American parties, Sig. Diamilla Müller gives the following report in the *Gazzetta ufficiale del Regno d' Italia*, January 17:—

On the 22nd December the needle followed its usual course till the commencement of the eclipse. At that moment it ought to have continued its usual motion from east to west. Instead of this, soon after the first contact, its ascending motion stopped, and it retraced its steps till it reached its *minimum* declination at $1^h\ 58^m$ (Terranova mean time), exactly at the instant of totality. From the moment of totality to that of last contact, as the disc of the sun gradually reappeared, the ascending motion towards the west began anew; and at the end of the eclipse the declination needle had returned to the precise position which it had quitted at the beginning of the phenomenon.

The following are some of the more important results arrived at by other members of the Italian Eclipse Expedition parties at Terranova on the south coast and Augusta, and communicated on the 8th of January to the Scientific Society of Palermo:—

Professor Donati, with an equatorial to which was attached a spectroscope of six prisms, on examining one of the prominences which he had studied before the eclipse, found a bright hydrogen line, and a yellow line more refrangible than the sodium lines, but no trace whatever of iron lines.

P. Denza, who also made spectroscopic observations, discovered a bright line near E, and another probably due to nitrogen.

From Terranova Sig. Tacchini reported that exact measurements had been made of various bands, amongst which was the bright coronal band, whose position was fixed by three separate observations; so that this may be regarded as finally determined.

Nobile and Whitting together observed this line, so that the one set of results may be checked by the other.

Sig. Tacchini also said that a comparison of the forms of the protuberances, as seen with the naked eye during the eclipse, and of those seen in the bright lines of the spectroscope in full sunlight, showed the accurate agreement of drawings made in entire independence of one another.

But by far the most important of these were the examinations of the corona by Professor Blaserna for polarised light. Using a Savart's polariscope attached to a telescope, he examined three points situated at a distance of 45° from one another; the polarisation was most pronounced, and nearly of the same intensity as that of the atmosphere seen on a clear day at a distance of 50° from the sun. At the distance of three lunar radii, there was no trace of polarisation, all errors due to the influence of the atmosphere having been eliminated.

Summing up his observations, Blaserna said that "he found that the corona was strongly polarised, whilst at a slight distance from the sun there was no trace of polarisation. The direction of polarisation was determined in three distinct points, and proved to be identical with the plane of the tangent or of the solar radius. This shows that the corona has no light of its own, but receives it from the sun's photosphere. In reference to a doubt expressed by Father Secchi in one of the Florentine journals with respect to the trustworthiness of these observations owing to the cloud, he insisted that the action of the thin clouds consists in destroying or at least diminishing the amount of polarised light, but they do not polarise a light which is unpolarised, so that, if, notwithstanding the clouds, the light of the corona remains polarised, this proves *à fortiori* its polarisation." Professor Blaserna added "that it was a clear result of his observations that the plane of polarisation is different for different parts of the corona, and that the only question left undecided owing to the special nature of his own instrument was whether this plane coincides with the solar tangent or radius.

Scientific Notes.

Biology.

Migration of White Blood Corpuscles.—In the last part of *Humphry and Turner's Journal of Anatomy and Physiology*, Dr. Caton, of Liverpool, contributes an important communication on the Cell-Migration Theory, in which he gives the results of his examination of the blood-vessels of the mesentery of frogs, and corroborates in all essential points the observations of Addison, Cohnheim, Stricker, and others, respecting the escape of the white corpuscles of the blood through the walls of the smaller arteries and capillaries. Dr. Caton observes that he operated on nearly a dozen frogs in succession without seeing anything more than, first, a dilatation of the vessels, secondly, a gradual retardation of the flow of blood till complete arrest occurred, the parts being always considerably congested, and, thirdly, a tendency of the white corpuscles to arrange themselves on the inner surface of the vessels, presenting at the same time active amæboid movements. In none of these cases was the passage of the corpuscles through the vascular walls observed. At a later period, however, when operating, near the commencement of summer, on strong healthy frogs, the migration of the cells was distinctly witnessed; and he gives sketches of the forms assumed by the corpuscles as they traverse the walls. He has not observed any migration of red corpuscles. Fishes did not prove good subjects for this kind of experiment, but the migration process was observed in perfection in tadpoles.

Consciousness and the Seat of Sensation.—Dr. Cleland of Galway contributes to the same periodical an interesting essay on the physical relations of consciousness and the seat of sensation, in which he calls in question the generally received doctrine of sensation which necessitates the assumption that "the functional union of the parts of the periphery with different termini in the brain is primordial, and that the surface of the body is minutely represented or repeated by a number of points in the brain, which, however, confusedly massed together, derive their

properties from their connections," and maintains that "the consciousness extends from its special seat so far as there is continuity of the impressed condition; that when an irritation is applied to a nerve-extremity in a finger, or elsewhere, the impression (or rather impressed condition) travels as is generally understood, but exists for at least a moment along the whole length of the nerve, and that as soon as there is continuity of the impressed condition from finger to brain, the consciousness is in connection with the nerve, and is directly aware of the irritation at the nerve extremity. Or, the position may be shortly stated thus: functional continuity between nerve extremity and brain is proved to be necessary for sensation, while, on the other hand, existence of distinct routes of sensation between them is highly improbable; and, seeing that functional continuity is sufficient of itself to explain the phenomena, we are not entitled to assume the existence of distinct routes, as has hitherto been done."

The Theory of Natural Selection.—In *Nature* for Nov. 10, Mr. A. W. Bennett discusses the theory of natural selection, which he holds to be inadequate to account for the origin of species. Taking as his starting-point the two principles laid down by Mr. Darwin himself, that natural selection always operates through the perpetuation of exceedingly small changes, and that every change thus perpetuated by natural selection must be directly beneficial to the individual, he applies these principles to the phenomena of Mimicry, as illustrated in Mr. Wallace's *Contributions to the Theory of Natural Selection*. Mr. Bennett maintains that in those cases where a butterfly mimics exactly the external facies of a species belonging to a different tribe, the amount of change in the direction of the species ultimately mimicked which can have been established in a single generation, is so small as to be absolutely useless to the individual, and hence, according to one of the cardinal principles of the Darwinian hypothesis, cannot have been brought about by natural selection. He then traces a connection, which he believes to have been overlooked hitherto, between the development of the power of mimicry or protective resemblance, and that of instinct, in the various classes of the animal kingdom, and argues that their parallelism must result from some connection between these phenomena. In conclusion, he contends that Mr. Wallace's abandonment of the theory of natural selection in accounting for the development of man and of the various races of mankind is inconsistent and illogical, and that whatever "intelligence," as Mr. Wallace expresses it, has been operative in the origination of man, the same principle must have been at work also in the evolution of the various lower races of animals. In reply, Mr. Wallace and other naturalists maintain that the steps necessary to transform a butterfly from its normal facies to one imitating exactly an entirely different butterfly of another genus, need not be so numerous as is generally supposed; and that each step may be proved to be directly beneficial to the individual; and hence natural selection is amply sufficient to account for the whole phenomenon. In a subsequent number (Dec. 22) Mr. A. Murray attributes the phenomenon of mimicry to an entirely different cause, that of hybridization, drawing a parallel between the hybridization which he assumes in Lepidoptera and that which is known to take place in plants. This theory is strongly opposed by other entomologists, mainly on the ground that it is unsupported by observed facts, and that from the crossing of plants belonging to different species of the same genus, no assumption can be made that butterflies belonging to entirely different genera and even orders can possibly hybridize.

Botany.

Transpiration of Aqueous Vapour by Leaves.—Dr. M'Nab, of Cirencester College, has just published (*Transactions of the Edinburgh Botanical Society*, vol. xi.) a paper on this subject. A series of experiments which he has instituted led to a number of interesting results, of which the following are the most important: 1. Quantity of water in the leaves. The mean of several experiments gave 63·4 per cent. 2. Quantity of water removable by calcium chloride, or sulphuric acid. This was found to be from 5·08 to 6·09 per cent.; while the sun caused about the same quantity, 5·8 per cent., to be transpired. The remainder, from 56 to 57 per cent., was therefore determined to be fluid in relation to the cell-sap of the plant. 3. Rapidity of transpiration in sunlight, diffused light, and darkness. The results given are, in sunlight, 3·03 per cent. in an hour; in diffused daylight, 0·59 per cent.; in darkness, 0·45 per cent. 4. Amount of fluid transpired in a saturated and in a dry atmosphere in the sun and in diffused daylight. In sunshine the experiments gave 25·96 per cent. in an hour in a saturated atmosphere, 20·52 per cent. in a dry atmosphere; in the shade, none whatever in a saturated, 1·69 per cent. in a dry atmosphere; thus confirming the results obtained some time since by M. Dehérain (see *Academy*, vol. i. p. 46). 5. Quantity of water taken up by leaves when immersed in it. The mean of several experiments gave 4·37 per cent. in an hour and a half. 6. Quantity of aqueous vapour absorbed by leaves in a saturated atmosphere. Dr. M'Nab confirms in a remarkable manner MM. Prillieux and Duchartre's statement (see *Academy*, vol. ii. p. 15), that plants absorb no moisture whatever in the state of vapour through their leaves. 7. Differences in the amount of fluid transpired by the upper and under side of leaves in the sun and in diffused daylight. Under both circumstances the amount was found to be much larger from the under than from the upper surface. 8. Rapidity of ascent of fluid in plants. From $4\frac{7}{12}$ in. in 10 minutes to $8\frac{1}{12}$ in. in 70 minutes. In all these experiments the plant operated on was the common cherry-laurel (*Prunus lauro-cerasus*), and the fluid used for testing the rapidity of ascent lithium citrate, the presence of a very minute quantity of which can be readily determined by the spectroscope.

Stipules of Magnolia.—In a paper read before the Academy of Natural Sciences of Philadelphia, Oct. 25, 1870, Mr. Thomas Meehan states his belief, the result of a series of structural observations, that the stipules of *Magnolia*, *Liriodendron* (the tulip-tree), and other genera of Magnoliaceæ, are in reality two lateral lobes of the leaf, which, by a peculiar process of adnation, became stipular sheaths after having been partially organized as leaf-blade. This would indicate the normal condition of the leaves of Magnoliaceæ to be ternate, and points to a still closer approximation between that order and Ranunculaceæ.

The Colours of Autumnal Foliage.—Mr. H. C. Sorby has a valuable paper on this subject in the January number of the *Quarterly Journal of Science*. The chemical substances which give rise to the varying tints of autumn he divides into five classes or genera:—1. *Chlorophyll*, or the green colouring matter, which is very rarely found pure, even in fresh leaves. It is insoluble in water, but soluble in alcohol or bisulphide of carbon, and the spectrum has a well-marked absorption-band in the red. 2. *Xanthophyll*, or the yellow colouring matter; this is insoluble in water, but soluble in alcohol and bisulphide of carbon; the spectrum shows absorption at the blue end. It is found in various fruits, flowers, and roots. 3. *Erythrophyll*, or the red colouring matter. There is strong absorption in the green part of the spectrum; the various kinds are usually soluble in water and dilute alcohol, but not in bisulphide of carbon. It is found in red flowers and leaves. 4. *Chrysophyll*, or the golden-yellow colours, soluble in water and dilute alcohol, but insoluble in bisulphide of carbon. 5. *Phaiophyll*, or the group of various browns; soluble in water, but not in bisulphide of carbon. These are mostly due to the oxidation of chrysophyll. Unfaded green leaves are coloured mainly by chlorophyll, but the tint is very much modified by xanthophyll, and by colours of the chrysophyll group. The various tints of autumnal foliage are produced by combinations of different members of the above groups; and Mr. Sorby gives the following scheme of their relative abundance:—During complete vitality and growth, we have different kinds of chlorophyll and chrysophyll producing more or less bright green; during low vitality and change, erythrophyll and xanthophyll make their appearance, producing more or less green-brown, red-scarlet, or bright orange-brown; while during death and decomposition phaiophyll and humus (brown-black) usurp their places, and gradually cause a uniform dull brown colour.

Geology.

Eozoön Canadense.—The question of the organic origin of this production, considered by the greater number of geologists as the most ancient fossil yet discovered, has been reopened by Mr. T. Mellard Reade, in *Nature*, Dec. 22. The writer asserts that structures called eozoönal have not yet been discovered in any unaltered rocks, while they are abundant in metamorphosed rocks; and argues, from this and other reasons, that Professors King and Rowney are right in holding the *Eozoön* to be a mere mineral structure occasioned by the metamorphism of the rock. In a subsequent number (Jan. 5), Dr. Carpenter replies, stating that the eozoönal structure is most characteristically displayed in those portions of the serpentine limestone of the Laurentian formation which have undergone the least metamorphic change, and reiterating the arguments derived from the structure itself, which have led him and most other geologists to consider the *Eozoön* as of indubitable organic origin.

Diamonds at the Cape.—It is announced in the *Graaff Reinet Herald* that one party of explorers has found 54 diamonds, one of 150 carats, another of 27, the others being smaller. Altogether their value is estimated at 150,000*l*. These estimates, however, usually undergo considerable modification when the diamonds arrive at the home-market.

Thermal Springs in Cambridgeshire.—These springs, described by Mr. Harmer, have been examined by the Rev. O. Fisher, F.G.S., of Harlton, Cambridge. They are situated in farmyards, and appear to derive their tepidity (65° Fahr. in winter, or even higher) from the warmth caused by the masses of farmyard manure hot and steaming which is stored up, 2 feet or more in depth, before being laid upon the land, above and around these shallows wells. This simple solution of the matter is important, as the presence of true thermal springs would be very difficult of explanation in Cambridgeshire.

Excavations at Portsmouth in the Lower Eocene Beds.—Some very extensive excavations are being made in beds of Eocene age at

Portsmouth for the purpose of forming a new dock. An examination of the beds by Messrs. Meyer and Evans, during the autumn months, has resulted in a large addition to the list of British Eocene Mollusca. Three new crustaceans have also been obtained and described by Mr. Woodward, one of which is referable to the *Corystidæ* and two to the *Portunidæ*. The genus *Palæocorystes* is found in the gault and chalk, and it is represented in our own seas by the living *Corystes*, or "masked crab." Its occurrence in the Eocene bridges over another gap between secondary and recent times. The Portunians will form a new genus, *Rhachisoma echinata*, and *R. bispinosa;* they are both armed with long hepatic spines.

Geological Bearings of Recent Deep-sea Soundings.—Under the above heading Mr. A. H. Green, of the Geological Survey, combats the views put forward by Prof. Wyville Thomson, and adopted by Dr. Carpenter, that we are now living in the cretaceous epoch. He maintains (in an article published in the *Geological Magazine* for January) that a mere similarity, or indeed identity, between certain low forms of life, common to the Atlantic mud and our chalk formation, ought not to be treated as conclusive. The older chalk swarms with *Ammonites*, *Scaphites*, *Baculites*, and *Belemnites*, not one of which will be found imbedded in the chalk of to-day. No marine mammals are found in the old chalk, but many, he thinks, will be preserved in the modern chalk. Some of the largest of the Pterodactyle family, besides *Ichthyosauri* and *Plesiosauri*, have left their bones to whiten in the old chalk mud, none of which survive to-day.

Mammoth in Belgium.—The great attraction of the geological portion of the St. Petersburg Museum consists in one entire gallery of mammoth remains, probably including many nearly entire skeletons, the bones of all of which are in a remarkably fresh state of preservation. Some years since (owing to the exertions of Sir Antonio Brady), an almost entire mammoth's skull with tusks, of colossal proportions, was obtained at the brick-pits at Ilford, in the Thames valley brick-earth, and now adorns the geological gallery of the British Museum. Since the appointment of M. Dupont to the post of keeper in the Brussels Museum, the almost entire skeleton of a mammoth, found some time since, but neither repaired nor mounted, has been diligently mended up bit by bit, till the Museum is now able to boast the possession of the best example of *Elephas primigenius* out of St. Petersburg. One is struck with the comparative height and slenderness of the mammoth's skeleton as compared with the modern elephant, and it seems probable that he was a more active and a lighter-built beast than the Asiatic or African species. It is to be hoped that the British Museum collection will, ere long, be enriched by the addition of a skeleton of the Siberian mammoth. The execution of the fortifications around Antwerp has led to the discovery, not only of elephants' and mastodons' remains, but a most wonderful series of cetacean bones. These are now arranged in a fine gallery in the Brussels Museum, which, under the direction of M. A. de Borre, bids fair to be one of the most attractive of Continental institutions.

Chemistry and Physics.

The Influence of Wind on Pressure.—At a recent meeting of the French Academy of Sciences, M. de Fonvielle called attention to a passage in the works of the celebrated philosopher, M. Mariotte, which throws some light on the reason of an increased pressure generally accompanying fair and a diminished pressure wet weather. Our dry winds, he explains, mostly come from the north or north-east, and hence, travelling from a colder region, have a tendency to descend, and therefore to increase the pressure of the atmosphere, or to cause the barometer to rise. Our rain-laden winds, on the other hand, generally come from the south or south-west, that is, from a warmer region, and consequently have a tendency to rise, or diminish the pressure, and thus cause the barometer to fall.

The Meteorite of Lodran.—Prof. Tschermak, the Keeper of the Imperial Mineral Collection at Vienna, has published (*Sitzungsberichte d. k. Akad. d. Wiss.* Bd. 61) a memoir on the physical and chemical characters of the aërolite which fell at Lodran, Mooltan, India, at 2 P.M. on the 1st October, 1868. The chondritic structure noticed by G. Rose in many meteorites was not observed in this stone, but within its shiny black crust was found a magma of silicious particles of so coarse a kind that the individual granules occasionally measured 2 mm. in diameter. The constituent minerals were carefully isolated before analysis, which showed this aërolite to be composed of—

Nickeliferous iron	32·5
Magnetic pyrites	7·4
Olivine	28·9
Bronzite, with some chromite and anorthite	31·2
	100·0

The nickeliferous iron contains nearly 13 per cent. of nickel, and, when etched, shows figures resembling those of the iron of Senegal. It constitutes a mesh enclosing the silicates, the crystals of olivine not unfrequently leaving a complete impress of their faces in this alloy. Associated with the last-mentioned substance, and occasionally entangled in the silicates, were fragments of magnetic pyrites; they showed no crystalline structure, and dissolved in acid with deposition of sulphur. The Lodran olivine is of a bluish-grey to Prussian-blue colour, and occurs in unusually well-developed crystals, which were found by Prof. von Lang to correspond in all respects with basaltic olivine. The fissures of many of the crystals are filled with a black mineral of a dendritic form; this is assumed to be chromite, and believed to be a secondary formation. By chemical examination the olivine was found to be made up of Mg_2SiO_4 and Fe_2SiO_4 in the ratio of 82 to 18. The bronzite is less perfectly crystallised, faces of but one zone being recognisable; they agreed, however, with those of the bronzite of the Breitenbach siderolite. On examining a microscopic section of this mineral, it was observed to enclose three distint bodies: colourless chondra of a doubly refracting mineral, which the crossed Nicols showed to be twinned, and which is probably a felspar; small round black particles, usually lying in groups, and presumed to be chromite; and fine hair-like bodies lying parallel to the cleavage edges; their nature could not be determined. Deducting the small amount of alumina and lime present, due possibly to the minerals enclosed in it, the bronzite is composed of $MgSiO_3$ and $FeSiO_3$ in the ratio of 78 to 22. It is remarkable that olivine and bronzite contain the same percentage of iron protoxide (12 per cent.). The chromite occurs in fine octahedra often 0·5 mm. in height.

Decomposition of Oxalic Acid.—M. Carles has lately conducted (*Compt. rendus*, 71, 226) a current of pure oxygen through a concentrated solution of oxalic acid, and then through two vessels containing baryta water. At ordinary temperatures no carbonic acid was evolved. When, however, the solution was heated to 100° in a water-bath, a precipitate of barium carbonate was formed. The decomposition of the oxalic acid is not a consequence of its oxidation, for the oxygen can be replaced by hydrogen or nitrogen with the same result. The oxalic acid splits up into carbonic and formic acids. The presence of the latter body is easily recognised by employing a washing bottle filled with silver nitrate. This decomposition more closely resembles the dissociation phenomena noticed by Gernez, and confutes the theory of Bizio, that the decomposition of oxalic acid in solution is brought about by atmospheric oxygen.

Sugar a Normal Constituent of Wine.—During the chemical examination of wines of every vintage and country (*Pol. Journ.* 196, 540), Dupré recognised the presence, in almost every case, of a certain amount of sugar, and was able after precipitation of the acids with lead oxide, and removal of the colour with animal charcoal, to identify the sugar by aid of Fehling's test. This confirms what Jellett had determined with the saccharometer. It seems no longer a matter for doubt that wines, even of the oldest vintages, contain some sugar.

Development of Ozone by Electrolysis.—During the electrolysis of bismuth nitrate, Böttger noticed (*Polyt. Notizbl.* xxv. 320) the production of an unusually large amount of ozone at the anode in addition to bismuth peroxide. Salts of lead and silver under like circumstances also form metallic peroxides, but no ozone.

Synthesis of Conine.—This, the first synthesis of a natural alkaloid, has been accomplished by Hugo Schiff, by the following method (*Reports of the Berlin Chemical Society*, 26th Dec. 1870, p. 946). When alcoholic ammonia is allowed to act on butyraldehyde at temperatures not above 100°, two bases are formed of the following constitution:—

$$\underbrace{C_{16}H_{29}NO}_{\text{Tetrabutyraldine.}} = 4C_4H_8O + NH_3 - 3H_2O$$

$$\underbrace{C_8H_{17}NO}_{\text{Dibutyraldine.}} = 2C_4H_8O + NH_3 - H_2O$$

The tetrabase is the chief product of the reaction, and the two bodies can be readily separated by means of the different solubilities of their chloroplatinates. By subjecting either the free base or its chloroplatinate to dry distillation, water is eliminated, and oily basic substances are formed with an intense suffocating odour. By the distillation of dibutyraldine, indifferent oily bodies are formed, then basic products of higher condensation, and finally a powerful alkaline base which exhibits all the characters of conine. It is formed according to the equation—

$$\underbrace{C_8H_{17}NO}_{\text{Dibutyraldine.}} = H_2O + \underbrace{C_8H_{15}N}_{\text{Conine.}}$$

History.

Prester John in Legend and History. [*Der Presbyter Johannes in Sage und Geschichte. Ein Beitrag zur Völker- und Kirchenhistorie und zur Heldendichtung des Mittelalters*, von Dr. Gustav Oppert.] Zweite verbesserte Auflage. Berlin: Springer, 1870.

The first edition of this work appeared in 1864, and was noticed by me at the time in the *Göttingische Gelehrt. Anz.* pp. 2063, ff. The principal object of Oppert's researches is to prove that there is no authority in original sources for the views of those who suppose Prester John to have been an African king of Abyssinia, or an Indian king, or the chief of a Tartar tribe, especially the Keraite chieftain Unkkhan (d. 1198). His own theory is that Prester John was none other than the Korkhan of Qarakhitay. *Korkhan* signifies "ruler of the country north of the desert of Gobi;" and in its prime the kingdom of Qarakhitay extended from Bokhara and Samarkand in the west as far as to that desert. The eastern boundary was formed by Tangut. According to this, it must have extended lengthwise for about 30 degrees, from 80° to 110° east longitude (Ferro). In the north it reached to the Ulugtag, the greater and lesser Altai Mountains; in the south, to Badakshan and the Muztag, that is to say, about from 35° to 48° north latitude. The rulers of this kingdom, which flourished from 1125 till nearly 1218, all bore the title of *Korkhan*, which Yeliutashé, the founder of the kingdom and dynasty, had received from his subjects. This prince is also the one to whom the oldest Western report about Prester John especially refers, that, namely, in Otto von Freisingen (d. 1158). In regard to the Christianity of the Qarakhitayans, the author has only succeeded in finding one passage containing circumstantial information. The Persian annalist Mirkhond mentions in his short sketch of the history of the Korkhans that the daughter of the last lawful ruler of Qarakhitay was a Christian, and had given her fellow believers all the support and assistance in her power. This notice might perhaps be considered to favour the conclusion that the princess's father, the Korkhan Kushluk, was also an adherent of the Christian faith. As for the name John, Oppert is of opinion that it is a corruption of the title Korkhan, the initial letter of which is frequently changed in West Turkish to *G*, and in the middle of words to *J*, so that Jorkhan would be a possible form of Korkhan. The title Jorkhan might then, according to Oppert, be easily transformed into the Syro-Hebraic name Juchanan, Jochanan, Jochan, and at that time the nations of the West derived their knowledge of Oriental history chiefly from the Syrians. Now, it is well known that the names Johannes, Johann, and John, are derived from Juchanan, and it cannot, he thinks, be denied that there is some resemblance between these forms of the name and the princely title Jorkhan. Professor Schott, of Berlin, one of the principal authorities on the languages of Eastern Asia, has also recently given the support of his name to this derivation.

The title Presbyter or Prester remains to be explained, and on this subject the author observes:—

"It is not easy to indicate the precise connection between the Korkhan, lord of the Qarakhitayans, and the priestly office. On the other hand, it should be remembered that, amongst the Nestorians, it was rather usual to assume it; that the Franciscan Rubruquis testifies that in Central Asia nearly all the males belonging to the Nestorian sect had received ordination as priests, and that an actual descendant of Presbyter John received, as we have seen, minor orders at the hand of John of Monte Corvino, and served in his chapel at high mass" (towards the year 1293).

These are the principal results of Oppert's investigations, and he has maintained them substantially unaltered in the edition before us, in which only a few points of detail have been corrected; as for instance, instead of treating the Travels of Sindbad as the source of the wonderful letters of Prester John, Oppert now prefers to connect them with the Alexander legends. An essay, "On the Origin of the Parcival and Grail Legends," has also been omitted, and only part of it reproduced under the title, "The Grail and the Knights of the Grail in the Poems of Eschenbach." In this Oppert maintains as before, and endeavours to find fresh grounds for the opinion, that the Coral legends have an intimate connection with the Grail myths. He also shows clearly that in Wolfram's glorification of the order of the *Templeisen* of Salvaterra, he had in his mind the gallant contemporary order of Salvatierra (Calatrava), which, like the order of Knights Templar, was founded on the Cistercian rule. Space forbids us to dwell at length on all the parts of this very attractive work, but it may be observed, in reference to p. 9, that Barros, Dec. III. l. iv. c. 1, pp. 359-365, had already called attention to the confusion of the Asiatic Prester John with the king of Abyssinia. The careful index appended to this new edition is particularly welcome, but, on the other hand, a considerable number of annoying misprints have been overlooked; thus p. 36, l. 5 from bottom, there is *tonaliæ* for *tovalie* (meant for the Italian *tovaglie*), &c. &c.

Felix Liebrecht.

Philology.

A Shakespearian Grammar; an Attempt to Illustrate some of the Differences between Elizabethan and Modern English. For the Use of Schools. By E. A. Abbott, M.A., Head Master of the City of London School, formerly Fellow of St. John's College, Cambridge. Third Edition. London: Macmillan and Co., 1870.

There is a wide difference between the first and third editions of this work. In his first edition, Mr. Abbott was too cautious, and left many things but half explained. His book showed great industry, but no very firm grasp of the subject, and not sufficient investigation in the right direction, viz. in the observation of the older forms of our language. In this third edition, however, which is called a "revised and enlarged edition," we observe an immense advance. The explanations are fuller, clearer, and more precise. He has, in the interval, more firmly seized the true principle, viz. that the author who would explain various grammatical usages with certainty *must* refer frequently to the older monuments of the language with which he is dealing. He refers freely to Mätzner's *Englische Grammatik*, and to Sir F. Madden's edition of Layamon, and he could hardly have done better. The collection of examples in Mätzner's Grammar, all thoroughly well arranged, is astonishingly copious; the whole field of English literature has been carefully traversed, and so many examples selected that on one and the same page we frequently find quotations from the Towneley Mysteries, Piers the Plowman, Macaulay, Shakespeare, Otway, Chaucer, and Charles Dickens. When the member of the Philological Society who is said to be trans-

lating Mätzner's work shall have completed his great task, we may reasonably hope that to go astray concerning points of English grammar will no longer be tolerated. Then, again, how important a book is Layamon! Written in the time of King John, existing in two excellent MSS., printed (and this is no small matter) by a scrupulously exact and entirely competent editor, it is one of the safest guides we have for exhibiting the manner in which the Early English of "Anglo-Saxon" times gradually changed into the Early English of the 14th century. Mr. Abbott has used these books to good purpose, and refers to his use of them most sensibly in his preface, p. xxiv, though he should have omitted the apology in the fourth line.

With regard to Shakespeare, Mr. Abbott exhibits the results of an astonishing and almost appalling industry, of which the reader reaps the full benefit. The references, the mere enumeration of which fills forty-eight pages closely printed in quadruple columns, tell us not only in what act and scene any particular word occurs, but *in what line;* so that, by using the Globe edition, we find our place at once, instead of having to peruse the entire scene with a large chance of missing the particular *but* or *and* that is under discussion. Particular attention is paid to all the important particles on which so much frequently depends. The articles, pronouns, prepositions, and conjunctions, are as much attended to as are the auxiliary verbs and the forms of the subjunctive mood; besides which, we have examples of elliptical expressions, double negatives, implied nominatives, idioms, compounds, prefixes, affixes, and syntactical arrangements; whilst, for those who are not attracted by these things, there is a most interesting chapter on prosody, bringing out some very curious accents, pauses, and peculiarities of pronunciation. The whole work is remarkable for painstaking and general accuracy, and an obviously sincere desire of attaining to the exact truth. It is at once a trustworthy and perhaps the sole guide to a knowledge of Shakespeare's grammar.

To take an instance. We greatly prefer Mr. Abbott's explanation of the phrase *many a man* to the explanation in Archbishop Trench's *English Past and Present.* The archbishop takes *many a man* to be a corruption of *many of men*, and says there is no doubt about it. But this is just one of those uncritical assumptions where phrases like "no doubt" are employed to gloss over the fact that the proof cannot easily be produced. Not one such instance is offered except the casual one where Wiclif translates the Latin *multos sanctorum* by *manye of seintis* (Acts xxvi. 10). Mr. Abbott (p. 60) refers us to Layamon, where we actually find the *a* declined, as in "monianes cunnes," literally, *of many a kind.* This is conclusive. The *a* is here the article, and not the preposition *of.* Or, in Mr. Abbott's words, "the article or numeral adjective *an* is declined like an adjective, while *moni* is not. The inference is, that *moni* is used adverbially. In the same way the Germans say *mancher* (adj.) *Mann*, but *manch* (adv.) *ein Mann; ein solcher* (adj.) *Mann*, but *solch* (adv.) *ein Mann.* In A.-S. the idiom was *many man*, not *many a man.*" In fact, the use of *many a* in Old English is not confined to the singular number; it is also found with plurals, especially where the plural noun *precedes* the phrase *many a* or *many one* in the sentence. Clear examples of this are the following:—

> "Than telle I hem ensamples *many oon*"
> (Chaucer, *C. T.* 13,850);
>
> "After tho bokes which of it men fynde,
> Wher this historie preuyd *manion*"
> (*Romans of Partenay*, ed. Skeat, pr. 169);

which means, "according to those books which men find concerning it, where many one (? whether of *books* or of *men*) proved this history."

But sometimes the plural noun was dropped, and *many one* used as a plural without a noun, as—

> "And leten the othre to liue gon,
> Of hem be tudered *manigon*"
> (*Genesis*, ed. Morris, l. 630);

i. e. "and let the others escape alive; of them are many engendered."

Exactly similar is the phrase in Psalm iii. in the prayer-book version, "*Many one* there *be;*" where the use of *be* shows *many one* to be plural, as in the last example. The Bible version avoids the difficulty by simply dropping *one*, and reads, "Many there be;" which is both better and simpler, and, according to the *oldest* usage, more correct. In late English, we meet with the pleonastic form *many a one*, which is etymologically equivalent to *many one one.*

But Mr. Abbot is certainly in error in adding "So after the adverb *ofte*, we have *a day* in—

> "Ful ofte a day he swelde and seyde alas!"
> Chaucer, *Knighte's Tale*, 498.

For this example is not to the purpose. "Ofte a day" means *often in the day;* the *a* being here, as so frequently elsewhere, a contraction of *on.* See a similar passage in *William of Palerne* (ed. Skeat), l. 610—

> "& *ofter* than ten times hit taketh me *a daye*,
> And nine times *on the night*, nought ones lesse."

The error of putting an apostrophe in *Knighte's* we are disposed to attribute to the printer; it is of course superfluous to insert an apostrophe to denote the absence of an *e* when the *e* is, as a matter of fact, present. One short rule may here suffice, viz. that apostrophes never occur in Early English; a fact of which Chatterton, among others, was unaware.

We feel that the subject of English grammar in general, or even of Shakespearian grammar in particular, is too vast to be discussed within reasonable limits. Even with regard to Mr. Abbott's treatment of it, we have had space to criticise but one instance of a peculiar usage. We can only recommend Mr. Abbott's book generally, without endorsing the complete correctness of every article in it. It would not be difficult to point out a few errors of more or less importance. What, for instance, is the advantage of inserting such a sentence as this on the use of the word *and?* Mr. Abbott says, "It is common in ballads, and very nearly redundant:—

> "The Perse owt of Northumberlande,
> *And* a vow to God made he."—*Percy* (Mätzner).

In this case, Mr. Furnivall, we are told, conjectures *and a vowe* to be a mistake for *an avow, avow* being the old form of the word *vow.* This is right, but there is no room for conjecture. Any one who reads the ballad of *Chevy Chace through* will meet with the word *avow* again, viz. in the line—

> "As our noble kyng made his *avowe.*"

This may serve as a caution against rushing to conclusions. The error is not so much Mr. Abbott's as Mätzner's; and not so much Mätzner's as Richard Sheale's, whose transcript is our only authority. The expression "common in ballads" may probably be taken to mean that a few such corrupt instances may be found.

But we may, to some extent, sum up the chief difference between Elizabethan and Modern English in one word, viz. *freedom.* In the days of Queen Bess, authors were the masters, not the slaves, of words. If they wanted to use a substantive as a verb, or an adjective as an adverb, they did so without the slightest hesitation. If they wanted to alter the number of syllables in a past participle, they made the past tense do duty for it, just as Lord Byron has done in the lines—

> "And the idols are *broke* in the temple of Baal;
> And the might of the Gentile, *unsmote* by the sword," &c.

All this is well brought out in Mr. Abbott's "Introduction," and we quite agree with his opinion that the primary objects of the Elizabethan poets were *clearness* and *force*. Irregular grammar is often perfectly intelligible and expressive; the very defiance of rule sometimes draws attention to particular words, and lends vigour to the phrase. Such bold licenses are frequently successful in their effect, and this alone can justify them. The investigation of them can never fail to be very instructive. WALTER W. SKEAT.

Elucidations of the Student's Greek Grammar, by Prof. Curtius. From the German, with the Author's sanction, by Evelyn Abbott. London: John Murray, 1870.

AN English translation of Professor Curtius' *Erläuterungen zu meiner Griechischen Schulgrammatik* will be welcome to all who have accustomed themselves to use the same scholar's *Grammar of the Greek Language*, translated and edited by Dr. W. Smith. It might, however, have been an advantage if the two books had been worked up into one. The greater portion of the *Erläuterungen* might have served as a very useful introduction to the grammar, and the remaining paragraphs could well have been distributed among the different chapters, so as to throw light in their proper place on any points that seemed to require elucidation. In later editions of the grammar such an arrangement will be a decided advantage.

Professor Georg Curtius has done more than any living scholar for utilising the results of comparative philology in the interest of classical studies, and he has made the University of Leipzig the very centre of philological life in Germany. His school marks, in fact, a decided advance beyond Bopp. Instead of merely collecting the coincidences, real or apparent, in the grammatical structure of cognate languages, such as Sanskrit, Zend, Armenian, Greek, Latin, Gothic, Irish, and Palæo-Slavonic, he has drawn particular attention to the importance of studying each individual language by the light derived from a comparative study of the whole family of speech to which it belongs. The results obtained by this new method have been most valuable, and though Professor Curtius, as standing between two parties, has had to bear the hostility both of the old school of classical and the new school of comparative scholars, he has not betrayed the true interests of either. He has held his own against the best classical scholars of the day, and even the invectives of such a veteran as Professor Pott have not shaken his strong position. In fact he has but confirmed the old rule that the best abused is generally the best man, and his Greek grammar, in spite of all opposition it had to encounter, is at present the most popular grammar in Germany. Its success in England, owing to various circumstances, may be slower, but that it will carry the day in the end, there can be little doubt. Mr. Abbott's translation of the *Elucidations* is very creditable, and shows not only an accurate knowledge of German, but also a familiarity with the principles of comparative philology. A few accidents have happened. On p. 147 we read: "But a further division of the material is hardly incompatible with the requirements of instruction." *Schwer vereinbar* means the very contrary, viz. "it is hardly compatible." Some hints should have been given as to the pronunciation of vowels. On p. 22, we read: "*αι* and *ει* were pronounced in some districts as *ä* and *i*." On p. 23: "Hermann recommends a pronunciation of *αι* midway between *a* and *e*." In each case the vowels *ä*, *i*, *a*, and *e*, must be pronounced as in German, not as in English.

With regard to the original, there is little to remark. It strikes one as strange that so many things which would seem to have long been placed beyond the reach of controversy should still require to be proved and defended. That the stem of neuters like γένος is γένος or γένες would seem to be as certain as that the genitive of *mensa* is *mensae*. Yet "even to the most recent times," Professor Curtius tells us, "these simple stems in ς, *e.g.* γένες (nom. γένος) are ignored by Rost and Krüger." In this respect English are really in advance of German school grammars.

On p. 42, Professor Curtius says: "The most important results of the inquiry which bring the theory of spirants into a consistent whole for the first time are the following: σσ arises only out of a hard mute or aspirate (τ, θ, κ, χ)." This is quite correct, but it required some elucidation. Corresponding to μέσσος or μέσος we have Sk. *madhya*, Lat. *medius*, Goth. *midjis;* and though it is perfectly true that *madhya* would in Greek appear as μεθιος yet such a form lies beyond the horizon of Greek, and is unknown to Greek scholars.

On p. 10, we are told, *υια*, the fem. of the past perf. act., "has arisen out of *Fοτια*, τ having been weakened to σ and then dropped." If this view is to be maintained, and we are to believe that the change from *Fοτια* to *υια* took place on Greek ground, it will be neccesary to show that *Fo* can in Greek become *υ*, as *va* in Sanskrit becomes *u*. On p. 81, such a change is supported by *κυν* instead of *κυον*, and by *ὕπνός* corresponding to Sanskrit *svapna*. Neither case, however, is quite to the point, for *κυν*, like Sanskrit *śun*, is really a parallel form of *κυον*, Sk. *śvan*, and possibly even more primitive; while in the case of *ὕπνος* there is nothing to prove that its typical form was *svapna*, and not *supna*, or that such a form as *σFοπνος* ever passed Greek lips. I prefer to start with *us-â* as the typical form, which in Sanskrit becomes *ush-â*, in Old-Slavonic *vŭsh-ĭ*, in Greek *υ-ι-α*.

On p. 174, *Bahuvrîhi*, the technical name of possessive compounds in Sanskrit, is rendered by "much rice," or "rich in rice." This is not quite right. *Bahuvrîhi* means "possessed of much rice," πολυ-όρυζος.

On p. 176, it seems at least doubtful whether a compound like ἐλκε-χίτων could strictly be classed with δρυ-τόμος, and ἐπιχαίρε-κακὸς with θεο-είκελος. MAX MÜLLER.

THE ACADEMY.

"Inter silvas Academi quærere verum."

Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance.
The Editor of The Academy *cannot undertake to return communications which are not asked for.*
The next number will be published on Wednesday, March 1, and advertisements should be sent in by February 24.

NOTICE.

The Academy *will in future appear regularly on the 1st and 15th of every month.*

General Literature.

The Works of Alexander Pope. New Edition, including several hundred unpublished Letters, and other new materials, collected in part by the late Rt. Hon. John Wilson Croker. With Introduction and Notes, by Rev. Whitwell Elwin. Vols. I. and II. Murray, 1871.

This edition has been twenty years or more in preparing. The time seems long for mere editorial work. But when we examine the mass of minute particulars that have to be sifted, and the mystery in which in this instance all the facts are involved, and when we find that the editor has resolutely grappled with his task, and subjected the whole to a thorough and searching investigation, we do not think there has been undue delay. We should conjecture too, that to Mr. Elwin the labour has been a most irksome one, and that there have been long periods in which he has laid it aside in sheer disgust. It is a standing accusation against editors that they grow too fond of their subject by dwelling upon it, and that the tone of biography becomes panegyrical. In Mr. Elwin's case the process has been the opposite. Weariness of a self-imposed task has grown into dislike of the subject of it. No doubt the investigations he has conducted have been a wearisome and unrewarding labour. It required some passion to sustain the effort. In Mr. Elwin's case this stimulus has been supplied by antipathy. His has been a labour of hate. He pursues Pope, his actions, and his utterances, with an unrelenting animosity, which leaves him neither virtue as a man nor merit as a writer. When we lay down Mr. Elwin's indictment, we cannot help asking the question, "Why reprint Pope at all? The sooner the nonsensical rhymes of such a scoundrel are forgotten, the better."

The first volume comprises, besides the juvenile poems, an introduction of 140 pages by the editor. The introduction, though prefixed to the poems, relates wholly to the letters, which are to follow in later volumes. In it is unravelled, with astonishing patience, the web of trickery which Pope wove round each successive volume of his correspondence. The three motives which at any time influenced Pope in publishing, were vanity, spleen, and the desire of deceiving. In the publication of 1729 he gratified all these base passions at once. He contrasted his own performances at sixteen favourably with those of his dead friend Wycherley at seventy; he duped Lord Oxford, and damaged Theobald. In the P. T. plot which accompanied the next publication of letters in 1735, he tricked Curll, and had the audacity to make a tool of the House of Lords. The worst case of all is the volume of 1741, when he passed a cheat upon his lifelong friend and intimate, Swift. He tampered with the substance of the letters he published, and that not merely to the extent of omitting, or even altering, but did not scruple to make himself say the direct contrary of what he had said. A most gross instance of this is when he writes to Swift: "Lord Bolingbroke is above trifling; when he writes of anything in this world, he is more than mortal; if ever he trifles, it must be when he turns a divine." Thus stands the passage in the *printed* letter. The copy, still preserved at Longleat, has—"Lord Bolingbroke is above trifling; he is grown a great divine." Pope, when he printed the letter in 1741, reversed the language of the original passage, that he might seem to have disapproved the Deism of Bolingbroke before the publication of Crousaz's attack upon the *Essay on Man*.

His habit of falsehood is such that he cannot state truly the dates at which he composed his own poems. He asserts that he wrote the *Pastorals* at the age of sixteen. There is no evidence of this except his own assertion, and he cannot be believed when his vanity is interested. He wished to be thought a precocious genius. It can be shown that the *Pastorals* were not exhibited to his friends till he was past seventeen. When they came out, he pretended he had not designed them for the press, and wrote disingenuously to Cromwell to that effect. "He was in his twenty-first year, an age at which frankness commonly preponderates, and he already abounded in the ostentatious profession of sentiments he did not entertain." The farce of indifference, thus early begun, he continued to enact to the end of his days. "His whole existence was passed in painstaking, almost drudging, authorship; he left no means untried, dishonest as well as fair, to extend his reputation, and he pursued every person with inveterate malice who presumed to question his poetical supremacy. In spite of his boasted apathy, there cannot be found in the annals of the irritable race a more anxious, jealous, intriguing candidate for fame." The new and terrible force with which Mr. Elwin has marshalled the evidence on which these charges rest seems to leave no possibility of escape or palliation. Genius is no extenuation of rascality.

Still the works of genius survive. Though we must learn to loathe and despise the author, his writings need not lose their charm. This is not so. His letters are laboured, artificial, insincere, garbled, tacked to false dates and false addresses. His version of Chaucer "has preserved none of the humour of the original, but is a dead insipid dissertation." In the *Temple of Fame* the romance which constitutes the charm of the original is replaced by a scene of frigid tameness. As for the *Pastorals*, "no ideas can have less to recommend them than the hollow rhapsodies of the *Pastorals*, which are at once obvious and absurd." The *Essay on Criticism* is distinguished by a want of good sense in the critical canons; it is "very superficial," full of contradictions, and "its minor positions are glaringly erroneous." Perhaps in these juvenile poems we ought not to ask for matter, but to be satisfied with the poet's masterly skill in versification. There we should be wrong again. Mr. Elwin agrees with those who think that Pope's metre is prone to a cloying mannerism. "Much of the verse is of a low order; the phraseology is frequently mean and slovenly, the construction inverted and ungrammatical, the ellipses harsh, the expletives feeble, the metre inharmonious, the rhymes imperfect." Pope once inserted "lane" as rhyme to "name" in order to disguise his authorship of a poem which he published anonymously. The disguise would have been greater, his editor observes, if the rhymes had been good. A liberal admixture of faulty rhymes is a common characteristic of Pope.

The most serious count in the long indictment of which the editor's comment consists is that connected with the *Essay on Man*. This poem Mr. Elwin seems to regard as a deliberate attack on Christianity and religion in general, jointly contrived by Pope and Bolingbroke. Mr. Elwin's

composure entirely deserts him at the very mention of the name of Bolingbroke, "a scurrilous deist, whose writings are stuffed with frenzied invectives against the faith and hope of the vast majority of the English people." He assumes the most exaggerated version (Dr. Hugh Blair's) of Lord Bathurst's assertion that Lord Bolingbroke composed the *Essay on Man* in prose, and that Pope put it into verse. Even Johnson, little favourable either to deists or to Pope, admitted that there must be some mistake there. Proceeding upon this basis, the editor institutes a minute examination of the argument of the *Essay*, and finds it, so far as it is not a mass of confusion and contradictions, a system of selfism in morals, and negation in religion. The errors of the text, however, are provided with an antidote in an elaborate refutation, point by point, and a statement of the true views both of ethics and religion, as conceived by Mr. Elwin himself.

With the most sincere respect for the judgment and literary taste of the editor, and hearty recognition of the conscientious pains and research he has bestowed on his work, we must state our conviction that he has here adopted an erroneous hypothesis. We believe, on the contrary, the ordinary account of the origin and character of the *Essay on Man* to be the true one. Pope, in an evil hour, was ambitious of entering the higher sphere of philosophical, or what passed then for philosophical, speculation. He felt that, if he confined himself, as hitherto, to personal themes, he could not be the first poet of the age. He had no speculative interests, no speculative capacity, but he was drawn into the speculative furor of the time by his literary ambition. He took up with any ideas that seemed to him capable of poetic treatment. Being bred a Catholic, he had that general scepticism as to philosophic truth which is generated by the habit of regarding religion as resting on authority. How far he was obliged to Bolingbroke for suggestions in conversation, we cannot tell—no doubt largely. But how far he was assisted by him in writing, we think we know exactly, if we are right in conjecturing that the "seven or eight sheets" supplied by Bolingbroke are contained in the Fragments, &c., now printed in vols. v. and viii. of Bolingbroke's *Works*, and that these memoranda are the MS. seen by Lord Bathurst. However this may be, we have no doubt at all that Pope intended the poem to be on the side of natural religion. From want of understanding, and want of interest in the subject, he so expressed himself as to give a handle to the theological critics, of whom Crousaz made himself the mouthpiece. Here came in Warburton. Warburton availed himself in defending Pope of the same ambiguities and inconsistencies which Crousaz had turned against him. "The *Essay*," says De Quincey, "is a Hebrew word with the vowel-points omitted; and Warburton supplies one set of vowels, while Crousaz with equal right supplies a contradictory set." It is quite true that Warburton strained and twisted passages to mean what it is apparent the poet never meant. But however grotesque may be his distortion of particular lines, he has this justification, whatever it is worth, that the poet's *general* sense was with Warburton, not with Crousaz.

Warburton's commentary was intended only to serve a temporary controversial purpose. It has no critical value whatever, and therefore no place in a classical edition of Pope. We must express our regret that the present judicious editor should have thought it necessary to reprint the "whole of the bulky excrescence," as he justly calls it. Still less can we understand the motive which has prompted him to load his pages with a lengthy controversial refutation of the doctrines which he ascribes to Pope. He follows him paragraph by paragraph, and takes pains first to prove that Pope's meaning is a bad one, then offers a refutation, and concludes with an antidote by laying down the sound view of the question. His anxiety to refute is such, that he more than once stays to controvert lines which Pope has rejected from the final text, and which only appeared in the first edition, or in the rough copy. Sometimes it almost seems as if the zeal of controversy hurried the editor into affixing a sense to Pope's words which they will not bear, in order to found upon them a controversial reply: *e. g.* every one remembers the passage (*Ess.* ii. 275):—

> "Behold the child, by nature's kindly law
> Pleas'd with a rattle, tickl'd with a straw;
> Some livelier plaything gives his youth delight,
> A little louder, but as empty quite;
> Scarfs, garters, gold, amuse his riper stage,
> And beads and pray'r-books are the toys of age."

The thought here, apart from the beauty of the language, may not be very new or very profound. It is indeed rather trite than otherwise. We see in it nothing more than a depreciation of the overeagerness of human pursuit, or the vanity of human wishes; a sentiment sought to be produced in the reader by suggesting an analogy between the toys of childhood and the ambitions of mature life. The stages of the transition are surely a fact of which society in Pope's time offered, as it does still, daily confirmation. Especially the last stage, when ambition, sated or balked, is superseded by devoteeism, was a marked feature of the French society of the close of Louis XIV.'s reign. Boileau has not failed to point many a sarcasm at the *dévots* of his age. His description of the devotee in his 11th satire is as much stronger than Pope's lines, as it is inferior to them in poetical expression. Yet in Pope's words Mr. Elwin reads the doctrine of the inutility of prayer, and considers them designed to "ridicule religious aspirations."

Again, Bolingbroke is known to have held the opinion espoused by the present Dean of St. Paul's in his eloquent *Bampton Lectures*, that the moral attributes of God differ in kind from ours. Warburton, right for once, attacked Bolingbroke on this point. We quite agree with Warburton and Mr. Elwin in condemning a doctrine which destroys natural religion at its roots, but we fail to see an enunciation of the doctrine in the couplet with which the 2nd ep. of the *Essay on Man* opens:—

> "Know then thyself, presume not God to scan,
> The proper study of mankind is man."

The sense of the prohibition is to be gathered from the context. The line, as the word "then" shows, is an inference from the preceding epistle. The small part which we can see of the "stupendous whole," though enough to lead us to the general conclusion that "whatever is is right," is not enough to give us a comprehension of the whole scheme of Providence.

In the interests of literature we earnestly deprecate this introduction of theological polemic into an edition of Pope. If Pope is worth editing at all, it is as a classic, *i. e.* a document of a past age. The didactic effect of the poem was of little consequence in the author's own eyes. It is of none at all in ours. What would be thought of an editor who treated Lucretius as a controversial pamphlet, and who accompanied the poem with a refutation of its doctrines larger in bulk than the text itself?

Mark Pattison.

The Divina Commedia of Dante, translated into English Verse by James Ford, A.M., Prebendary of Exeter. London: Smith, Elder, and Co., 1870.

If any proof were needed of the interest which for some time past has been felt in England for Dante's great poem, it would be found in the numerous translations that have

appeared in our language in the course of a few years. The difficulties in the way of translating the *Divine Comedy* are extremely great; greater, in all probability, than what are presented by any other epic poem. The extraordinary range and mysterious character of the subject, the intense vividness with which scenes are conceived, and portrayed in appropriate language, the elaborately artistic nature of the poem throughout, the fire and the pathos which the author has succeeded in infusing into his expressions, and above all the concentration of thought, and the closely fitting structure of pregnant words and clauses, which cause his sentences to resemble the massive formation of a cyclopean wall—are characteristics which might well deter a person from attempting to reproduce it in another language. And yet, in spite of these difficulties, the English translations have been eminently successful, and that too in very different styles. Until twenty years ago the well-known one of Cary, in continuous Miltonian blank verse, which dates from early in the present century, held almost undisputed sway; and so great is its perfection as a work of art that, whatever competitors it may now have, we should be sorry to see it driven out of the field. Since that time have appeared (to mention only the more important) Dr. Carlyle's prose translation, a more arduous task than might at first sight appear, owing to the difficulty of maintaining a sufficient elevation without the help of metre, and at the same time avoiding a turgid style; that of Mr. Cayley, with the metre and rhyme of the original complete; and lastly Longfellow's, in blank verse, but following the Italian line by line. Of these we venture to consider Mr. Cayley's the cleverest, because he has attempted so much more than the others, and has achieved a very considerable amount of success; though at the same time it is certainly not the most popular, for both in England and Germany the blank verse renderings have been much more generally read than those that have had a more ambitious aim, partly, no doubt, in consequence of the greater facility and simplicity which the absence of rhyme allows. Still, the form of the original is so integral a part of the poem that the ultimate goal of the translator cannot be considered to be reached, unless this also is preserved. It is a proof of the high merits of Mr. Longfellow's work that, in turning to it from a rhymed translation, the luminous clearness of his diction, the forcible and somewhat archaic simplicity of his expressions, and the evenly sustained dignity of his rendering, cause the reader hardly to feel the want of rhyme. In fact, with that exception, he has reproduced Dante in every particular.

To these versions we have now to add that of Mr. Ford, and it is not unworthy to rank among them. Here the *terza rima* has been maintained throughout, and the fact that this has been skilfully accomplished is in itself a claim to high praise. As a set-off against this, we must expect to find that the style is occasionally stiff and the construction involved, but in a language so barren of rhymes as English this is almost unavoidable. If, again, the meaning is sometimes obscure, we can hardly help regarding this as venial, since this source of difficulty is found from time to time in the poem itself, and is certainly not wanting in some of the best original sonnets of the present day. Here and there, indeed, we meet with passages where the translation is either wrong or unintelligible: in the description of the first appearance of Beatrice in the *Purgatorio* (canto xxx.) the lines—

> " Donna m' apparve, sotto verde manto,
> Vestita di color di fiamma viva;"

cannot rightly be translated—

> " Appear'd a Lady, 'neath a mantle green;
> Like the live flame, that tinged her vesture, red:—"

and, similarly, in the preceding canto, the passage—

> " Non che Roma di carro cosi bello
> Rallegrasse Affricano o vero Augusto;
> Ma quel del Sol saria pover con ello:—"

is made unintelligible by the following rendering—

> " 'Tis not, that Rome never rejoic'd, of old,
> Scipio, or Cæsar, with so bright a car,
> That of the sun to this looked poor and cold."

But these are rare instances, and on the whole Mr. Ford's translation is as much distinguished by its accuracy as by its easy, pleasant flow. Occasionally, notwithstanding, the fetters in which he moves, he succeeds in giving the author's meaning with more spirit even than Longfellow. Take, for instance, a passage in the description of the Church Triumphant (*Par.* xxx.), in which Dante gives evidence of the same delight in the observation of the details of nature which we trace in the foregrounds of the early Italian masters:—

> " E come clivo in acqua di suo imo
> Si specchia quasi per vedersi adorno,
> Quanto (*al.* quando) è nel verde e ne' fioretti opimo:"
>
> " And as a hill in water at its base
> Mirrors itself, as if to see its beauty
> When affluent most in verdure and in flowers:"
> (Longfellow, p. 592.)
>
> " And as a cliff, fast by some water clear,
> The glassy slope looks down, itself to trace—
> How rich the verdure, rich the flowers appear:"
> (Ford, p. 407.)

Here, though "cliff" and "glassy slope" are not exactly the original, yet we feel that the picture which Dante intended to call up is more accurately given than in the more literal translation. On the other hand, where much depends on the position of the words, as in the following passage from the same canto, the blank verse rendering at once evinces its superiority, to which we must add that Mr. Ford has in part mistaken the meaning of the second line:—

> " Luce intellettual piena d' amore,
> Amor di vero ben pien di letizia,
> Letizia che trascende ogni dolzore:"
>
> " Light intellectual replete with love,
> Love of true good replete with ecstasy,
> Ecstasy that transcendeth every sweetness:"
> (Longfellow, p. 590.)
>
> " Light of the mind, replete with love, is here,
> Love of that Good, that every joy supplies;
> Joy, of all joys, most exquisite and dear."
> (Ford, p. 405.)

But it is with Mr. Cayley that Mr. Ford ought most rightly to be compared, as they have both attempted the *terza rima*. Of these two it appears to us that Mr. Ford has the advantage of a greater command of rhyme, and generally his verse has a smoother and easier flow; but Mr. Cayley, though somewhat the stiffer of the two, is more accurate, and certainly more pointed—a feature of the utmost importance in translating so forcible and so graphic a poet as Dante, especially in the more sublime passages. We would refer any one who desires to verify this to their respective translations of Dante's "Address to Ser Brunetto" (*Inf.* xv.), the "Story of Ulysses" (*Inf.* xxvi.), "Ugolino" (*Inf.* xxxiii.), the "Vision of Leah and Rachel" (*Purg.* xxvii.). We should therefore give the palm to Mr. Cayley, though at the same time recognising the great merits of the translation before us. As a favourable specimen of Mr. Ford's ordinary work we may take the following from the *Purgatorio* (canto iii.), where the spirits are amazed at seeing the shadow cast by Dante's body:—

> " Forth from the fold as troop a flock of sheep,
> By one, two, three; while th' others still stand by,
> Timid, and low aground their faces keep,
> And with the leader all at once comply;

Stop, if she stops, quick huddling to her side,
Simple, and still; nor know the reason why;
So saw I those advance, who foremost guide
The movements of that life-predestin'd flock,
In mien so chaste, in step so dignified."

It may, perhaps, be thought that if Mr. Cayley's translation is superior to that of Mr. Ford, the publication of the latter is superfluous; but this objection has been answered by anticipation in the very modest preface to this volume. After speaking of the arduous and hazardous nature of his undertaking, and the improbability that any perfect success can in the ordinary course of things be attained, except after repeated endeavours, Mr. Ford adds:—"If this be so, then neither this nor any translation subsequent to it can fairly be regarded as superfluous and uncalled for; still less as presuming, and derogatory to those that have preceded it."

H. F. Tozer.

ON THE SITE OF A MULBERRY-TREE;
Planted by Wm. Shakespeare; felled by the Rev. F. Gastrell.

This tree, here fall'n, no common birth or death
Shared with its kind. The world's enfranchised son,
Who found the trees of Life and Knowledge one,
Here set it, frailer than his laurel-wreath.
Shall not the wretch whose hand it fell beneath
Rank also singly—the supreme unhung?
Lo! Sheppard, Turpin, pleading with black tongue
This viler thief's unsuffocated breath!

We'll search thy glossary, Shakespeare! whence almost,
And whence alone, some name shall be reveal'd
For this deaf drudge, to whom no length of ears
Sufficed to catch the music of the spheres;
Whose soul is carrion now,—too mean to yield
Some tailor's ninth allotment of a ghost.

Stratford-on-Avon. D. G. Rossetti.

LITERARY NOTES.

By the death of the Minister of Public Instruction, Baron Joseph Eötvös, of Vásáros-Namény, Hungarian literature has lost one of its most distinguished representatives. He was born at Buda, September 3rd, 1813. On finishing his legal studies at the University of Pesth, in 1831, he served first in the administration of a Hungarian county, and afterwards in the Hungarian Chancery at Vienna. During this time he wrote two or three original dramas, and translated Goethe's *Götz von Berlichingen*. From 1837 to 1848 he wrote pamphlets on the improvement of prisons, the emancipation of the Jews, and similar measures of reform, and was especially distinguished as the champion of a parliamentary and ministerial form of government, as opposed to the system of municipal autonomy advocated by M. Kossuth, and the far larger portion of the liberal party. In company with his friend, the historian of Hungary, M. Ladislaus Szalay, he started the *Budapesti Szemle*, in imitation of the English quarterly reviews, and took part in the management of the influential newspaper, *Pesti Hirlap*, when in 1843 it passed out of M. Kossuth's hands. His literary fame in his own country was, however, first definitely established by *The Carthusian*, a sentimental romance of the school of Byron and Châteaubriand, which procured him in 1841 his election as honorary member of the Hungarian Academy. He wrote two other novels, illustrating and enforcing his political views—*The Village Notary*, satirizing the county administration of that time, and *Hungary in* 1514, depicting the insurrection of the Hungarian peasants. *The Village Notary*, to the great damage of the author's popularity after 1848, was translated into German by Count Mailáth, and from thence into English. In the first Hungarian Ministry Baron Eötvös was made Minister of Public Instruction, but when the peaceful revolution developed itself into civil war, he felt himself out of his element, and retired to Munich, where he lived till 1851. His pen was, however, not idle, and in 1850 he published at Leipzig a pamphlet in the German language entitled *Ueber die Gleichberechtigung der Nationalitäten in Oesterreich*. This was followed in 1851 by the first volume of his work entitled *The Influence on the State of the Prevailing Ideas of the Nineteenth Century;* the second volume of this work appeared in 1854. These volumes were published both in German and Hungarian, the former being the original written by Eötvös himself. He was engaged during his last illness in the correction of the Hungarian version. Of the Kisfaludy Literary Society he had been elected president in 1847, and in 1855 he was elected vice-president of the Hungarian Academy. Between that year and 1859 there appeared from his pen a novel and a small collection of poems. During this period he also published anonymously, in German, a work entitled *Die Garantien der Macht und Einheit Oesterreichs*, which also caused him a certain amount of unpopularity, as it was appealed to by M. Schmerling and the Viennese constitutional centralists as foreshadowing their own system. In 1860 he published, at Leipzig, another treatise in German, qualifying the deductions legitimately or illegitimately drawn from its predecessor, and entitled *Die Sonderstellung Ungarns vom Standpunkte der Einheit Deutschlands*, translated into Hungarian by M. Toldy. During the last few years he has again retired into literary life, producing a volume of maxims and an important pamphlet on the mutual relations of the nationalities in Hungary. On the death of Count Emil Dessewffy, in 1866, he was elected president of the Hungarian Academy. On the re-establishment in January, 1867, of the Hungarian constitution he again became Minister of Public Instruction, which post he held till his death. Collections of his parliamentary speeches and of his orations delivered before the Hungarian Academy and the Kisfaludy Society have been published.

Personally Baron Eötvös was a most amiable man, beloved and respected by all who knew him. He had the merit of having early perceived the necessity of raising the standard of culture and extending education among his countrymen of all classes. His European education and admiration of M. Guizot's system of government placed him often in opposition to the majority of Hungarian politicians, by whom he was called a *doctrinaire*. In writing Hungarian his involved style betrayed the influence of his German studies.

Speaking of the losses which the interests of literature and science have sustained through the siege of Paris, the *Pall Mall Gazette* says that not a few eminent professors and members of the Institut have been serving in the ranks of the National Guard and Army of Defence, and it is hardly possible that they can all have escaped without injury. Already we learn that the editor of *Les Mondes* has been wounded by the explosion of a shell; that M. Desnoyers fils, of the Museum Library, has been killed, and that M. Thénard is a prisoner in Germany. The Galleries of Zoology and Mineralogy have both been penetrated by shells; the Collège de France has not escaped unhurt; and the Meteorological Observatory lately erected in the Champ de Mars has been converted into barracks. In the Jardin des Plantes and Jardin d'Acclimatation the ruin has been complete, all the animals having been slaughtered either for food or by way of precaution, and the rare trees—some of them of priceless value—cut down for defensive purposes or else to make charcoal. In the gardens and nurseries outside the city the devastation has been equally severe. Châtenay, the chief establishment of M. Croux, formed the headquarters of the Bavarian artillery; the large palm-house was turned into a stable and the flower-tubs used as cribs. Sheep and cattle have been depastured in the Jardin pour les Études pomologiques, near Aulnay, and everywhere the young trees have furnished stakes for gabions and branches for faggots.

Professor E. Böhmer gives in No. 4 of *Im Neuen Reich* an interesting account of the *Almana provencau* for 1871. This almanac is written entirely in the southern patois, the wreck of the magnificent langued'oc, and the chief aim of its editors, the Felibre brotherhood, is to preserve the national language and customs of Provence against the centralising tendencies of Parisian civilisation. Not long ago Professor Böhmer gave us instances of the strong anti-northern feeling expressed in such poems as "The Countess," the fair lady, brown with the sun and crowned with the fruits and flowers of the south, who was kept in confinement by her nearest kindred for the sake of her riches. In the present emergency, however, the sympathies of the Provençaux seem to be patriotic to a degree, and the chief part of the almanac is filled with songs of hatred and defiance against the German invader.

One peculiarity of the Provençal literary movement is its religious character, which is represented in the almanac by a penitential psalm by Mistral, and some "Provençal Prophecies," the latter containing an account of two marvellous apparitions of the Blessed Virgin, who, as the author remarks with patriotic pride, "on both occasions used the Provençal language."

Prince Hermann of Pückler-Muskau, the well known author and traveller, died on Feb. 4, in his castle of Branitz, aged 85.

His celebrity dates from his book, *Briefe eines Verstorbenen*, which made a great sensation forty years ago. Under the name of "Semilasso" he described his travels in Asia and Africa, and appears in the satirical part of Immermann's classical romance, *Münchhausen*. In his character of aristocratic *blasé* he was also severely handled by Heine and by Börne.

In a recent pamphlet of twenty-three pages, by Mr. W. E. A. Axon, is a list of all the works written in the Lancashire dialect known to the compiler, whose own contributions to it are *Cousin Liz*, *The Haunted Bridge*, *Dr. Rondeau's Revenge* and other sketches, *Folk-song of Lancashire* (not yet published), *The Black Knight of Ashton*, and the *Boggart of Orton Clough*. One of the most important books of the series is Tim Bobbin's *Dialogue between Tummus and Meary*, the real name of the author being John Collier. The list is a tolerably extensive, but not quite exhaustive one. We should certainly be justified in adding to it Mr. J. P. Morris's *Glossary of the Words and Phrases of Furness* (London: J. R. Smith, 1869), and the various tracts in the Furness dialect, since Furness belongs to North Lancashire. The dialect is an important one, and serves to illustrate many of our older poems.

The new number of the *North British Review* contains an article on "Provençal Versification," in which the writer dwells at length on the high artistic finish of the poetry of the Troubadours. Besides the works of the poets themselves, the chief sources laid under contribution are the old Provençal metrical book *Las leys d'amors*, and the *De vulgari eloquentia* of Dante, the application of whose rules to Provençal canzos throws a new light on the construction of the stanzas. The harmonious forms of these skilful combinations are traced back to their metrical and, as far as possible, musical principles. Considering, however, how little is known on the subject in this country, the writer might have done better if he had prefaced his difficult bit of exposition by a literary article of more general interest.

No part of Spain is less known than the mountain region of Galicia and the Asturias, the cradle of the Christian monarchy. Yet this north-western corner is unsurpassed in the beauty of its scenery, the extreme antiquity of its churches, and the interest attaching to its songs and traditions. The Gallego language, now only spoken by the common people, but just missed being the court language of Spain in place of Castilian. Alfonso the Wise, as is well known, wrote his "Cantigas" in Gallego. In the last number of the *Revista de España*, a continuation of Señor Fulgosio's notes of a journey through Galicia contains a detailed account of Orense and its cathedral, with some specimens of the Gallego dialect.

Art and Archæology.

Cornelius. [*Cornelius der Meister der deutschen Malerei.* Von Hermann Riegel.] 2nd ed. Hannover: Carl Rümpler, 1870.

Cornelius has occupied for more than half a century a pre-eminent position in the world of German art. Born in 1783, he now lives to see his influence amongst his countrymen still active, to see himself still the object of increasing honour and devotion, and to see the story of his own long life and indefatigable labours told by a worshipper whose ability equals his zeal. Whatever may be the difference of opinion as to the merits of Cornelius as an artist, all students will feel that some account of the career of one who is put forward as the chief and representative man of a school at once so respectable, so numerous, and so active, is a desirable contribution to the history of art during the present century. The second edition of Hermann Riegel's *Cornelius der Meister der deutschen Malerei* amply fulfils all our requirements. Two catalogues are appended to the work, the first giving a chronological list of all the works of the master, and the second arranging them according to the places in which they are at present located, the notes are ample; the text contains elaborate descriptions of, and sympathetic disquisitions on, all the principal undertakings of Cornelius, and an entertaining account of all the chief incidents of his life. In this last respect Dr. Riegel has behaved with admirable judgment: whilst giving a sufficient quantity of personal matter to make his readers take an interest in his hero as a man, he has omitted from his pages the trivial domestic details with which too many biographies are crowded, and as soon as the awkward moments of *Kinderzeit* and *Jünglingsjahre* are passed, the book may be read with undiminished interest to the last.

The picture which it presents to us is a very strange one; we have the ordinary life of the German artist set before us on a large scale. In the foreground stand the master and his scholars bound to him by a strong sense of common interest; and sharing even the feeling with which he regards the poor thrifty plebeian household in the background, we see the daily round of steady grinding work measured out by a fixed plan, and varied at stated intervals with moments of *hohe Begeisterung*, attained by the help of a *Humpen Bier und dreimal hoch!* With ever increasing wonder the reader realises the poverty of the general mental culture of these exponents of an art which has its root in learned theory. How were these men, living in their miserably narrow sphere of interests, lit up only by a sincere enthusiasm for the poets and romancers of the Fatherland, to treat as they professed to do with learned intelligence what they called the highest ideas of philosophy, and the epics of Greece and Rome? Niebuhr, writing from Rome, speaks of his confidential intimacy with Cornelius and the other German artists residing there, but complains, "only our talk is not inexhaustible. Matter fails them, and I must go over into their circle of ideas; they cannot enter mine." This was written in 1817, when Cornelius was no longer a youth, who might be supposed to be wholly absorbed by the demands of his early training, but a man of between thirty and forty years of age, who had already been engaged on some considerable works. There were the decorations of the Casa Zuccaro, undertaken by Cornelius, Overbeck, Veit, and Schadow, for their friend Bartholdy, and later the frescoes of the Villa Massimi, on which he was engaged when the important works in contemplation at Munich gradually absorbed all his thought and time. He had first signalised himself in what Dr. Riegel calls the *deutsch-nationale* epoch of his activity, by his illustrations to *Faust*, and later to the *Nibelungenlied*. These

illustrations were conceived under the influences of the romantic school, influences which were soon dispelled in Rome. A comparison of these early drawings with the decorations of the Glyptothek at Munich will show how entirely the character of his work had been changed during his sojourn in Italy.

We now come to a curious moment of his life. After a while the atmosphere of Munich began to tell upon him, and a strong Catholic bias, which characterises his fourth period, is evident in the frescoes of the Ludwigskirche, his last work there. But a call to Berlin arrived at the critical instant. Cornelius, a born Roman Catholic, had too much vigour of mind and soundness of nature to sink into a second Overbeck. The cooler air of the northern city brought a reversion of sentiment, and he regained in his old age the standpoint of his middle life. In 1842, Cornelius left Munich for Berlin, and the twenty-eight years which have since then elapsed, are included by Hermann Riegel, under the title of *classische Epoche*. King Frederick William IV., by the execution of two vast projects, hoped to make Berlin as the art capital of North Germany the rival of Munich. A Protestant *Dombau* was to take the place of the Ludwigskirche, and instead of the Glyptothek there should stand in connection with it a churchyard built after the fashion of the Campo Santo at Pisa, reserved as a burialplace for the royal house. Cornelius received the commission to execute the frescoes which should line the walls surrounding the court, and also an order to design the picture for the centre of the apse of the Cathedral. His drawings for the walls of the Königsgruft, which are now in the Weimar Museum, were engraved and published by Wigand, of Leipzig; his early illustrations are also accessible in the form of engravings, but as his main efforts have been expended on mural painting, we cannot gain any adequate idea of the capacity of Cornelius unless we visit his works on the spot. It is difficult for one not German by birth to fairly estimate Cornelius. The very ground on which these philosophical histories and epics are built seems unsound in the eyes of those not trained in the same school. Dr. Riegel, who may be taken as the mouthpiece of a large body of his countrymen in this matter, states that the great problem of the century was for Germans to embody *deutschen Geist* in forms of Hellenic beauty. This, he says, was done in literature by Goethe, in art by Cornelius. Through him the German school has been the heir of classic art. The mantle of Phidias was seen to fall on the shoulders of Cornelius as he contemplated the Elgin marbles in the British Museum. It is hard, Dr. Riegel frankly acknowledges, to contemplate or understand the pictures of Cornelius, and he adds with less certain truth, the more beautiful and full of thought they are, the harder. Here we come to the very point on which Germany must join issue with the rest of the civilised world. If beauty is wholly supersensuous, if lofty and serious aims alone can make a consummate artist, undoubtedly we must hail Cornelius as such. But it must be understood that the theory which places him upon this pedestal is an inversion of all previous theories respecting art, and that, if a large share is to be allowed to the sensuous element, his claims must be moderated. In 1811 Goethe wrote to Cornelius in warm and ready commendation of his seven first illustrations to *Faust*, but it is evident from the concluding portions of the letter that he perceived a something lacking in the work. What the quality was which he missed, he was clear about, but how it came to be absent was not so plain; so he fastens on the influence which early German masters had apparently had on their conception, and suggests that the exclusive study of those Italian painters who flourished when their school had reached its fullest development might ripen *Sinn und Gefühl* in Cornelius. *Sinn und Gefühl* are the two qualities indispensable to the making of a genuine artist; if inborn, they may indeed be ripened by exterior influences, but no contemplation of perfect models, however assiduous, no study however zealous, can implant them where by nature they are not. These are the qualities which appear to be wanting not only in Cornelius himself, but more or less in the whole of that great German school of which he is the representative. Those to whom the German atelier is familiar know its conspicuous merits: the quiet masterly draughtsmanship, the sober renunciation of flashy work and unsound methods; but these are counterbalanced by slavery to set plan, and the rooted convictions that once for all the laws according to which alone the art of the future can develop itself have been fixed, and that only by stout adherence to the course initiated by the German artists settled in Rome in 1810 can legitimate results be achieved.

Great results are achieved, work is done so good that it seems mere impudent presumption to say, it is not good; but no amount of human intelligence and industry can produce the subtle flame which kindles life; indeed the very perfection of the science with which we bring them to bear destroys the spontaneity of inspiration. Cornelius is a man of commanding ability, of exalted character, sincere in zeal, lofty in aim, unremitting in endeavour, considerable in achievement, but he himself has said: "*Ich erkenne nichts als Kunst an, was nicht lebt.*" This is a high standard, the highest and yet the only one in art, and it is, when tried by this test, that he himself falls short. E. F. S. Pattison.

THE DATE AND SUPERSCRIPTION OF MR. FULLER MAITLAND'S BOTTICELLI.

(No. 278 at Burlington House.)

TO THE EDITOR OF *THE ACADEMY*.

Sir,—With your leave, and by way of supplement to Mr. W. B. Scott's remarks upon the above picture, I beg to submit the following notes of the very singular legend in Greek capitals written in two and a half lines just below the frame. Here are the words as I read them:—

ΤΑΥΤΗΝ · ΓΡΑΦΗΝ · ΕΝ · ΤΩι · ΤΕΛΕΙ · ΤΟΥ · ΧΣΣΣΣΣ · ΕΤΟΣ ·
ΕΝ · ΤΑΙΣ · ΤΑΡ ΤΗΣ · ΙΤΑΛΙΑΣ · ΑΛΕΞΑΝΔΡΟΣ · ΕΓΩ ·
ΕΝ · ΤΩι · ΜΕΤΑ · ΧΡΟΝΟΝ · ΗΜΙΧΡΟΝΩι · ΕΓΡΑΦΟΝ · ΓΑΡΑ ·
ΤΟ · ΕΝΔΕΚΑΤΟΝ · ΤΟΥ · ΑΓΙΟΥ · ΙΩΑΝΝΟΥ · ΕΝ · ΤΩι ·
ΑΠΟΚΑΛΥΨΕΩΣ · ΒΩι · ΟΥΑΙ · ΕΝ · ΤΗι · ΑΤΣΕΙ · ΤΩΝ · Ι ΑΙ ·
ΗΜΙΣΥ · ΕΤΩΝ · ΤΟΥ · ΔΙΑΒΟΛΟΥ · ΕΠΕΙΤΑ · ΔΕΣΜΟΘΗΣΕΤΑΙ ·
ΕΝ · ΤΩι · ΙΒΩι · ΚΑΙ · ΒΛΕΨΟΜΕΝ · ΓΑΤ ΝΟΝ · ΟΜΟΙΟΝ ·
ΤΑΥΤΗι · ΤΗι · ΓΡΑΦΗι.

Most of this is quite plainly written; the only doubtful places being—

(1) The lacuna after ΤΑΡ in the eleventh word, where the canvass has been rubbed bare. This, I think, may with confidence be filled up thus: ΤΑΡ[ΑΧΑΙΣ].

(2) The effacement of parts of two letters between Ι and ΑΙ at the twenty-seventh word. These, for reasons afterwards to be seen, we may certainly read [Γ Κ]ΑΙ.

(3) The indistinctness of the letters which I read ΓΑΤ, and the lacuna (consequent on repainting) which follows them, in the fifth word from the end. Here I am inclined, although with diffidence, to supply ΓΑΤ[ΟΥΜΕ]ΝΟΝ.

The inscription I would then read, point, and construe thus:—

Ταύτην γραφὴν ἐν τῷ τέλει τοῦ χσσσσσ ἔτους ἐν ταῖς ταραχαῖς τῆς Ιταλίας Αλέξανδρος ἐγώ ἐν τῷ μετὰ χρόνον ἡμιχρόνῳ ἔγραφον, παρὰ τὸ ἐνδέκατον τοῦ ἁγίου Ιωάννου, ἐν τῷ Αποκαλύψεως δευτέρῳ [βωι] οὐαί, ἐν τῇ λύσει τῶν γ′ καὶ ἡμισὺ ἔτων τοῦ διαβόλου. ἐπεῖτα δεσμωθήσεται (ἐν τῷ δωδεκάτῳ [ιβωι]) καὶ βλέψομεν πατούμενον ὅμοιον ταύτῃ τῇ γραφῇ.

"This picture I, Alessandro, painted at the end of the year 1500, in the troubles of Italy, in the half-time after the time, during the fulfilment of the eleventh of John, in the second woe of the Apocalypse, in the loosing of the devil for three and a half years. Afterwards he shall be chained, and we shall see him trodden down as in this picture."

Proceeding to details, it must l e premised that the Greek is of course base from beginning to end.

XΣΣΣΣΣ. I do not know how these numerals can be legitimately explained. It is hardly doubtful that 1500 is the date indicated, as it has been read by Messrs. Crowe-Cavalcaselle and by Mr. Scott; but how? In Greek numeration X = 600, Σ = 200; but this will not hold here. It is much more probable that X is put as short for *χίλιοι* = 1000, and that ΣΣΣΣΣ = 500; but what I have not yet been able to find is a precedent for Σ in this sense of 100. It has been suggested to me that Botticelli may have taken it into his head that, as in Greek Σ and C are forms of the same letter, and in Latin C = 100, therefore also Σ = 100. Or can he have learnt that P is the true symbol for 100, and gone off and used the next letter of the alphabet by mistake? Without entering into this difficulty at all, Schorn in his notes on Vasari (vol. ii. 243-4) says that the last Σ may be read Ξ (which it quite certainly may not), and that then the date would be 1460. And Dr. Waagen, without a word, and for no reason that I can conjecture, reads it as 1511. On historical grounds alone each of these dates is equally inadmissible. Alessandro, the son of Filipepi, was born 1437 and died 1515. Schorn would thus hold the picture to have been painted at 23, when he would have been a disciple of Lippo Lippi's fresh from the goldsmith's shop; Waagen at 74, within four years of his death, and therefore at a time when he would have already become, in the words of Vasari, "old and helpless," walking with two sticks because he could not hold himself upright, "infirm and decrepit." The execution of this picture is as much too free and confident for a juvenile work as its invention is too passionate for a senile. Let us accept hypothetically the date 1500.

EN TAIΣ TAPAXAIΣ THΣ ITALIAΣ. "In the troubles of Italy." The appropriateness of this is obvious. The troubles of Italy, dating from the invasion of Charles VIII. in 1494, were still at their height in 1500. The previous year had seen the treacheries and vicissitudes of the war between Florence and Venice for the occupation of Pisa, the ever-shifting intrigues of Lewis Sforza with Lewis XII., with Maximilian, with Bajazet, with the Pope, his war against France and the Venetians; this year saw his disaster and imprisonment, the French victorious in the Milanais, the aggravation of local tyranny under the Pontifical Vicars, the sinister alliance drawn closer between Cæsar Borgia and Lewis XII., universal warfare, spoliation, depopulation.

EN TΩι META XPONON HMIXPONΩι. "In the half-time after the time." This is a reminiscence, or loose quotation, of more than one Scriptural prophecy. The mystical period of three and a half years occurs in Daniel, first as "a time and times and the dividing of time" (vii. 25), and again as "a time, times, and a half" (xii. 7). In the Apocalypse we have the "three days and a half" (xi. 9 and 11), during which the dead bodies of the two witnesses are to be seen by "them of the people and kindreds and tongues and nations;" and the "thousand two hundred and threescore days" (= 3½ years), during which they shall have prophesied before their death (xi. 3); and we have again the same "thousand two hundred and threescore days," as equivalent to the "time and times and half a time" (*καιρὸς καὶ καιροὶ καὶ ἡμισὺ καιροῦ*), during which the woman persecuted by the dragon is to be nourished in the wilderness (xii. 6 and 14). Interpreters of prophecy have not agreed whether this period is to be understood literally or only mystically. If, as I think probable, Botticelli did understand it literally, it is still doubtful whether by his incorrect phrase *μετὰ χρόνου ἡμίχρονος* he meant to express *καιρὸς καὶ ἡμισὺ καιροῦ* (= 1½ year), or, as I again think probable, the entire *καιρὸς καὶ καιροὶ καὶ ἡμισὺ καιροῦ* (= 3½ years). In the former case he would date the beginning of the period of affliction a year and a half before his time of writing, *i.e.* in the first half of 1499; in the latter case, three years and a half before, *i.e.* in the first half of 1497.

ΠAPA TO ENΔEKATON TOT AΓIOT IΩANNOT. "During the fulfilment of the eleventh of John." It is very possible that *παρά* is simply a barbarism for *κατά*, "according to;" but the meaning "synchronous with," "at the time of," gives, I think, better sense as well as slightly better Greek. The reference to the eleventh chapter clearly shows that the particular visitation which the painter has in his mind is the killing of the two witnesses by the "beast that ascendeth out of the bottomless pit" (Rev. xi. 7). We know that Botticelli was a persistent follower of Savonarola—"*ostinato a quella parte*," says Vasari—and I think it is probable on the face of it that in the martyrdom of Savonarola and his companions (on the 28th of May, 1498) he saw the fulfilment of the above prophecy. The *two* witnesses would be Savonarola and Domenico Buonvicini di Pescia, whose fame almost equalled that of his master (Silvestre Maruffi, the third martyr, being a person of altogether subordinate importance).

EN TΩι AΠOKAΛTΨEΩΣ BΩι OTAI. "In the second woe of the Apocalypse." This clause is added in epexegesis to that preceding it, and shows that Botticelli comprehends by the "second woe" the slaying of the witnesses. The first paragraph of the same eleventh chapter of the Revelation ends with the words, *ἡ οὐαὶ ἡ δευτέρα ἀπῆλθεν· ἰδοὺ ἡ οὐαὶ ἡ τρίτη ἔρχεται ταχύ*. St. John thus makes *οὐαὶ* feminine; but we have seen that Botticelli's scholarship is small; and again (as Professor Lightfoot has been kind enough to point out to me) he is writing in all probability with no Greek Testament before him, its first publication having been in 1516; and the natural gender of the word would be neuter, as Dr. Lightfoot has in fact found it in the *Apostolic Constitutions*, ii. 10.

EN THι ATΣEI TΩN Γ KAI HMIΣT ETΩN TOT ΔIABOLOT. "In the letting loose of the devil for three and a half years." A further epexegetical clause, indicating that the half-time after the time, the fulfilment of the eleventh of John, the second woe of the Apocalypse, and the letting loose of the devil for three and a half years, are all identical and all synchronous with one another and with the troubles of Italy. Here the writer's recollection seems to have supplemented or mixed up Rev. xi. 7, which speaks of the dragon ascending out of the bottomless pit against the witnesses, with Rev. xx., which speaks of him as being "loosed for a little season" after having been bound for a thousand years (verses 3 and 7); and to have further confused or identified this "little season" with the "time, times, and half a time," above discussed. Hence the obvious restoration of [Γ K]AI = 3½ years.

Reverting to the supposition that Botticelli at the end of 1500 conceives himself to be living literally in the last half-year of three and a half years of persecution, what events occurred in the early part of 1497 to which he could allude as its beginning? I think the embittered measures of Alexander VI. against Savonarola in the spring of that year (bull of excommunication, May 12) and the increasing pertinacity of the Arrabbiati in Florence, together with his loss of credit at the time of the plague in June and of the execution of the Medicean conspirators in August—I think all these things, in spite of the temporary triumph of his party in the first two months of 1498, might well be taken to mark the time of the loosing of the beast and his "making war against" the witnesses, *i. e.* the first great shock given to the power of Savonarola and the Piagnoni in the state. I do not know of any occurrences in the first half of 1499 to which a similar significance could be attached.

EΠEITA ΔEΣMOΘHΣETAI EN TΩι IBΩι. "Then he shall be chained in (or according to) the twelfth." Rev. xii. 7-9 tells how there was war in heaven, and how that old serpent was cast out into the earth, and his angels were cast out with him. There is nothing here of "chaining;" but I think Botticelli has again confused or identified with this passage the "binding him," "shutting him up," "setting a seal on him" (*ἔδησεν, ἔκλεισεν, ἐσφράγισεν*), of Rev. xx. 2 and 3. In the picture itself, the five devils that have fallen transfixed on the ground, with a half-buried devil's face almost lost in the right-hand corner, would precisely illustrate the casting out of Satan and his angels after the war in heaven.

BLEΨOMEN ΠATOYMENON OMOION TAYTHι THι ΓPAΦHι. "We shall see him trodden down as in this picture." If this reading is right, Botticelli alludes to the position of the vanquished devils about the feet of the men and angels who embrace in the foreground of the picture; and indicates his belief that at the end of the half-year in Italy the Devil will be controlled and the troubles stayed by some supernatural intervention.

We have thus seen (at sad length I fear) how something like a coherent meaning, although far from a certain one, can be traced in this mystical inscription; of which it is hardly possible to overrate the interest, as throwing light at first hand on the actual thoughts of an artist who, for all his speculative and self-conscious habit—"*per essere persona sofistica*," as Vasari puts it—yet lost nothing of the freshness of inspiration. It is of course possible that one goes wrong in trying to give a precise interpretation to what may have been only the semi-Scriptural expression of a vague sense of visitation, and a vague hope of its end.

It might give us greater certainty in the matter if we were in possession of Savonarola's own interpretations of the Apocalypse, but nothing precise is recorded of these. His expositions of the book

belonged to an early course of sermons, begun in August of the year 1490, and never published; he only tells us vaguely (*Compendium revelationum*) that in them he developed the three propositions—"that the renovation of the Church would take place in our own time," "that before that God would visit Italy with a great scourge," and "that these things would happen speedily."

Having given the best account I can of this inscription, it is necessary to point out what is clearly wrong in that of Schorn (*loc. cit.*), the only critic who has gone into it in detail. Schorn reads it as above, only putting TAI for TAP before the first lacuna, IAΦ for ΓAT before the last, and then reconstructs as under:—

ταύτην γραφήν ἐν τῷ τέλει τοῦ χσσσσσ (or χσσσσξ) ἔτους ἐν ταῖς χώραις (!) τῆς Ιταλίας Αλέξανδρος ἐγώ ἐν τῷ μετὰ χρόνον ἡμιχρόνῳ ἔγραφον, παρὰ τὸ ἐνδέκατον τοῦ ἁγίου Ιωάννου ἐν τῷ Αποκαλύψεως βιβλίῳ. Οὐαί ἐν τῇ λύσει τῶν γ' καὶ ἡμισὺ ἐτῶν τοῦ διαβόλου. ἐπεῖτα δεσμωθήσεται ἐν τῷ ἀβύσσῳ [ABΩι] καὶ βλέψομεν Ι[ησοῦν] ἀρ [ημένον] ὅμοιον ταύτῃ τῇ γραφῇ.

To conjecture χώραις where he finds TAI is strange. BΩι is much less likely to be a contraction for βιβλίῳ than a symbol for δευτέρῳ. Οὐαί ἐν is an improbable construction. It is pure violence to substitute ABΩι for IBΩι, and makes it a contraction for ἀβύσσῳ. I might possibly be short for Ιησοῦν; but what would be the sense of ἀφημένον, "sitting apart"? Schorn translates it merely "sitzend;" but I doubt if such a Graecist as even Botticelli would so use it.

Before parting from the picture, I should also notice the slip by which Messrs. Crowe-Cavalcaselle speak of the inscription as being at "the foot" instead of the head.

The inscriptions on the banderols contain some further puzzles. On those of the upper choir of angels can be traced GLORIA IN EXCELSIS twice repeated, the word SACRARIVM several times, REGINA SOL more than once, and the syllables CELEST and SPES IN. The left and right hand angel on the ground both carry upon theirs the sentence (or part of it) HOMINIBVS BONÆ VOLVNTATIS.

Sidney Colvin.

EXHIBITION OF WORKS OF THE OLD MASTERS AT BURLINGTON HOUSE.

III.

FLEMISH SCHOOL.

The greater attractions of this large gathering are to be found in the Venetian and other pictures of the Italian schools, which are of a beauty and poetry quite superior in kind as well as in quality to the works of men north of the Alps, but it is nevertheless very interesting to turn to the latter and analyse the difference here, where the productions of all countries, true and false, hang side by side.

In the earlier ages of painting both in Italy and in Flanders we find the different national character less decisively marked, and we must remember that the arts were sooner important in Italy than anywhere else, and that the antique remains made an inestimable educational difference, the art of sculpture preceding that of painting perhaps a century. These considerations, however, leave the vast gulf of separation unbridged, and we are forced to fall back on distinct national character as the explanation. It is true the fourteenth and fifteenth centuries in Italy are scarcely represented here, but in the Triptych by Fra Angelico (313) we have one picture of importance which we may accept as truly representative of the early 1400, and contemporary with Van Eyck. In Fra Giovanni, grace and loveliness make us forget the childish gorgeousness of costume, and the painful mythologic mediævalism, and if we go back even to the beginning of Italian as distinguished from Byzantine art, we find the same motive. Beauty and the direct expression of it for its own sake is in every line, while a century and a half later north of the Alps we can detect no such artistic inspiration. The centre of the triptych we have mentioned is the Last Judgment, and in it the angels are every one of them diapered and flounced with patterns in gold, and behind the figure of Christ at the top of the picture the mass of angels' wings, all covered with eyes like the tails of peacocks, is surprising and in a way delightful; in a way only, because the attempt to elevate the angelic nature by assimilating it externally to that of this foolish bird is only childish; while below, the elect who are embraced by the heavenly messengers sent to conduct them home are nearly all tonsured. As to the damned, they have no golden raiment—one would say, pride of apparel was not their sin. On one side the volet exhibits the ascension of the blessed, and here Fra Angelico is worthy of his name: nothing has ever been done on canvass more pure and innocent in sentiment, and more graceful and lovely in expression, than those pairs of saints and angels ascending from the earth to the firmament.

No invention comparable or even analogous to this is to be found in early German or Flemish work. The northern painters kept to the solid earth, and the real facts of their neighbourhoods, but at the same time it was also impossible they should clothe angels in cloth of gold and make them into peacocks. In their works invariably, as far as we remember, the angels are in white raiment, with doves' wings. Exceptions to this there may be, but where such is the case, an explanation is to be found. In the "Celebration of the Mass" (326) by John Van Eyck, an angel descends with benediction, and this, the only example we can point to here, will illustrate our comparison. It is not lovely, certainly, and the drapery is folded about the figure in the complicated small folds prevailing down to the times of Dürer and Lucas of Leyden, but the motive of splendid colour being absent, we have propriety of conception. A little later we find in Venice and elsewhere that art for its own sake becomes entirely objective, a pleasure to the eye and a mystery to the uninitiated. It is needless to ask the meanings of things, and the amateur critic begins to talk nonsense in attributing occult reasons and intentions where the artist meant only chiaroscuro and colour, variety and gladiatorship.

Of Van Eyck we have here three pictures. The first of these, St. Jerome, called foolishly in the catalogue "A Philosopher in his Study," it is perhaps impossible to affirm positively to be from that master's hand, but it is inestimable as an early Flemish work of the finest order. The saint is mounted on a platform with his desk before him, and his shelves with his few books behind. These are open for reference where he sits at his *opus magnum*, and every detail is made out with propriety and delightful *naïveté*. At the bottom of the steps to his platform lie the shoes he has thrown off before beginning his work, and his lion, not having found himself wanted, is to be seen round the corner as if he had taken a constitutional, and was now on his way back. Against the wooden wall behind the doctor's desk there is a little white label pinned up with an appearance of writing on it. But here the dear old Fleming has dared to be guilty of a little ruse, as we found on going armed with a microscope that nothing was to be read on the same. The second Van Eyck is Mr. Beresford Hope's "Madonna and Child" (273). This well known and perfect little panel it is a great pleasure to see again; and the third is the "Celebration of High Mass," with the angel descending. So awkwardly does he fly indeed that he seems to be sitting on the bar on which a curtain runs, but still with a great charm of reality and naturalness, so that the total want of surprise or even observation on the part of the human actors is perfectly just. The subject of this admirable piece of Flemish elaboration must be within reach of a little study, the principal figure (after the officiating priest) being an emperor, with the German Kaiser's crown on his head. Much as we have seen of elaborate making out of stuffs and materials with patterns and gold thread, this small picture, 24 in. by 18 in., is even exceptional in this respect. Behind the raised arms of the priest is a golden reredos of Byzantine work, the subject being Christ in the centre and the four Evangelists round in elaborate borders. The whole is *repoussé*, set with precious stones, an inestimable labour of the goldsmith's art, which must have been carefully and exactly elaborated from an original. Indeed, the whole interior strikes us as being a portrait of some place, although the position of the altar at which the mass is being said requires explanation. On the prie-dieu, covered with a velvet pall, at which the Kaiser kneels, his coat of arms is emblazoned in gold embroidery, another instance of miraculous elaboration. What time must have been spent, and what chemical tests employed, before this picture and the "Madonna and Child," and the portraits in the National Gallery, inscribed "Johannes de eyck fuit hic, 1434," were painted! And now, after four centuries and a half, they promise to remain intact for ever, while all the frescoes in Italy are crumbling to pieces, and the oil pictures becoming black. The early tempera paintings

only will ultimately remain visible to the world a thousand years hence; but those by Van Eyck, supposed to be in oil, as far as we can see, will undergo no change.

In the "Virgin and Child under a Canopy" (226), by John de Mabuse, we have the production of a century later than those we have examined, and yet little progress is apparent. Here the oil is certainly undergoing its usual darkening, but the ambition of the artist has manifestly been no other than the elaboration of details. The character of the Madonna is common, and yet the individuality is lost: the background of renaissance ornament is really the interest of the painting, and this is so little admirable now, and so overdone in quantity, that the impression is rather painful than otherwise. The period of change in northern art followed the reformation, not beneficial at first but still emancipation, leading to freedom and such victories as those of Rubens and Rembrandt. This transition time is represented here by two pictures (297, 301) by Henry Goltzius, in which, however, we fail to see the bizarre excess of style characterizing his engraved designs. Of the two greater masters we have mentioned here are many and noble examples; indeed both but especially Rembrandt, are admirably represented; as in "Christ Preaching" (345) and the portraits. Of these, how absolutely perfect are the Marquis of Westminster's well known pair, "Portrait of a Man with a Hawk" (126), and "Portrait of a Lady with a Fan" (136). The wonder in this art of Rembrandt is that breadth and detail, roundness and precision, are equally given; and that while art was everything to him, so that colour, light and shade, and other technicalities in manner were all in all, the result is so true to nature, the eyes are thinking, the lips moving, and the whole action of body, face and hands of this little woman with the fan, for example, has the unmistakable unity we recognise in life. In the head-dress, attached in some way, there is a crimson feather, very much kept down so as to be scarcely visible, the only exceptional point, both in the costume and colour of the picture. With Rembrandt it was always an effort to exclude his rubbish of caftans, feathers, turbans, and what not, things he called his "antiques," in derision of those who admired the sculptures of Greece and Rome. This little woman, who is undoubtedly a lady, perhaps insisted he should darken this feather nearly out of existence.

W. B. Scott.

THE DUDLEY GALLERY EXHIBITION OF WATER COLOURS.

This pleasing little exhibition is not one of those that need to occupy our space very largely. It has this year quite attained its level, and will be visited by all who like the charming small landscapes from nature with which it abounds. Apart from these, there is very little indeed calling for notice, and the only pictures that presume to rise to dramatic emotion and poetical character are two by ladies. Highly accomplished works there are besides, no doubt, especially those of Messrs. Marks and F. W. Burton; but in subject Miss Lucy Madox Brown, and Miss Spartali are more ambitious, and have succeeded so remarkably that they seem to demand more detailed notice than the better known and able men we have mentioned. At the same time it is seldom we see anything so thoroughly complete and harmonious as the Roman child, "La Romania" (172), by Mr. Burton, making up her bouquet, sitting nestled among the carved fragments of antique marble; and Mr. Mark's "Thoughts of Christmas" (269) is one of the most enjoyable pictures he has ever done. The background of forest-tree stems in a dry autumn is very good indeed, and the swine are unexceptionable. They have that queer winking twinkle in the eye, a mixture of watchfulness and contentment, while the "Friar Dan," who mentally picks out his Christmas dinner among them, although there is something porcine in his physiognomy, is not the least of a brute; on the contrary, he is a rather fine fellow, and has been reading his book as he takes his walk.

"Romeo and Juliet" (336), by Miss Madox Brown, takes us rather by surprise. It is the scene in the tomb of the Capulets, when Romeo, with murder on his hands and self-sacrifice in his heart, looks on the sleeping not dead Juliet, and calls out, "O, my love! my wife! Death, that hath sucked the honey of thy breath, Hath had no power yet upon thy beauty:" and yet, madly believing that she was dead, takes the poison. His face is lit, not by the torch that attracts Friar Lawrence, who asks a few minutes after, "What torch is that? It burns within the Capel.' monument!" but by the moonlight that streams down the steps of the tomb, not directly on the face of the doomed boy, but reflectedly, principally from the white dress of Juliet. This substitution of moonlight is an admirable thought, and shows a true poetic instinct in the painter, which is further borne out by the invention of the picture in all its parts, the bier with its pelican embroidery, the iron-work behind Romeo, and the churchyard above the steps, with the page or Balthasar sitting under a tree with his lantern by him. All this is, of course, in such a subject, secondary to the passion expressed on the faces of the actors; and here Miss Brown sustains her noble task. She has not indeed given the respective ages with accuracy; Juliet, as we learn from the nurse, being only fifteen, while Romeo is old enough to have had a first love before their meeting at the masque; but the profile of the face of Juliet is very fine and true, the whole line of the figure admirable, and the passion in the eyes and mouth of Romeo worthy of a Shakespearean illustrator.

"Antigone gives Burial Rites to the Body of her Brother Polynices" (75) is Miss Spartali's picture, the single other poetical picture, except some landscapes, particularly those by Madame Bodichon in this collection of 665 productions. Polynices, who died in single combat with his brother Eteocles, to prevent the battle, is carried out dead at the end of the drama, *The Seven before Thebes*, while the chorus of Theban virgins determine to follow him—"Unwept, unpitied, unattended, save by a sister's solitary sorrows;" and the semi-chorus say also, "We will go, attend his funeral rites, and aid his sister to place him in the earth." The herald and the bearers have thrown the body out on a heath, where Antigone, who is to suffer death for her piety, laments over it and over the woes of her house, throwing the earth in handfuls upon it. The colour of this picture is very fine indeed, and has that unity about it which distinguishes the true painter, excellent colour being, after all, not splendour of hue but harmony. The head of Antigone is nobly felt, and her action also; but still we miss the real subject, and the few pieces of earth lying on the drapery of the dead brother are the only symptoms of her having administered or intending to administer any funeral rites, although some symptoms of preparing a fire are apparent in the background, which seems to contradict the throwing of earth on the body; on the contrary, anointing it with oil would be the proper archæological treatment.

Other ladies there are, exhibiting figure-pictures here, who ought to be mentioned, particularly Miss Ellen G. Hill, in her chalk drawing called "Listless," a very well drawn figure of a half-cast negro trifling with a guitar. It is a great proof of original artistic power in a woman when she does not paint women. The greatest paintress living, or we may say, who ever lived, Rosa Bonheur, never painted a woman in her life. Men are attracted to the opposite sex and its charms of both face and body, as the subject for painting, but women are not so attracted or interested. This test, we imagine, would be unfailing and absolute but for the trenchant fact that no figure-paintings *sell* in England but those wherein female beauty is the attraction. Before leaving the Dudley, let us notice two pictures by a name we do not remember to have met before, Hubert Herkomer. His pictures are "At Trèport—War News; July, 1870" (57), and "The Orchard" (344). What country Mr. Herkomer belongs to we know not, only his pictures are truly English in manner, and of very remarkable beauty and finish, as well as fulness of invention. The style is exceedingly fine and minute, without any triviality. The second picture looks like a portrait composition, but the other is full of figures, all of them admirably drawn and full of character. Wanting space for detail or description, would the reader care to know what particular pictures we have marked in our catalogue, and would recommend him to look at? For lovely sentiment, "Even Song" (530), by Edward R. Hughes; "Cinderella and her Sisters" (123), by C. N. Henry; 199 and 371, by Tom Gray, figure-pictures with singular distinctness of characterization; and 347, a girl's head merely, by Charles F. Murray. Among the landscapes, the works by Madame Bodichon, Messrs. Ditchfield, Donaldson, Arthur Severn, Albert Goodwin, Field Talfourd, and more especially "Blanchisseuses bretonnes" (28), by Joseph Knight, "St. Peter's, from Monte Mario" (182), by J. C. Moore, and "A Pastoral" (517), by E. J. Poynter.

W. B. Scott.

ART NOTES.

Mr. Simeon Solomon is about to publish, under the title of *A Vision of Love Revealed in Sleep*, an ornamental book of some forty pages, with an original drawing photographed for frontispiece. The style of the piece is a poetical prose, and it deals with the same order of ideas that have been illustrated by the author in his imaginative pictures and designs.

Mr. G. D. Leslie is engaged upon a painting of the subject of Nausicaa and her handmaids surprised by Ulysses, from the sixth book of the *Odyssey*.

The new number of *Im Neuen Reich* opens with a lecture on the Roman catacombs, delivered by Theodor Mommsen, on the 13th of January last, before the Berlin Unionsverein. The subject is treated popularly, and with the writer's usual brilliancy. His chief points are to show that underground burial-places in antiquity (originally κρυπτά) were not a specifically Jewish or Christian invention; but proper to the poorer class in crowded cities, and hence most of all to Rome under the Empire. He brings evidence to show that, on the one hand, there existed a pagan necropolis of this kind at Alexandria, and that, on the other, the Christians at Cæsarea and Carthage were buried in open "areæ" or graveyards. He scouts the notion of these burying-places having been constructed in secret, or without the sanction of the imperial police, but admits that they were employed by the Christian community as a shelter for such among their practices as may have been obnoxious to the existing laws. In describing the catacomb now known by the name of Domitilla, he pays a high compliment to the "equally acute and conscientious Giambattista de' Rossi," though not convinced by his arguments on this particular question of appellation. Finally, dating the disuse of the catacombs from the Gothic capture of Rome, he has thought fit to point his narrative with a series of allusions: thus—"In spite of the enormous circumference of the walls, the twelve gates were all beset, commerce on the Tiber was stopped: the pressure of hunger began, they began to ration out the bread. . . . . The government resided far away in Ravenna, inaccessible and impregnable among its swamps; it sent armies to raise the siege, but they never reached, and were separately crushed. The Goth did his best to bring about a peace; his demand was for contributions in money and kind, and the cession of Venetia, Noricum, and Dalmatia. They offered him gold and silver as much as he would, but beyond that nothing was to be got," &c.

To many the name of Sir George Hayter, who has recently died, will carry no very certain impression, and yet he was long a portrait painter of great practice, and in the very core of fashion. When the Princess Charlotte married Leopold, afterwards chosen king of the Belgians, Hayter, then little more than twenty, was appointed their court painter, and painted their portraits, so popular during her short married life, both in miniature and in oil. His early successes made him indifferent to the distinctions artists of his moderate abilities usually covet, and for a considerable time past he has been little before the public. Mr. G. Sant, R.A., has succeeded to the office of Painter in Ordinary to the Queen.

Mr. Henry Green, the author of *Shakespeare and the Emblem Writers* (see *Academy*, vol. i. p. 173), has ascertained that no less than four hundred writers have treated the subject of emblems in no less than three thousand distinct works. He is himself about to bring out a life of Andrew Alciat, with notices of about seventy editions of his emblems. The principal English libraries, both public and private, have been searched for the materials of this work, and the indefatigable bibliographer has also obtained returns from the librarians of all the chief European libraries of the various editions of Alciat which are in their charge.

Mr. Ford Madox Brown has just finished his picture, "Foscari's Wife Visiting her Husband in Prison," a subject taken from Byron's tragedy.

The collection of paintings preserved in three rooms of the Hôtel de Ville at Strasburg was burnt during the siege. The loss is serious, and includes the "Marriage of S. Catharine" by Memmling, a fine Madonna by Perugino, portrait of woman by Miereveldt, and several altarpieces by Philippe de Champagne.

The frescoes by Guffens and Swerts, in the *Liebfrauenkirche* of St. Nicolas, at Antwerp, were uncovered on December 8th with much ceremony. By their extent alone they rank amongst the most important of late undertakings of this kind.

Music.

UNPUBLISHED LETTERS OF ROBERT SCHUMANN.

II.

The following three are Schumann's letters to "Zuccalmaglio," written in 1836:—

(4)

"*Leipzig, Good Friday*, 1836.

"Dear Sir,—I congratulate you heartily on your safe return. Don't keep me long waiting before you tell me about your adventures, and what you have seen: send an account of yourself as soon as you can. Something about Moscow would delight me especially. The name of Moscow always sounds in my ears like the sonorous stroke of a great bell. If you like the tone of the Davidsbündler letters from Augsburg, Berlin, Dresden, and Munich, you would do well to adopt it in your own. This is a good way of working up in an attractive manner a number of facts and circumstances; it gives a certain compactness and colour to the journal, and the people like it. You may picture to yourself the Davidsbund as a kind of spiritual brotherhood, though its visible branches are really pretty widely extended, and will in time, I hope, bear plenty of golden fruit. The secrecy of the thing possesses a peculiar charm for many; and, like everything mysterious, a peculiar power. Not that your former letters from Warsaw did not please me exceedingly; indeed I regard them as some of the best in my journal, as I have told you several times. Your last letter but one enclosed the collection of the *Mosellieder*, and two essays which by this time you will have read in print. The other MSS. (*Fest zu Malin* (?), &c. [name doubtful]) are safe in the hands of my brother. Whether he will print the *Mosellieder* even on commission, I have my doubts. He has at present a great undertaking on his hands, the *Universal Dictionary of Commerce*, by R. Schiebe, which employs a good deal of his time and resources. About the publication of your other manuscripts I hope soon to be able to tell you for certain, as I shall see my brother some weeks hence at the Leipzig fair. Your idea of laying the scene of a tale at Moscow, I think a particularly happy one. Perhaps I shall be able to do something for your manuscript, but can't promise yet. I long to receive your Moscow letters, and anything else from your pen. If you don't hear from me for a considerable time, you must put it down to a trip to the Rhine, whither I am thinking of going with Mendelssohn at the end of April. I told Sonnenwald to send you your copy of the *Zeitschrift* long ago, and have just stirred him up again to despatch it. You had better enquire at Sonnenwald's.

"Yours truly,

"R. Schumann."

(5)

"*Leipzig, July* 2, 1836.

"Dear Sir,—The reason for my long and ungrateful silence has lain in a good deal of distress of mind, out of which I found it impossible to rouse myself for work. It was music at last, and some original musical work of my own especially, and above all the restorative force of a young constitution, the woods and the green leaves, which have brought back courage and energy.* My first lines are to you. Like a child at a Christmas tree, I stood before your presents, and turned them

* The crisis alluded to, however, exercised a highly favourable influence on his creative power, as we also see from a passage in a letter to his friend Dorn (dated 1839) in which Schumann says: "There is certainly much in my music of the struggle which it cost me to win Clara, and I am sure you have understood it."

carefully over and over. Then I grow angry with myself that I can do nothing with the booksellers, and can never get anything more encouraging than 'to-morrow' out of them, spite of all my pains. And the worst of them all (though it must be said in his defence that he has a great bit of work on his hands) is my own brother, with whom, by the bye, your MSS. are all left. This is why I wanted to wait, so as to prepare a little surprise for you, but here I am again with empty hands. This of itself, after so much as I have received from you, is enough to make me sad. Have sent to G. Schwab; and shall to the *Elegante Zeitung*. But why are you so slow to write in your own name? I called on your friends as soon as I received the letter, which came to me by a round-about way. And when I took my chance of finding them at the Hôtel de Russie, they had just left. A great pity indeed. If you want a complete copy of the journal, please say so. Some weeks ago I sent you, through Sonnenwald, a parcel with all your essays, a pretty big collection. I read out your last letter but one to Mendelssohn: we both enjoyed it vastly. He says he doesn't care for male part-songs (*Männergesangquartette*), and doesn't think he can do anything in that way. I hardly think so either. But he will send you something next winter. Your Oratorio I will forward him to Frankfort in a day or two, if he doesn't see it before in print. It seemed to make such an excellent beginning to my new volume that I anticipated your permission to publish it. The last four lines I should like perhaps a little altered: the repetition of 'fest' is a little disagreeable. You will pardon my candour. My proposed journey to the Rhine (your native place, isn't it?) never came about: my distress had quite knocked me down. Since that, however, some new airy shapes have found their way out of me: one of them I should like to bear your name, *i.e.* I should be glad to dedicate something to you.

"There are some things in my music which you will positively dislike, if I may judge from your former articles; but our new movement cannot fail to be intelligible, as a whole, to such a keen eye as yours, and is sure to meet with your sympathy and help. I seem to feel that we are standing at the beginning of a new time, and that strings might now be touched which have never been heard before. May the future be with it, and some good genius bring it to perfection.

"Good bye for to-day. Send me whatever pearls you have in store. In my manifold occupations I want the assistance of others, and chiefly that of trustworthy men like you.

"Yours truly,

"Robert Schumann."

(6)

"*Leipzig, October* 18, 1836.

"I received with joy everything you mention, and only wish it were more. A biographical sketch of [name illegible] would be particularly welcome to my readers and myself. To judge by one of your former letters, you seem to believe that some of your MSS. are not yet printed, but this is the case only with one—the Dream about the prize symphony; sometimes I look at it with real reluctance. There is so much in it that I like, and yet I think it would do better for any other paper than the *Neue Zeitschrift*, which once for all is devoted to youth and progress. Besides, the symphony of Berlioz has just been so favourably reviewed in our journal that a new and entirely different opinion is more likely to puzzle the reader than to be of any use.

"Hr. Freier's songs are going to be noticed. On the publishers of this place I have no influence whatever. I think it better for Hr. Freier to apply directly to Hofmeister. I have tried myself several times to find a publisher for other people's MSS., but have met with so many refusals that I really don't care to ask any more. You can scarcely believe how sorry I am for being obliged to say this to you, to whom I owe so much.

"Will you be kind enough to go once more through your file of the *Zeitschrift*, and tell me exactly which numbers are wanting. I sent you some time ago separate copies of all your articles; have you received them? A Warsawian composer, Nowakowski, who was here for some weeks, mentioned to me a musical periodical in the Polish language. Could you tell me at all what it is like? Last summer you announced to me a Moscowite friend of yours, but nobody has appeared yet. The musical season here is at its height. Lypinsky is sure to pass Warsaw. I like him very much, both personally and as an artist. I gave your MS. of the poem, 'Die Tonkunst,' to Mendelssohn; he sends his thanks and kind regards; but for the present he cares more for making love to his chosen than for composing. Have you seen the *Papillons*, and the sonata by Florestan and Eusebius? I wish you would let me know your opinion of them at once. You will soon read a comprehensive article about them by Moscheles, who is now in London.* Don't you think it better to give sometimes another form to your contributions? Gottschalk† has become such a dear friend of mine that I should be sorry to miss him; but I am obliged to plead for my readers. Besides, new forms bring new ideas.

"Please ask me to do something for you which is very difficult, otherwise I shall be too light in the balance. I long for news of you; please send me your letters direct by post. New Year is coming on; do you know anything to begin the new volume with?

"Yours, faithfully,

"Robert Schumann."

In order to understand the last letter, it is necessary to state the following facts. The Vienna Kunstverein had promised a prize to the composer of the best symphony. Herr von Zuccalmaglio seems to have been afraid the committee might decide in favour of Berlioz, or a composer of his school, and, to prevent this unpatriotic proceeding, he wrote, under his favourite pseudonym, "Gottschalk Wedel," the dream mentioned in the letter, which, notwithstanding its romantic form, showed a good deal of German philistinism. In it he abuses Berlioz' dramatic symphony, "Épisode de la Vie d'un Artiste," the great merits of which Schumann himself had gladly acknowledged in the article alluded to. His fear, however, proved to be unnecessary, for Lachner, a Munich composer, won the prize. Schumann inserted Z.'s article with a note of his own, in which he entirely disagrees with the views of his friend and of the Vienna committee. Schumann's and Z.'s article may be read now in the former's *Gesammelte Schriften*, 2nd ed. i. 68 and 131.

Fr. Hüffer.

(*To be continued.*)

NOTES.

Herr Nottebohm, the well known Beethoven scholar, publishes in No. 5 of the *Allg. Mus. Zeitung* a newly discovered "Stammbuch," in which, according to the German custom, the young master's friends in Bonn wrote a few kind words of remembrance on the occasion of his leaving his birthplace for Vienna, where he ultimately took lessons of Haydn. The contributions in prose and verse are full of the sentimentality of the time (1792); for the poetical part the works of contemporary poets, and chiefly those of Klopstock and Schiller, had been ransacked successfully. Apropos of his journey, Beethoven is admonished by Count Waldstein "to receive from the hands of Haydn the genius of Mozart."

Liszt's oratorio, *Die heilige Elisabeth*, has been performed by the Liederkranz Choral Society in New York.

The *Musikalische Wochenblatt* says that Dopler's new opera, *Judith*, has just been performed in Vienna with great success. The author is a disciple of Wagner.

Der Haideschacht (*The Mine on the Heath*), a new opera by the Leipzig composer, Franz von Holstein, has been recently performed in Bremen with the same success as it had met with in Dresden and Leipzig. The libretto is derived from a novel of Hoffmann's, and written, after Wagner's example, by the composer himself, who however in other respects seems to be an adherent of the school of Schumann.

Mr. Darnreuter is at present engaged on a translation of Wagner's *Letter to a French Friend*. The musico-philosophical views which are contained in Wagner's voluminous works are here resumed in a lucid and very readable form. The "Letter" will be preceded by a biographical and critical essay by the translator.

* This sonata appeared under the title, "Pianoforte-Sonate, Clara zugeeignet von Florestan und Eusebius," op. 11. Moscheles' criticism on it (dated London, October, 1836) may be found in Wasielewsky's *Life of Schumann*, 1st ed. 320.

† Gottschalk Wedel, the *nom de plume* of Zuccalmaglio, already explained.

Theology.

THE DOGMA OF PAPAL INFALLIBILITY.

II.

Voices from Maria-Laach. [*Stimmen aus Maria-Laach. Die Encyclica Papst Pius' IX. vom 8. Dezember 1864. Neue Folge. Das Oecumenische Concil.*] Herausgegeben von Florian Riess und Karl von Weber, Priestern der Gesellschaft Jesu. Freiburg im Breisgau: Herder, 1868, 1869, 1870.

Even the slight sketch which I have given of the state of opinion among Catholic professors in Germany is sufficient to show the motives for the definition of the papal infallibility. The real question at issue was whether professors of universities were to be allowed to say precisely what they pleased until an Œcumenical Council could be assembled. In other words, was the keeping of the Christian revelation to be entrusted to erudition or to a supernatural gift of infallibility? The composition of the minority is already enough to show that the question is by no means identical with that which was agitated in the last century under the name of Gallicanism. The old doctors of the Sorbonne would have stopped their ears with horror at the notion of "freie Wissenschaft." The real centre of opposition was not Paris, but Augsburg.

I now turn to another of the Maria-Laach series for an explanation of the decree itself. Father Schneemann's treatise on "The Power of Teaching in the Church" contains an able exposition of the whole subject. He begins with a review of the notion of the gift of infallibility, its objects and extent. He then turns to the infallibility of the Holy See as one form of the infallibility of the Church. Of course, what I have hitherto said only proves the usefulness of the gift in checking the autocracy of erudition; no amount, however, of usefulness will justify the decree unless Christ really gave it to the successors of St. Peter. Into this part of Father Schneemann's treatise the space allotted to me forbids me to enter. I turn at once to a portion which gives the key to the meaning of the decree itself; and in doing so I will, as far as possible, use his words instead of my own.

The decree, as is well known, runs as follows:—

"Nos traditioni a fidei Christianæ exordio perceptæ fideliter inhærendo, ad Dei Salvatoris nostri gloriam, religionis Catholicæ exaltationem et Christianorum populorum salutem, sacro approbante Concilio, docemus et divinitus revelatum dogma esse definimus: Romanum Pontificem, cum ex cathedra loquitur, id est cum omnium Christianorum pastoris et doctoris munere fungens pro suprema sua Apostolica auctoritate doctrinam de fide vel moribus ab universa Ecclesia tenendam definit, per assistentiam divinam ipsi in beato Petro promissam, ea infallibilitate pollere qua divinus Redemptor Ecclesiam suam in definienda doctrina de fide vel moribus instructam esse voluit; ideoque ejusmodi Romani Pontificis definitiones ex sese, non autem ex consensu Ecclesiae irreformabiles esse."

What is the meaning of the last words? the startled world cries out: if it be so, what check is there upon the authority of the Sovereign Pontiff? why may he not to-morrow promulgate a totally new faith to be believed under an anathema by all Christians? The question really requires an answer, and involves the whole view of the relation between the Pope and the Church. Of course, I might truly answer that the Holy Spirit could only speak truth by the mouth of the successor of St. Peter. As, however, the Holy Spirit has not promised to the Sovereign Pontiff the gift of inspiration, but of a non-miraculous assistance, it is fair to ask what in the constitution of the Kingdom of Christ is the check upon the promulgation of absolutely novel doctrine. I answer, the check lies in the faith of the Church itself. "One thing is certain," says Father Schneemann, "when the Pope puts out an *ex cathedrâ* pronouncement, that is, obliges the whole Church to believe a doctrine, we know infallibly that this doctrine was revealed and at least implicitly believed ever and everywhere, and is now only afresh and expressly put before us as an article of faith. The Pope, as he is the head, so is he the mouth, the representative, of the Church, the authoritative interpreter of the conviction living in the whole Church. Furthermore, if infallibility belongs to an Œcumenical Council because it represents the whole Church, so infallibility must, by a logical consequence, be attributed to the Pope because he, as the head of the whole Church, and possessing the plenitude of ruling power over her, also represents the whole Church, and therefore authoritatively expresses her faith. Thus far we may say that the Pope, as often as he speaks *ex cathedrâ*, speaks in the consciousness of the faith of the whole Catholic Church. Still we must take care not to set up this property of an *ex cathedrâ* decision as a note to know it by. We must not withhold our adhesion to an *ex cathedrâ* decision on the ground that the Church had not previously, by an act of assent, recognised it as her faith, or until she shall have subsequently so assented to it. The theory according to which a man would so act is, in point of fact, Gallicanism. Even before such an assent of the Universal Church, and independent of it, we know from the mere fact of the papal decision as such, that all which it defines agrees with the faith of the Universal Church, and that the Church will assent to the definition, not only because it is its duty to do so, but also because in the papal decision it sees only the infallible expression of its own conviction. Thus the ultramontane view, according to which the papal decision, *ex cathedrâ*, expresses with undoubted certainty a Catholic doctrine, that is, something which has been ever and everywhere believed, supposes the most intimate reciprocal intercourse between the Pope and the Church. As the Pope draws out of the great fountain of the Faith of the Church, and only defines it, so on its side the Church believes unconditionally the decision of its Head. In this process there is an outflowing and reflux of the stream of the same faith and life from the Head to the Body of the Church and from the Body to the Head."

This is an important passage, which throws a great light on the decree. In the process of a decision *ex cathedrâ* we must carefully distinguish the norm according to which the Pope judges, and the subsequent conduct of the Church in its acceptance of his decision. The question which the Sovereign Pontiff asks himself is, what is the doctrine of the Church? I am quite aware that the formation of his judgment is by no means a mechanical operation. The doctrine of the Catholic Church is not contained in a number of written formulas. If it were so there would be need neither of Church nor Pope. It is written in the hearts of two hundred millions of men. Out of its inexhaustible system arise new questions touching on every possible department of human morals, science, and politics. To conceive in proper thoughts and to express in proper words the faith of the Church is a work of the intellect, and therefore requires a special promise of our Lord that the gates of hell shall not prevail against the rock of Peter. But to say that on account of this gift the Pope can arbitrarily impose what he pleases on the Church is simple nonsense. To hold up a lie before the faces of hundreds of millions of men, and tell them that this is conformable to what they have always believed, would be a hopeless enterprise indeed. The Catholic doctrine is something perfectly definite and known. We have no esoteric doctrine. The whole is known to the Irish apple-woman as it is to the Archbishop of Westminster. The most abstruse notional question has something of the real in it. The mob of Alexandria no doubt had but a dim view of the meaning of personality, but it knew quite well what was involved in Mary's being the Mother of God. The old

Irishwoman probably never heard of Gallicanism, but she has wit enough to see that the Pope, being the divinely appointed centre of unity, must be infallible, else the living Church would be bound to the dead, and the infallible Church might have a Head which, as such, could speak lies. I should, as a matter of curiosity, have liked to see her feelings supposing the opinion of the minority had prevailed, and the Council had decreed that the Pope could, in his capacity of Head of the Church, make a mistake, and, for instance, define Protestantism to be true. Of course this is absurd; but the violence of the absurdity is the measure of the impossibility of imposing on the Church what is in opposition to its faith. It was for this reason that in the Council by far the greater part of the minority laid stress on the inopportuneness of the definition, and dared not attack the doctrine. All knew the utter hopelessness of imposing on the Church the belief that the doctrine was false. The impossibility could be seen and felt. The whole Church already believed in the infallibility of the Pope. Precisely in the same way the Sovereign Pontiff could not, if he wished it, impose on the Church the belief, for instance, that the Blessed Virgin is the fountain, not the channel, of grace. His gift of infallibility prevents his imposing it, and the faith of the Church is a second obstacle, which "makes assurance doubly sure." The universality and perfect definiteness of the Catholic belief would be sufficient to preserve the Church from arbitrary decisions. They are impossible supernaturally and naturally.

The infallibility of the Pope is no doubt supernatural, but its exercise, even looked at as a matter of ecclesiastical constitution, cannot be wanton or arbitrary. The gift of infallibility does not mean the power of promulgating any opinion whatsoever. You might as well say that the gift of impeccability, supposing that it were conferred on a being, would mean the liberty to commit all sin, on the ground that whatever sin he committed would *ipso facto* become virtue. As the strong foundations of morality would not be shaken, but exhibited, by the gift of sinlessness, so the unchangeableness of the faith at once guarantees and finds its expression in the infallibility of the Sovereign Pontiff. We need not fear: the steadiness of the Rock can only steady, not shake, the Church. The gift of infallibility means a divine promise that the Pope will always decide in accordance with the Catholic Faith; how does this render his decisions arbitrary?

What, however, is the meaning of the last words of the decree, that "the definitions of the Roman Pontiff are irreformable in themselves and not by virtue of the consent of the Church"? They mean that from the *ex cathedrâ* decision there is no appeal; and that, consequently, Catholics are bound to receive it at once without waiting for the consent of the Church. It is perfectly plain that, if they could thus withhold their assent, the very notion of infallibility would be nugatory. Let me take the case of this very Vatican Council which has passed the decree. One of the reasons alleged for withholding assent to its definition is this very principle, that for its validity as an Œcumenical Council the assent of the Church to its proceedings is necessary. The theory is expressly held by a celebrated German theologian that a council is only infallible by virtue of the subsequent consent of the Church. Is it not plain that this is practically denying its infallibility? A man may on this principle withhold his submission to an Œcumenical Council for an indefinite period, as we see that in point of fact the authority of the Vatican Council, which is as plainly œcumenical as any ever held in the Church, is denied on that very account. That the consent of the Church will follow—nay, has already followed—is certain; but the Council was œcumenical before the consent. The same thing is true of the infallibility of the Sovereign Pontiff. Whenever a Pope has put forth an *ex cathedrâ* decree, the Church has ever recognised her own faith. That decree may have been a new judgment, but the Church has seen that it was implicitly contained in, or conformable to, the faith. She has ever said in effect: this reflex judgment is in complete accordance with my intuitive belief. She receives the decree at once because she knows that the Pope cannot make a mistake, but in accepting it she sees that it is no ways contrary to her faith. Previous, however, to her consent the decree was, according to the Council, irreformable—that is, without appeal.

In conclusion, I can strongly recommend the labours of the fathers of Maria-Laach to all who wish to get in a short space a view of the bearings of the celebrated Encyclical. Father Schneemann's pamphlet on the "Honoriusfrage" is one of the very best in the weary controversy. The Fathers have also undertaken, under the title of *Collectio Lacensis*, a continuation of Hardouin, bringing the councils down from the Council of Trent to the present time. The first volume has appeared, and no great library should be without the collection.

J. B. Dalgairns.

Notes and Criticisms on the Hebrew Text of Isaiah. By the Rev. T. K. Cheyne, M.A. Macmillan and Co., 1868.

These *Notes and Criticisms*, which examine about fifty more or less obscure passages in the Book of Isaiah, form a valuable contribution to the more scientific study of the Old Testament. Their merit consists not so much in the novelty of the critical conclusions as in the thoroughness of the investigation and the originality of not a few of the arguments. The sharpness with which, according to the preface, the author proposes to keep philology distinct from exegesis cannot fail to obtain the applause of all competent judges. He has also devoted a commendable degree of attention to the improvement of the text with the help partly of the ancient versions, partly of conjecture. The hope expressed in the preface (p. vi) that very old MSS. may yet be discovered may easily be disappointed; but it must be remembered that the value of MSS. depends less upon their age than upon the accuracy of the copyist, and still more upon that of the correctors. As regards the versions, that of the LXX has many grievous defects; but it has the merit of dating from a time when the text had not yet petrified under the superstitious though conservative care of the Rabbis. Mr. Cheyne's new MSS. matter is interesting, though, as might have been expected, the critical results are inconsiderable. It comprises an original though of course partial collation of Saadiah's Arabic translation of Isaiah, and also of a MS. Hebrew-Arabic Lexicon by the Karaite David Ben Abraham, both preserved in the Bodleian Library.

We mention some of Mr. Cheyne's best and most original points. The remark is new that מֻת in an earlier stage of the language meant "hero," just as גֶּבֶר in the later Hebrew comes to be quite synonymous with בֶּן־אָדָם. It is clearly shown also that עַלְמָה (vii. 14) is generally used of an unmarried woman. Recent expositors have made too much of the etymology, in opposing the Messianic interpretation. Much light is thrown by the remarks of Mr. Cheyne upon the difficult passage, viii. 19-23. We quite agree that בעד in verse 19 cannot stand for תחת; but we do not quite see that אם לא must have an asseverative force. Our author renders the difficult words in xviii. 1, "the land of the whizzing of wings," "the musquito and tsetse-flies which abound on the banks of the Nile being taken as emblems of the enterprising Æthiopian warriors" (p. 21). But the dual כְּנָפַיִם seems to suggest rather the division of the branches of the river

between which Meroe lies; thus the phrase would mean "the land of the murmuring on both sides." The author's philological acuteness and sobriety is very strikingly shown in his note upon xxiii. 13, where, among other alternative conjectures, *e.g.* those of E. Meier and Olshausen, he suggests that the entire verse may be misplaced, and have belonged originally to an oracle against Babylon; in this case "we should have to read מְרֵי יְסַרְתָּהּ; comp. a strikingly similar description in xiii. 17-22" (p. 24). In xxviii. 10, the difficult word צו is ingeniously accounted for as an abbreviation, taken from the popular dialect, and identified with מצוה. We had marked other passages for commendation, especially the note on חנף, pp. 13-16, but the above may be sufficient for a sample. A review of Mr. Cheyne's more popular work upon Isaiah will appear shortly. We are sure that many of his remarks in the present pamphlet will in the course of time find their way into the best commentaries. L. Diestel.

Contents of the Journals.

The Contemporary Review for February contains a slight but graceful sketch of the late Dr. Alford, as a scholar and an ecclesiastic, by Dean Stanley, supplemented by some biographical details by the Rev. E. T. Vaughan. The time for criticism, as both writers naturally felt, has not yet arrived; we can but deplore the loss of one whose industry was so indefatigable, and whose scholarship so truly progressive. We may be allowed, however, to follow Mr. Vaughan in describing the labours of Dr. Alford as essentially preparatory. He saw that a pioneer in the critical study of the New Testament was required, and he deliberately accepted the position. "The work which he did in making those critical and exegetical helps, which had hitherto been the property in England only of a few readers of German, to become the common heritage of all educated Englishmen, was a work which no other man of his own generation could have achieved equally well, or was likely to have attempted."

The **Theologisch Tijdschrift** for January opens with a suggestive paper by Professor S. Hoekstra, based on two works, by Herr Seinecke, on Job and on Isaiah xl.-xlvi, and maintaining—1. That the hero of Job is not an individual, but an impersonation of the suffering people of God; 2. That Job is a distinct imitation of the servant of Jehovah in Isaiah xl.-lxvi.; and 3. That the description of the latter is based on Jeremiah's description of his own sufferings. Herr Seinecke's work on Isaiah (Der Evangelist des Alten Testaments; Leipzig, 1870), and Prof. Hoekstra's review, deserve the most careful perusal, though the problems suggested by what may be called the Jeremianic literature have, we think, not yet received a satisfactory solution.

The **Zeitschrift für wissenschaftliche Theologie**, 1871, No. 2, contains four important articles:—1. By Prof. Pfleiderer, On the Pauline πνεῦμα ("What is the relation of the new πνεῦμα of the Christian to that of the natural man?").—2. On the Christ of Paul, by Prof. Hilgenfeld. [*Inter alia*, a refutation of Baur's view that Philippians contains an un-Pauline Christology.]—3. Emendations of Exodus, on the basis of LXX, by C. Egli. [Occasioned by the critical defects of Knobel on Exodus.]—4. The Epistle of Barnabas in an old Latin version, by Prof. Hilgenfeld. [With variants from the Petersburg MS.] —Among the books noticed is Sinker's The Testaments of the XII Patriarchs. [Not unfavourably, though from an opposite point of view to the author.]

The **Studien und Kritiken**, 1871, No. 2, contains a reply by the Rev. A. H. Sayce to a paper by Prof. Schrader on Sargon and Shalmaneser.

The North American Review for Jan. contains the most competent review (by Prof. Whitney?) of Cox's Aryan Mythology which we have yet seen. It describes the author as deficient in the power to distinguish between the probable and the improbable in Max Müller's conjectures. Cox's etymologies are untrustworthy, especially when, as in the case of Consus (vol. i. p. 347, note), they are original. He is also inconsistent in his interpretations of myths. But "under and along with the exaggerations we, for our part, are confident that there is a great deal which is solid and valuable."

Contributions to the Theory of Natural Selection. By Alfred Russel Wallace. London: Macmillan and Co., 1870.

Amongst the immense number of writings which the publication of Darwin's *Origin of Species* has called forth, the present work is noteworthy in more than one way. Mr. Wallace arrived at the theory of natural selection contemporaneously with Mr. Darwin, but independently of him. This collection of ten essays, published between the years 1855 and 1870, is interesting not only in their relation to the great theory, but also from the light which they throw on the gradual development of a remarkable man.

The first essay is headed "On the Law which has regulated the Introduction of New Species." It is worth remembering that this essay was written in Borneo; whilst it was in South America that Darwin, as he himself says, first came face to face with the great problem the solution of which has been the work of his life, and which has exercised such a fruitful influence on the whole of human thought. It is also worth noting that both enquirers received their first impulse towards a successful solution of the problem from Malthus's celebrated work *On Population;* and doubly interesting again is it to see how the great idea has worked itself out in its two principal representatives, until they culminate in very divergent results—an example ready to hand of the Darwinian law of the divergence of character.

The law which, according to Wallace, has regulated the introduction of new species, is as follows:—"Every species has come into existence coincident both in space and time with a pre-existing closely allied species." In this primitive and indeterminate form, it is difficult as yet to recognise the clear apprehension of the principle of natural selection arrived at some years later: but still it takes its stand in the most definite manner on the basis of the theory of descent, which had been so completely stamped out since the time of Lamarck. It claims, indeed, "a superiority over previous hypotheses (and therefore especially over that of Lamarck), on the ground that it not merely explains but necessitates what exists; granted the law, and many of the most important facts in Nature could not have been otherwise, but are almost as necessary deductions from it, as are the elliptic orbits of the planets from the law of gravitation." There is a firm ring about this statement, very different from the timid asseveration of most of the naturalists of that time, for whom all enquiry into the origin of the wonderful manifoldness of the organised world was an attempt to transcend the limits of human knowledge, and for whom the efforts of Lamarck and Geoffroy St. Hilaire, even of Goethe, were only matter for a shrug or a smile. It required considerable boldness to undertake a problem, regarded at that time by almost every one as unscientific, beneath the tropical sun of the Sunda Islands; it was only three years later, however (a year before the publication of Darwin's *Origin of Species*), that the second essay of this collection was written at Ternate, "On the Tendency of Varieties to depart indefinitely from the Original Type," opening a vista of new and undreamt-of relations between phenomena not hitherto understood.

It is this essay which Wallace sent to Darwin to be read before the Linnean Society, and which Darwin gave to the world side by side with the results of his own prolonged researches. The close *rapprochement* between this essay and the *Origin of Species*, which appeared soon afterwards, may be seen by a comparison of the titles of the various sections of the former with the facts and considerations that form the basis of the latter. As these two essays form together the one fountain-head from which the theory of natural selection

has flowed, so we may recognise side by side with the mighty development of Darwin a perfectly independent position for Mr. Wallace.

After his return to England in 1862, our author occupied himself with the working-up of the extensive material which he had collected, as well as with the development, and especially with the defence, of the new theory. As the first-fruit of this work we have the essay dated March, 1864, "On the Malayan Papilionidæ or Swallow-tailed Butterflies, as illustrative of the Theory of Natural Selection," the fourth in this series. This essay is a model of weighty and acute research. From the apparently unimportant theme which the history of a family of butterflies supplies, we are led on, step by step, through definition of the word species, laws and modes of variation, the occult influence of locality on form and colour, phenomena of dimorphism and mimicry, the modifying influence of sex, and general laws of geographical distribution, to indications of previous changes in the surface of the Earth. The third and seventh essays show how, on the theory of natural selection, the colour and marking of animals are phenomena subject to law. The third, "On Mimicry and other Protective Resemblances among Animals," and the seventh, "A Theory of Birds' Nests," showing the relation of certain differences of colour in female birds to their mode of nidification, open a new field of biology, as well for laymen as for trained enquirers.

"Creation by Law" (the eighth essay) is a critical essay, or rather a rejoinder to the criticism of the Duke of Argyll, and to an article on his *Reign of Law* which appeared in the *Times*, and which contained a number of ridiculous statements about the theory of natural selection. The Duke's argument was that the harmony and beauty of creation is so perfect, as to be inexplicable except upon the hypothesis of a constant supervision and direct interference of the Creator; and, as Mr. Wallace says, is a fair representation "of the feelings and ideas of that large class who take a keen interest in the progress of science in general, and especially that of natural history, but have never themselves studied Nature in detail, or acquired that personal knowledge of the structure of closely allied forms which is absolutely necessary for a full appreciation of the facts and reasonings contained in Mr. Darwin's great work."

We have at present concerned ourselves only with those essays in which the principle of natural selection is employed by the author as the *ultima ratio* of all explanation of organic nature. But the volume contains four additional essays, in which the author strikes out another path, and maintains with great emphasis that there are very important facts in Nature for whose explanation this principle does not suffice, and will never suffice. These essays are entitled (5) "On Instinct in Man and Animals;" (6) "The Philosophy of Birds' Nests;" (9) "The Development of the Human Races under the Law of Natural Selection;" and (10) "The Limits of Natural Selection as applied to Man." Of the time of the composition of the first of these essays we are not informed; the second and third were written in 1867, but the third contains some very important modifications in the present reprint; the fourth is new, and contains, in the author's own words, "the further development of a few sentences at the end of an article on 'Geological Time and the Origin of Species' which appeared in the *Quarterly Review* for April, 1869."

The essays on instinct in man and animals, and on the philosophy of birds' nests, contain not unimportant deviations from the 7th chapter in Darwin's *Origin of Species*, in which instinct is discussed also in its relation to the theory of natural selection. Darwin saw in this question one of the greatest difficulties of the theory; since he is not satisfied to name in a general manner those cases in which the heredity of instincts is indisputably carried out, but has brought forward special instances from the life of ants, which are in fact excessively difficult to harmonise with the theory of natural selection. We cannot here allow ourselves to discuss whether Darwin has successfully conquered this difficulty, or at least has pointed out the way in which it may hereafter be overcome; it only interests us at present to note that Darwin insists on the direct transmission of complex instincts. He says, for example: "We can understand, on the principle of inheritance, how it is that the thrush of tropical South America lines its nest with mud in the same peculiar manner as does our British thrush; how it is that the hornbills of Africa and India have the same extraordinary instinct of plastering up and imprisoning the females in a hole in a tree, with only a small hole left in the plaster through which the males feed them and their young when hatched; how it is that the male wrens (Troglodytes) of North America build cock-nests to roost in, like the males of our kitty-wrens, a habit wholly unlike that of any other known bird." Wallace, on the other hand, sets aside the view that all instincts are congenital, and thus brought about by inheritance, and maintains that all phenomena of this kind may be explained either from the instruction of the young by the parents or by some other kind of earlier experience. He is also of opinion that much of what is ordinarily called instinct is the result either of organization or of habit. If the newly born calf can walk from the moment of its birth, this is a consequence of its organization, which makes walking both possible and pleasant; if we ourselves stretch out our hands in order to protect us from falling, this is an acquired habit which the child does not possess. It seems therefore extremely difficult to say what is the difference between an act of instinct and an act which follows the necessities of organization. When Wallace defines instinct as "the performance of complex actions by an animal, absolutely without instruction or earlier acquired knowledge," and from this attempts to prove that it is not present either in the case of cell-building bees or nest-building birds, or at least cannot be proved by observation, we may adduce, on the other hand, all those cases where the completion of such "complex acts" as Wallace never had in his mind are evident, and yet all possibility of instruction and experience is excluded; and the alternative of an organic force, as Wallace appears to understand it, or of an acquired habit, also appears inadmissible. Such an instance is furnished in another place by Mr. H. Higgins, who adduces the case of the young of an Epeira, which, separated from their parents, after a comparatively short time, constructed the same elaborate web which the parents had made, and thus formed their own erection without observation of the act of construction of the parents or instruction from them. How, again, can we explain the following fact, which I have very often observed, and which any one may verify for himself? It is well known that the larvæ of the caddice-worm live in water, and build around the tender hind part of their body a house constructed of all kinds of vegetable, mineral, and even animal materials, bound together by spinning-threads. During my studies of insect-embryology, I have often examined the eggs of these caddice-worms, which are found in clusters wrapt up in a gelatinous mass on water-plants, and have hatched the eggs myself in a small aquarium. After the lapse of a few days, the larvæ begin to glue together a protecting ring of little pieces of leaf, which they bite off for that purpose, and then gradually enlarge it, until it covers like a tube the whole of the hinder part of the body, and increases in length with that of the animal. The construction of such a tube appears perfectly analogous to

the building of nests by birds; and here it is as little admissible to suppose any instruction, or any learning by experience, as it is to attribute the building of the tube about the hinder part of the body to an organic necessity. While it is indisputable that in other instances instruction, experience, and imitation may be of considerable and indeed of unique importance, these great and important questions must nevertheless be allowed to remain open ones; and thus naturalists and laymen become interested in their solution. And to this end these essays of Wallace will give a great and healthy impulse.

The question of the relation of so-called instincts to the complicated process of natural selection leads us to the last two essays in the volume, the relationship of man, and of his corporeal and spiritual nature, to the principle of natural selection.

(*To be continued.*)

Scientific Notes.

New Geographical Explorations.

From *Petermann's Mittheilungen* we learn that Dr. Nachtigal, the bearer of presents, in acknowledgment of services rendered to the German travellers Barth, Vogel, von Beurmann, and Rohlfs, from King William of Prussia to the Sultan of Bornu (a district round Lake Chad in Central N. Africa), arrived safely at Kuka, its capital city, on the 16th of July last year,* after a long delay at Murzuk, and a perilous journey across the Sahara in the hot season. Among the other gifts a harmonium had suffered so much from the heat and dryness as to be able to produce only the most dismal discords.

Of still greater interest is the intelligence that in December the Russian steam corvette "Witiaz" left Europe in charge of the explorer Nicolaus von Miklucho-Maclay, for a seven or eight years' cruise among the islands of the Pacific, the first two of which are to be devoted entirely to the survey of the rich island of New Guinea or Papua (three times the extent of Great Britain), one of the most completely unknown parts of the earth, never traversed by any European, though its coasts were discovered nearly 350 years ago.

From Aden the well known traveller Richard Brenner writes that his expedition would leave that place for Zanzibar on the 1st of December, thence to proceed again to the further exploration of the Juba, Dana, and Ozi rivers, and afterwards to move southward towards Mozambique and Madagascar. In Aden Brenner met with the leaders of a French expedition, fitted out in two steam-vessels by the Maison Roux of Marseilles, also on the point of starting for the river Juba and its neighbourhood.

In South Africa the survey of the districts of the gold and diamond fields is proceeding with the greatest activity, and new chartographical materials of the highest value are constantly arriving from the discoverers there, Mohr, the geologist Hübner, Baines, Erskine, Forssman, Moodie, Jeppe, and Merensky.

Physiology, &c.

Ciliary Movement.—In the *Biologische Studien*, his latest contribution to scientific literature, Professor Haeckel gives the result of some highly important observations on the nature of ciliary movement. The most recent investigations on this subject, viz. those of Dr. W. Engelmann (*Jenaische Zeitschrift*, 1868, vol. iv. p. 321), as also the earlier ones of Dr. M. Roth (*Virchow's Archiv*, Bd. 37, p. 184), have shown that physiologically the ciliary is much more nearly related to the amœboid movement than to the muscular. Professor Haeckel's observations show that the ciliary movement is merely a modification of the amœboid movement of protoplasm. Ciliated cells are of two kinds. In the one kind (epithelium flagellatum) each cell is provided with a single long flagellum or lash—sponges possess only this kind; in the other (epithelium ciliatum), numerous hair-like appendages take the place of the flagellum. This is the kind found in most of the higher animals. The old notion, that in ciliated cells the cilia are attached to the outside of the cell membrane must now be considered as entirely set aside. Many, probably most, ciliated cells are destitute of a membrane, and the appendages, whether flagella or cilia, are direct processes of the protoplasm of the cell. Prof. Haeckel's observations on lower organisms during the last year have led him to the conclusion that ciliated cells arise directly by the transmutation of amœboid cells. This transmutation he has observed in the case of the motus flagellaris, in Monera, such as *Protomyxa anurantiaca*, and *Protomonas Huxleyi*. The swarm spores of these species, when they leave the parent cyst, are pear-shaped, with a single long hair-like flagellum, by the lashing movement of which they swim about. After a time they settle, whereupon the flagellum becomes an amœboid process. These are merely eytods, but the same phenomenon has been observed in the case of swarm spores with a nucleus, *i.e.* real cells, and described by De Bary, in his monograph of the Mynomycetæ. The same thing was seen in the epithelial cells of sponges of the order Leucoselearia by Prof. Haeckel, whilst at Bergen, in Norway, in August and September, 1869. But by far the most interesting observations of the Professor on this subject are those made in the Canary island Sanzerote. Here he has been able to observe the direct origin of the motus ciliaris from amœboid protoplasmic movement, first, in the spherical masses arising from the division of the egg in the Siphonophora; secondly, in a new and very remarkable form which he has discovered, and which he calls *Magosphaera Planula*, and considers to represent a new and separate group of the kingdom Protistæ. This creature has a ball-like body, consisting of pear-shaped cells, bedecked with many cilia. These ciliated cells not only can be seen to develop out of amœboid cells, but also subsequently to resume that condition. For after the ciliated ball has swum about for some time, its component ciliated cells separate from one another, and gradually pass into an amœba form. These observations of Prof. Haeckel are not only of importance as confirming physiological results, but also of classificatory value, as showing that their possession of cilia, as opposed to the exhibition of an amœboid movement, must not any longer be considered as a ground for placing the Infusoria in a separate group.

Physiological Effects of Exposure to Increased Atmospheric Pressure.—Most people are aware that certain disagreeable sensations are experienced by the inmates of a diving-bell, during its descent, even to a few feet below the surface of the water, but the opportunity seldom occurs to note the effects produced by a descent to so great a depth that the pressure amounts to four atmospheres, or no less than 60 lbs. on the square inch. Yet exposure to this pressure has been experienced by the workmen engaged in laying the foundations of the piers of the St. Louis bridge over the Mississippi, and Dr. John Green has published in the *Transactions of the American Otological Society* the results of some observations he has recently made. It was found necessary to use considerable precaution in admitting the workers into the chamber containing the condensed air; an intermediate chamber or lock was therefore constructed, into which the condensed air could be admitted gradually, occupying, for the higher degrees of pressure, from five to ten minutes. The exit was through the same lock, and occupied the same time. The increased oxidizing power of the condensed air was shown by the rapid wasting and guttering of the candles, which burned with a streaming smoking flame, and, when blown out, rekindled spontaneously from the glowing wick. During the later stages of the work the men could only work for an hour at a time, and a remarkable form of palsy was prevalent, from which nearly a dozen men died. The first effects of the gradually increasing pressure in the lock were a distinct sensation of pressure upon the tympanic membranes of both ears, which, however, was immediately relieved by swallowing, or by inflating the ears from within. The respiration and cardiac movements remained unaltered until exertion was made, when they quickly became accelerated. It was found to be impossible to whistle. The ticking of a watch was heard with great distinctness. On leaving the chamber a strong sensation of cold was experienced, and catarrhs were frequent amongst the men. The condensed air escaped from the tympanum through the Eustachian tube in a series of puffs. Too sudden exposure to the condensed air in one instance caused rupture of the membrana tympani, and too sudden removal of the pressure in the same person spitting of blood.

The Aëroconiscope.—The lectures of Dr. Tyndall on dust and on the impurities of water have led to much discussion as to whether the particles of organic nature (as indicated by their destruction when exposed to heat) are the germs of the lower forms of animal and vegetable life, or are merely dried and floating fragments of dead organisms that have been taken up and are in course of transportation by currents of air. To determine this point, we may resort to microscopical analysis, or we may adopt a still more satisfactory method, namely, that of cultivating the germs upon a proper soil, and Dr. Maddox has just read a paper before the Royal Microscopical Society, in which he gives the results of his investigations with an instrument to which he has applied the term Aëroconiscope. This consists of a small chamber open at one side, on the floor of which a small quantity of treacle mingled with acetate of potash and water is spread, and which is placed on a base revolving with the set of the wind, so that the opening is always directed

* The letters announcing this were received in Gotha on the 25th of December.

windward. The results obtained have been interesting, for he found that there was no relation between a prevalence of the germs and the direction of the wind from any one point of the compass more than another. The amount of spores collected varied from 250 on a cultivating surface of ⅛ inch to a very few. The prevailing spores were pale, olive-coloured, and oval. Some commenced germinating on the second day; others not before the twentieth. No attempt is made to name them, but they appear to be chiefly the spores of Fungi. By far the largest proportion of the collections was made during the months of July and August.

The Power of Numerical Discrimination.—Prof. W. S. Jevons has a very interesting article on this subject in *Nature*, No. 67, for Feb. 9. Sir William Hamilton had maintained, in support of Ch. Bonnet and Destutt, that the mind had the power of grasping as many as six distinct objects at once, while Abraham Tucker limited the number to four. Prof. Jevons considers the lower number to be nearer the truth. By throwing a number of uniform black beans, fewer than 16, into a round white box standing in a black tray, he estimated the number which fell into the box at the moment of their coming to rest. Three and four he found were always estimated correctly; with five there was an error amounting to about 5 per cent. of the number of trials, which gradually increased with higher numbers up to 15, when only two out of eleven trials were correctly estimated. From a statistical table of the results, he calculated the empirical law for error to be—

$$\text{error} = \frac{n}{9} - \frac{1}{2},$$

n being the real number. The limit of complete accuracy, if there were one, would be neither at four nor five, but half-way between them.

Geology, &c.

Fossil Birds, Reptiles, and Batrachia of America.—The second part of Prof. Cope's *Synopsis* has appeared. The author's design is to describe only those species and types which are new, and those portions of imperfectly known forms which will throw additional light on their relations and affinities. In the course of his investigations extending over six years, he has arrived at the following general conclusions:—1. That the Dinosauria present a graduated series of approximations to the Birds, and possess some peculiarities in common with that class, standing between it and the Crocodilia. 2. That serpents exist in the Eocene formations of America. 3. That the Chelydra type was greatly developed during the American Cretaceous period, and that the Reptilia of the American Trias belong to the *Belodon* type.

Vertebrate Remains from the Newcastle Coal-field.—In the *Annals and Magazine of Natural History* for February, Messrs. Hancock and Atthey record the occurrence of a mandibular ramus of *Anthracosaurus Russelli* from the ironstone-shale of Fenton, in the Newcastle coal-field. This Labyrinthodont was first described by Prof. Huxley in 1862, from a specimen obtained in the Lanarkshire coal-field. The authors furnish notes on another Labyrinthodont, *Loxonema Allmanni*, also from Fenton, and on a large fish, *Archichthys sulcidens*, from Newsham.

Tertiary Shells of the Amazon Valley.—Recent explorations by Prof. J. Orton and Mr. Hauxwell have determined the occurrence, on the borders of the Amazons, at Pabos and Cochaquinas, of Tertiary deposits yielding numerous shells. The species indicate fresh- or brackish-water conditions, and their perfect preservation indicates a quiet lake or estuary. These deposits are noticed, and the shells, which include two new species, are described by Mr. Henry Woodward in the *Annals and Magazine of Natural History* for January and February. The papers are illustrated by a capital plate of the fossils. Mr. Hauxwell's discovery proves that the estuary of the Amazons was once more than 2000 miles above its present position.

Faunas of the Red Sea and Mediterranean.—The results of a dredging excursion in the Gulf of Suez, undertaken in the spring of 1869, by Mr. MacAndrew, were published last December. Three hundred and fifty-five species, many of them new to science, have been added to the Red Sea fauna. Further researches only tend to confirm the distinction between the Red Sea and Mediterranean species of Mollusca, so that a barrier between the seas must have existed from very remote time. This, however, is quite consistent with Prof. Issel's statement, that an examination of the geological conditions of the isthmus leads to the conclusion that the two seas were united during the Eocene and Miocene periods.

New Form of Terebratulid.—Professor W. King describes in the February number of the *Annals of Natural History* a curious new genus of Terebratulidæ, which is remarkable for having its beak pointed, and not foraminate at the apex; in this respect, as in general form, presenting a resemblance to *Rhynchonella*. In the character of the loop it agrees with *Terebratula vitrea*; and the shell has the branching tubulation characteristic of *Terebratulina Caput-serpentis*. The species was obtained in rather deep water on the Agulhas Bank, and is described by Professor King under the name of *Agulhasia Davidsonii*.

Physics and Chemistry.

Influence of Intense Cold on Steel and Iron.—The correctness of the popular idea (strongly encouraged by railway companies) that intense cold renders iron and steel more brittle, and may hence occasion the fracture of the tires of wheels during severe frost, which has caused many deplorable railway accidents, has long been doubted by practical physicists. The subject has now been again investigated; and from some papers read at a recent meeting of the Manchester Literary and Philosophical Society (and published in *Nature*, No. 65, Jan. 26) by Sir W. Fairbairn, Dr. Joule, and Mr. Spence, it would appear to be satisfactorily determined that a low temperature has no effect in rendering iron more brittle. Dr. Joule's experiments were particularly decisive, and consisted of applying weights suspended from the middle of steel needles at different temperatures, and letting the blunt edge of a steel chisel fall on cast-iron nails under similar circumstances. His general conclusion is that frost does not make either iron (cast or wrought) or steel brittle; and that accidents arise from the neglect of the railway companies to submit wheels, axles, and all other parts of their rolling stock, to a practical and sufficient test before using them.

Henderson's Patent Process for Refining Cast Iron.—We gave recently (see *Academy*, vol. ii. p. 72) an account of a new process for the production of steel by the partial decarburization of cast iron, invented by Mr. James Henderson, of New York. From *Nature*, No. 64, Jan. 19, we condense the following account of a process invented by the same authority for refining cast iron. The agents used are fluorine and oxygen combined. The fluorine is derived from any fluoride, and the oxygen from any substance containing, or capable of evolving, oxygen; fluorspar and pure rich iron ores are the most available and economical substances, and are applied finely powdered and mixed. The most economical mode of application is to treat the cast iron in the condition in which it flows from the blast-furnaces, with fluorspar and iron ore applied in the "chills," or pig-moulds, used at blast-furnaces, by being spread over the bottom of the moulds. The iron, when tapped from the blast-furnace, flows into the mould thus prepared; the heat of the iron causes fluorine and oyygen to be liberated; and, by reason of the affinities of these substances for silicon and phosphorus, these impurities are removed in the form of vapour. The reactions in the "chills" are similar to those of the boiling puddling process, and last about five minutes. The metal during this period is covered with jets of flame and smoke. The resulting metal, with respect to silicon and phosphorus, is as pure as wrought iron. The advantages claimed for this process are:—1. Better quality, due to the purity of the refined metal. 2. Less skill required to work it, and greater certainty of the quality of the product. 3. Large saving in the cost of production. 4. Saving of fuel per ton of iron, to the extent of one-half. 5. Reduction of general business expenses. 6. Reduction of wages to the extent of 40 per cent. per ton of iron. 7. The puddling-furnace cinders, when smelted, produce better qualities of pig iron.

A New Deodorizing Material.—In the discussion which followed the reading of a paper, by Prof. Frankland, on the growth of Fungi in potable water, before the Chemical Society, on Feb. 2nd, Dr. Voelcker alluded to his discovery of the use of pulverised or spongy iron as a deodorizing material of greater potency than animal charcoal. Sewage-water passed through a filter of this substance is completely purified, a much smaller quantity of the substance being required than in the case of animal charcoal; and this filtered water, after having been kept six months protected from the air, remains perfectly sweet, no trace of fungus-growth appearing in it. The spongy iron is obtained by calcining a finely divided iron ore with charcoal.

History.

Historicorum Romanorum Relliquiae, disposuit recensuit praefatus est Hermannus Peter. Volumen prius. Lipsiae, in Aedibus B. G. Teubneri, 1870.

The collections which have hitherto been made of the Fragments of the Roman historians extended only to the end of the Republic and the first beginning of the Empire. The characteristic advantage of the present work of the learned editor of the *Scriptores Historiae Augustae* (son of the author of the Roman history) is that it includes the Fragments of the historians of the Empire. These we are to expect in the second volume of the work: the contents of the present being restricted to the historical area already traversed by others, but possessing an interest of its own. The materials with which it deals have for more than three centuries, since the first work of this kind appeared (Ant. Riccoboni Rhodigini *de Historiâ Liber cum Fragmentis Historicorum Veterum Latinorum*, &c., Venet. 1568), been repeatedly published, and especially as an appendix to the editions of Sallust, and even the last few decades have produced two similar collections. These, however, as Herr Peter very justly remarks in the beginning of his preface, are inadequate to the historical and critical purposes for which they are required. One of these, Aug. Krause's *Vitae et Fragmenta Veterum Historicorum Romanorum*, Berlin, 1833 (not 1853, as Herr Peter's printer has it), is destitute at once of critical acumen as of textual ἀκρίβεια, not to mention the necessary critical apparatus. This last was at that time not attainable in any complete shape, and the want of it constitutes a defect in the second of these editions made by the lamented Professor C. L. Roth, of Basel, which forms the principal part of one of the numerous editions of Sallust, which we owe to Herr Franz Dorotheus Gerlach, Basel, 1852 (not, as Herr P. again wrongly prints, 1853). This collection has no literary or historical introduction, is carelessly arranged, and has the further inconvenience of giving only Latin translations of the Greek documents.

In framing his very complete introduction on the literature and the history of the Fragments, our author has also made careful use of a number of other works. Thus in determining his text he has not only worked up and embodied in his book the critical material to be found in the best editions of his authorities, but also in such cases as Varro, Gellius, Servius, Orosius, in which the principal Fragments are imbedded, he has been able to collate the MSS., and for Nonius to make use of that at Wolfenbüttel, and even the two at Leyden.

The short preface, in which these points are treated amongst others, is followed by four chapters of Prolegomena: I. De Annalibus Maximis; II. De Litterarum Monumentis Privatis; III. Historiae Romanae Aetates primis lineis adumbratae; IV. Qua ratione hae relliquiae nobis traditae sint (pp. i–lxv), followed (pp. lxvii–ccclxvii) by a complete account of the lives and writings of the historians of the Republic, from Q. Fabius Pictor and L. Cincius Alimentus to the time of the Second Punic War, including all the annalists, Cato, Piso, &c., down to the last representatives of this kind of literature, Q. Aelius Tubero, Procilius, and Scribonius Libo, and, lastly, by way of appendix, the historians of uncertain date, Sulpicius Blitho, Alfius, and C. Piso.

We may add that the careful investigation of the minutest details has not prevented Peter from keeping in view the general historical movement, as he has himself indicated in the third chapter of the Prolegomena. Not that in a topic so difficult and open to controversy there will not be any more dubious and disputed points; about many questions it will never be possible to come to a definite conclusion, but the opinion of the author is always founded on independent and judicious investigation. On some points, about which I am at issue with the author, I shall speak in greater detail in the preface to the next *Index Lectionum* of the Breslau University.

The second part of the work (pp. 1-321) contains, in the same order, the Fragments of the historians, and first among them the few remains of the *Annales Maximi*. Here also the editor has made a conscientious and methodical use of the rich material at his disposal both in arranging and in determining the text of the Fragments. In two distinct sets of notes all necessary material for estimating and explaining the author's text is given; that some points still remain to be cleared up cannot be denied, although the work doubtless marks an immense advance. The author also knows how "nescire fateri," as, for instance, in that desperate Fragment of the 3rd book of Claudius Quadrigarius given in Priscian, vi. p. 697, Putsch (Claud. Fr. 49, p. 222), or in the passage of Livy, xliv. 14, 8 (Claud. Fr. 67, p. 228). In other places he has gone back to the authority of the manuscripts which had been doubted by others, *e.g.* in the interesting Fragment (1, p. 178) of Sempronius Asellio, given in Gellius, v. 18: "Nam neque alacriores ad rem publicam defendendam neque segniores ad rem perperam faciundam annales libri commovere quicquam possunt," where, however, I had already (in my edition of 1853) silently given up a former conjecture of mine (see *Jahrbücher für Philologie*, ci., 1870, pp. 303 foll.). In other places again he has attempted emendations of his own, some of them in the modest obscurity of the notes, *e.g.* in Coelius Antipater, Fr. 46, given in Nonius, s. v. *exfundare*, where *amisso* is declared to be a gloss; or in Sisenna, Fr. 20, from the same, s. v. *manipuli*, where the text is restored by a clever combination of several older conjectures. The new reading *coactus* instead of the traditional *conmutus* in the reading of the author must remain doubtful. The passage now stands: "Coactus tamen ex tempore signa constituit et, sicut steterant manipulos obverti jussit," in which *ex tempore signa* instead of *et tempora singula*, and *steterant* for *steterat*, as found in the manuscripts, were corrected, the former by Lipsius, the latter by Guilielmius. In the first word I think we must look for a proper name, viz. that of the Samnitic consul, C. Mutilus, who is known to have been at the head of the rebels in the "Social War" here described by Sisenna. The work is concluded by the handy indices (pp. 323-377), already mentioned, to the dissertation on the literary history and to the Fragments: I. Temporum index; II. Tabula rerum Romanarum quae his relliquiis continentur ex temporum ordine digestarum; III. Index verborum et nominum propriorum rerumque memorabilium; IV. Index locorum quibus haec fragmenta servata sunt; V. Index locorum ex horum fragmentorum numero ejectorum — together with references to those pages of the introduction where the grounds of this exclusion are given.

A few "Addenda et Corrigenda" on the last page conclude a book already valuable to the scholar even in its present unfinished state.

Martin Hertz.

Cicero. Select Letters, with English Introductions, Notes, and Appendices, by Albert Watson, M.A., Fellow and Lecturer of Brasenose College, Oxford. Oxford: at the Clarendon Press, 1870.

It is curious how completely Cicero's Letters have been passed over hitherto by English scholars. With the exception of an edition of a small selection from them by Mr. Parry, which is a mere school-book, humble in design and inaccurate in execution, there is no English work on

the subject which either does appear or could have appeared in Mr. Watson's list of authorities. And yet this is not from any want of intrinsic interest in the subject. Whether from a literary or a historical point of view, Cicero's letters are unique in classical literature. Their style is as pure and less ponderous than that of his orations, and even the most serious of them are full of life and freshness, such as could only spring from perfect candour, not unmixed with egotism in the writer. The present series is mainly confined to the political letters, in which we miss to some extent the playful fancy which characterises his more familiar writings; but the unrestrained *naïveté* with which he unfolds all his thoughts to his intimate friends, especially to Atticus, prevents even his business-letters from becoming dull. Historically these letters are invaluable. Though he doubtless overrates his own importance, yet Cicero was throughout his public life in the midst of the administration of affairs, and at times he played a very leading part. Hence he was in a position to impart information of the greatest interest; and this is communicated with an absence of reserve which opens to us all the intrigues of a most complicated period. There are few works of contemporary history which place us so completely behind the scenes; and when we bear in mind how very scanty and untrustworthy the other materials are for a history of the last years of the Republic, we shall be inclined to agree with Mr. Watson that "Cicero's correspondence furnishes the most detailed and trustworthy commentary on a very interesting period of Roman history." We should hope that Mr. Watson's own labours may induce many to study this commentary for themselves, who have hitherto been repelled by the vastness and want of arrangement in the materials before them. He has brought together 148 of the most important political letters, arranged in due order, and illustrated by annotations which are remarkable for the care with which they leave no difficulties unexplained. We do not always quite agree with his notes, and we think that he too often refers to grammars when a single line might have explained a grammatical peculiarity on the spot, as notably in reference to "sunt qui putant," in Ep. 29: but we feel that his notes may enable any scholar to read the letters rapidly and pleasantly without fear of being ever seriously misled. The translations suggested are generally accurate and pure in style, though he is sometimes too easily satisfied without reproducing the form as well as the meaning of Cicero's expressions: as in repeatedly translating Cicero's favourite metaphor "refrigescunt res," without any allusion to the passing away of "the heat" of business. In the sixth letter he has missed an evident joke of Cicero's, that he cannot find a messenger who will carry a letter *of more than ordinary weight* ("paulo graviorem," which Mr. Watson renders "conveying news of any importance"), without lightening it by reading its contents. In his note on "non quo," p. 87, he might have added that the reason suggested by these words is always not only not the true reason, but a hypothesis itself untrue in fact. In p. 188, Mr. Watson has become involved in difficulties yet more unusual with him, and though his suggestion rests on so high anthority as that of Mr. Merivale, we cannot readily believe that Cicero would speak of interest at 96 per cent. without any token of surprise, when we remember that the wildest flights of the satirists only make their usurers exact 36 or 60. Taking the notes, however, as a whole, they are careful, clear, and adequate; and would alone render the volume a valuable addition to the series in which it appears.

But the highest part of Mr. Watson's work consists in the prefaces and appendices to the several divisions of the letters. In the former he gives us a continuous history of the period which they embrace; and though the brevity which was enforced upon him naturally renders this a little dry, yet the purity of his style, and the clearness of his views, prevent it from ever being dull. He hits the salient points in a manner which betokens thorough knowledge of his subject, and lays before us briefly a vivid picture of the political struggles of the day: showing that he is well read in all the principal authorities for the history of the period; but yet maintaining throughout all a consistent independent view.

Of the appendices, perhaps the most valuable is the last, "On the meaning of the words 'Colonia,' 'Municipium,' and 'Praefectura:'" and any one who has been perplexed by the apparently hopeless confusion with which these words are used in Latin writers will be grateful for the assistance here provided for their elucidation. Throughout the book Mr. Watson shows a knowledge of Roman jurisprudence, and a special acquaintance with the history of the last century B.C., which have made him singularly competent for the task which he has undertaken, and we trust that his book may do much to encourage the study of a portion of literature which has been too generally overlooked.

History of the City of Rome. [*Geschichte der Stadt Rom.* Von Alfred von Reumont.] Dritter Band, II. Abtheilung.

The conclusion of A. von Reumont's work appears at a not inappropriate time, for the subject of this volume is Rome and the modern Papacy from the restoration of the Temporal Power by the warlike Pontiff Julius II. to the present day. The author has the advantage or disadvantage of a close personal acquaintance with his subject, for he saw the rising in the Romagna in Gregory XVI.'s time, and witnessed the failure of Pius IX.'s attempt in 1848 to conciliate the Catholic with the Liberal idea. It is almost a pity that he could not have given a sort of epic unity to his book by relating the union of Rome with Italy, but the work was completed in the spring of this year. Naturally von Reumont has passed over later events more lightly, and given his chief attention to the time of the Renaissance and the Counter-Reformation. Probably the two most interesting chapters are that on the literature and art of the Medicean age, and that on the culture of the last three centuries. After an account of the earlier period of the Renaissance, he proceeds to show in what the age of Leo X. differed from it. The whole period was one of great misery for Italy, and the elegant literary life of the upper classes seems to us much like the life of the gay company in Boccaccio's tale, who while away the time of the plague, and drive away unpleasant thoughts, by music and light—too often loose—conversation and story-telling. The moral indifference of Machiavelli would be alone sufficient to characterise an age, but the minute descriptions in Guicciardini of the doings of popes and emperors help us to understand it. Under Leo X. and Clement VII. the classical enthusiasm yields somewhat to the claims of Italian. The Court of Urbino owes its fame to the *Cortegiano* of Castiglione, which in the form of dialogue discusses moral and literary questions, as they were discussed by the men who gathered round the dukes and the two princesses Elisabetta Gonzaga and Emilia Pia, who owe it to Castiglione that they are still remembered, as the Lady of Ferrara owes her immortality to Tasso. Prose had greater difficulty than verse in extricating itself from the trammels of classicalism, for Dante and Petrarch had already made the claims of Italian poetry secure. Machiavelli had not yet made his native tongue the natural language of political science and of history. The earlier Renaissance was confined to a learned few;

the use of Italian made culture possible for the people. Not that Latin lost its place, but it had to admit a companion to share it. Grammarians, too, began to compare Italian with Provençal, and commentaries on Dante had already appeared, with some attempt at corrections of the text. It is curious how few of the great writers are Romans, but we may extend the remark to heathen times and Christian literature. No one of the great Latin authors except Cæsar was of Roman origin, and the Latin fathers wrote at Carthage, while the Christian writers at Rome mostly wrote in Greek. Theology and philosophy were at a very low ebb in Italy in this age; Italy was utterly unprepared for the Reformation. The want of any earnest belief is remarkable. In poetry, Ariosto only half maintains the tone of romance; the constant recurrence of monsters and wonders seems always tempting him into satire, and indeed satire is natural to an Italian writer. Quintilian already observed, "in other respects the Greeks excel us, but satire is all our own." Only in the poetry of Vittoria Colonna and of Michael Angelo is there anything like religious and earnest feeling; the rest is only comedy and sonnets. Preaching had been destitute of any true feeling even in Dante's time, and relied for effect on impostures and fables (*Paradise*, canto xxix.).

But now came the Counter-Reformation, and this too strengthened the cause of the national language as against Latin. In Germany the appeal of the Reformers was from the first to the people; the German Bible and service-books and hymns were the main instruments of the great change. Hence we have the sermons of the Jesuit Paolo Segneri, which made a great impression, though even these compare ill with the sermons of the great masters of French eloquence. And though Baronius wrote the *Annals of the Church* in Latin yet it was necessary to meet Paolo Sarpi's *History of the Council of Trent* by Pallavicino's *History* also written in Italian. The classical period, in fact, may be defined by two of the great Church Councils; it began with Constance, its power ended at Trent. Even in this volume of 900 pages much condensation is required to bring the matter within reasonable limits, and we can only refer our readers to the work itself. Von Reumont's summaries of the reign of each pope are clear and good, and in this part he has the advantage of having Ranke's impartial summing up before him; the later popes he himself touches on only lightly, though as one who sympathises with them, and is true to the Rome of the Papacy in which he has lived so long. The architecture and topography of Rome, of course, receive due attention, and there is something, though not as much as we could wish, on the state of the land, especially in the Campagna. The excavations also and the various discoveries from time to time are chronicled, and all is made available by a good index. There are also two maps, of Rome and of the Campagna, which in such a history one has constant need to refer to. Our author rightly lays stress on the reigns of the great Popes, from Julius II. onwards, who restored Rome from its ruins. Their efforts were naturally directed to the Vatican district, and this is one main reason why the ancient seven hills are now deserted, while the modern city is built on the old Campus Martius and the ground on the other side of the river. Rome, too, had now lost her connection with the East, and was looking westwards and northwards, and houses were naturally built along the most frequented roads. The whole work gives a complete history of the city from its foundation to our own time, and if the author has avoided some of the difficult topographical questions as to ancient Rome, the want of space may plead his excuse for omitting discussions which are likely to be soon perhaps ended by the rapid progress of discovery.

C. W. Boase.

PROPOSED HISTORY OF THE COMUNIDADES.

Mr. Clements Markham, the accomplished author of the *Great Lord Fairfax*, is engaged upon a history of the Spanish *Comunidades*.

The revolt of the *Comunidades*, or commons of the cities of Castille, against the illegal and tyrannical conduct of Charles and his regency (1519-23) is the turning point in Spanish constitutional history. Its success would have ensured to Spain a free government and liberal institutions. Its failure led to three centuries of misgovernment at home, and turned the genius and aspirations of the people into the paths of foreign conquest, colonization, art, and literature. Their success in those paths, due to the centuries of freedom in which their fathers had been educated, and not to the patronage of any Austrian or Bourbon, proves how great would have been their triumphs as statesmen and administrators in a free State. The history of the gallant stand against tyranny made by the *Comunidades*, under the leadership of Don Juan de Padilla, would appropriately be introduced by a sketch of the previous constitutional history of Spain, which is older and more complete than that of England. Such an introduction would be mainly based on the invaluable treatises of Marina.*

The best known account of the *Comunidades* is contained in the history of Charles V. by Bishop Sandoval. Besides a narrative of the events, Sandoval gives many of the letters addressed by Toledo and other cities to each other; and we also owe to him the preservation of those noble epistles which were written by Padilla to his wife, and to his beloved city of Toledo, an hour before his death. Though Sandoval is the "Clarendon" of the Spanish contest, and the defender of all royal acts, he shows a far more generous spirit than Clarendon, and speaks with respect of the champions of liberty. Besides Sandoval, there are several other accounts of this memorable struggle, namely: Gonzalo de Ayora (*Historia de las Comunidades de España*, MS.); Alcocer (*Comunidades de España*, MS.); Pero Mexia (*Historia de las Comunidades*, MS.); Maldonado (*El movimiento de España*); Sepulveda (*Historia de Carlos V*); and the epistles of Martin de Angleria. A very complete picture may be drawn of the cities themselves, and of their state at the time of the revolt, from the local chronicles of Cobezudo (*Antiguedades de Simancas*); Colmeneres (*Historia de Segovia*); Rico (*Historia de Cuenca*); Sangrador (*Historia de Valladolid*); Lopez Osorio (*Grandeza y caida de Medina del Campo*, MS.); Pisa (*Descripcion de Toledo*).

The modern accounts of the revolt of the *Comunidades* are by Ferrer del Rio (*Decadencia de España*), and Lafuente (*Historia de España*, III. lib. i. tom. xi. caps. ii.-vii. pp. 96-259). English readers at present only have a narrative of this famous event in Dr. Geddes's *Tracts*, written in the time of Queen Anne, and now little known; and in Robertson's *Charles V.* The sole authority referred to by the former is a bad English translation of Sandoval, published in 1652, while Robertson quotes Martyr's *Epistles*, Sandoval, Miniana's continuation of Mariana, and Geddes. The history of this period, based on a complete examination of accessible authorities, has never yet been submitted to English readers.

Contents of the Journals.

Von Sybel's Historische Zeitschrift, 1871, pt. 1.—Horowitz: National History in the 16th Century. [Contrasts the national character of the historical spirit bred in Germany by the Renaissance with the classical and purely antiquarian type in Italy. An analogous revival took place in England under the Tudors.]—Henke: On the French Women of the Reformation Time. [Points out their rising influence and superior education.]—In a review of Freeman's and Froude's last volumes, Pauli points out the unfairness of the latter to Elizabeth and the Anglican Church, his carelessness as to foreign names and events, the neglect in the later volumes of the social state of England, and of the relations between Crown and Parliament.

The last number of the *Westminister Review* contains an article on "The Social Condition of England under Henry VIII.," in which the discrepancy between Mr. Froude's account and those of Polydore Vergil and other contemporary chroniclers is insisted on. The author exaggerates the amount of arable land absorbed into pastures for the wool

* *Teoria de las Cortes. Ensayo historico-critico sobre la antigua legislacion de los regnos de Leon y Castilla.* (Madrid, 1808.)

trade, and fails to confute Froude's statements as to prices (vol. i. pp. 21, foll. ed. 1856). Too much stress is laid on ballads and other vague sources of information.

In the last number (Nov. and Dec.) of the *Bollettino dell' Instituto di Corrispondenza archeologica*, Friedländer draws attention to a coin apparently struck at Dium, in Macedonia, by Brutus during the Civil War. It seems to speak of him as *Princeps*.

In the last number of the *Nuova Antologia*, F. Ferrara reviews a book on the banking system of Venice from the 13th to the 17th century, and avails himself of some new information to give a summary of the whole subject, rejecting utterly the legends which beset the "origines" of political economy, as they do of other sciences. The curious thing is that the State is always borrowing of the early banks without (apparently) paying any interest. No wonder that the banks of the families Soranzo, Garzoni, Pisani, Lippomani, were called the "four pillars of the State," but neither can we wonder at their bankruptcy. There may have been some secret arrangement with the government which we have not yet discovered which suddenly came to an end.—In the same number Bertolini gives a summary of the progress of critical enquiry into the early ages of Rome.

Philology.

On the Pronunciation of *c* before *e, i, y, ae, eu, oe,* in Latin.

In trying to introduce a more correct pronunciation of Latin, the great stumbling block has always been the hard pronunciation of *c* before *e, i, y, ae, eu, oe.* "Are we to pronounce *Kikero, et ketera, skiskere?*" has generally been considered, if not a convincing, at all events a most telling, argument against phonetic reformers. It must be admitted also that even scholars who are fully convinced that *c* before *e* and *i* was during the Augustan period pronounced like *k* have seldom ventured to adopt this pronunciation, whether from fear of ridicule or from a dislike of the harsh and disagreeable sound of such words as *Kikero, fakit,* &c. I have never heard *c* pronounced as *k* before *e* and *i* in any school or university of Germany and France,* though I believe there is hardly a scholar who has not declared his decided opinion that this is the right pronunciation.

If, therefore, we decide to pronounce *c* before *e* and *i* as *k*, most of us, I suspect, would do so reluctantly, and if there were any escape, many would gladly avail themselves of it. It is for this reason that I have put together what might be pleaded at least in mitigation of punishment for those who, in pronouncing Latin, wish to keep up a distinction between *ca, co, cu,* and *ce, ci, cy, cae, ceu, coe,* or to give to the latter a more palatal or even an assibilated sound.

Let us consider, first, that, whatever we do, the *k* of *ka, ko, ku,* is, from a physiological point of view, different from the *k* in *ki* and *ke*. The former is produced by contact between the root of the tongue and the soft palate, the latter by contact between the back of the tongue and the hard palate. The *k* pronounced in the former way may be called *guttural,* in the latter, *palatal.* It is this palatal position which is liable to many modifications. At first we hear a furtive *y*, as in *kyind;* then we hear the German *ch*, the palatal spiritus, as in *ich*—a sound difficult to pronounce, and therefore by foreigners frequently changed into *sh.* This *sh* preceded by a very slight dental or alveolar contact gives the Italian *ci* (tshi). Further dialectic change may substitute even *ssi* and *thi* for an original *ci.*

This being a recognised process in the pronunciation of *c* before *e* and *i* in many languages, let us now suppose that in Rome, too, *c* before *e* and *i* was pronounced differently from *c* before *a, o,* and *u,* without attempting, however, an exact definition of what that modification was, whether *ky*, or *tsh*, or *ss.* Would the arguments produced by Scheller, Schneider, Corssen, and others, in support of *ce* and *ci* being pronounced *ke* and *ki*, be really unanswerable? I believe not.

Their strongest argument is: "If the Greeks write *Cicero*, they write Κικέρων, and if the Romans write Κέκροψ, they write *Cecrops*" (Corssen, vol. i. pp. 44 *seq.*).

My answer to the first point would be this: Unless we admit that *c* in *Cicero* was pronounced either exactly like ζ or exactly like σ—and this nobody maintains—nothing remained to the Greeks but to use *k* as the nearest approach to the modified *c.*

My answer to the second point would be this: The Romans, after the period of the Decemvirs, never used *k* except in certain words, and even before that time, they never used it before *e;* if therefore they had to transcribe Greek words, they had no choice but to use *c*, which in many cases represented the sound of *k*, and might be trusted to represent that sound even before *e* and *i*, at least in foreign words.

I maintain, therefore, that the supposition of a modified pronunciation of *c* before *e* and *i* in Latin is not incompatible with the evidence derived from Latin words transcribed by the Greeks, or Greek words transcribed by the Romans. Supposing even, what we need not, that *ci* was pronounced in Latin as in Italian or in English, the mere fact that it was not pronounced like ζι or σι would be sufficient for our purpose, because it would have driven the Greeks to have recourse to the approximate transliteration of κι. They could in no case have used ζι, because the ζ was looked upon as a double consonant, and, in the middle of a word, would have made a preceding short vowel long.

Next comes the question, Why, if *ci* had a different sound from *ca* in Latin, was there not a separate letter introduced into the Roman alphabet? This is what, for instance, the Umbrians did. With them the *c* before *e* and *i* had a peculiar, probably an assibilated,* sound, and they therefore introduced into their alphabet a new letter, ɗ, which never occurs before *a*, to represent that sound,† while, when they adopted the Roman alphabet, they used the *s* with a diacritic mark, *ś*. Why should not the Romans have done the same?

My answer is that, first of all, even the Umbrians occasionally (Corssen, i. p. 44) retained the *k* before the softening vowels, though they would no doubt have pronounced it quite correctly, whichever way it was written.

Secondly, the Romans, we know, had no taste for diacritical marks. They were attempted now and then, but always became obsolete after a short time. One of the strangest facts in the history of the Latin alphabet (Corssen, i. p. 10) is that during a long period (to 290 B.C.), after the

* I hear that this pronunciation has been successfully adopted at Marlborough School.

* I say "probably assibilated" because in the Latin transcription *s* with the gravis was chosen as the nearest letter. Otherwise the fact that the same letter, ɗ, is used in Umbrian before *l* would rather point to *ky* as its probable sound, the *l* after a *k* and *p* being apt to produce a *y* after the *k;* cf. Italian *chiaro* for *claro, piano* for *plano*. See *Umbrische Sprachdenkmäler*, ed. Aufrecht and Kirchhoff, p. 73.

† From *kurnak*, cornix, abl. *kurnaçe*, cornice.

letter *k* had been almost entirely discarded, the guttural tenuis and media were represented by one and the same letter, the *c* (γαμμα). It would be impossible to admit that during that time the Romans had really not distinguished in pronunciation between such words as *acer* and *ager*. All we have a right to conclude is that, having for some unaccountable reason given up the letter *k*,* they were satisfied in representing the guttural tenuis and media by the letter γαμμα, till the inconvenience began to make itself felt, and led them to distinguish the guttural media by a diacritical mark, *G* and *C*. This very fact, that the Romans for a long time wrote *c* only, leaving it to the reader to pronounce *c* or *g*, renders it more intelligible that they should not, like the Umbrians, have invented a diacritical letter to represent the modified sound of *c* before *i* and *e*, satisfied that no one who knew Latin would ever pronounce that letter hard before these vowels.

I do not argue, as others have done, that, because in Umbrian the guttural tenuis before *e* and *i* was modified, therefore it must have been modified in Latin also. I only suggest that, as the Umbrians occasionally retained the unmodified letter, even where it had to be pronounced as modified, the fact that the Romans never invented a modified letter does not prove conclusively that they pronounced the *c* in *ci* exactly like the *c* in *ca*. Practical and fond of ancient customs as the Romans were, they retained *C.* as the abbreviation of *Gaius* and *Gnaeus*, though no one would maintain that they ever pronounced *Caius* or *Cnaeus*.

Another argument in support of the hard pronunciation of *c* before the *i* and *e* is taken from Gothic. It is said that, in words adopted from Latin in the 4th century, *ci* and *ce* are represented in Gothic by *ki* and *ke* (Corssen, i. p. 45). It is so, no doubt. We find *aikeit-s* for *acetum*, *karkara* for *carcer*, &c. But, first of all, these words may have reached Ulfilas in their customary Greek transliteration, in which case he would naturally have rendered the Greek καρκερ by *karkara*. Secondly, even if he heard these words pronounced, and heard them pronounced with a modified *c*, he had no such letter in his alphabet. He could not have represented the palatal tenuis by either his soft *z* or *s*. He found himself, in fact, in exactly the same dilemma as the Greeks, and had to be satisfied with some approximate sound. Besides, this argument would prove too much. Ulfilas represents γραϊκός, *graecus*, by *kreks*, yet no one would suppose that either Greeks or Romans pronounced *g* like *k*. In other cases Ulfilas clearly represents letter by letter, not sound by sound; and in imitation of Greek, he actually writes *aivaggeli*, εὐαγγέλιον, using γγ for *ng*, and adopting that spelling even in purely German words.

I now come to another point, which those who consider it inevitable that we should say *Kikero* have not sufficiently considered, and which would show that *ci*, if followed by another vowel, was not only modified, but really assibilated, in Latin.

I begin again with the Umbrian, which assibilates both *t* and *c* before *i* (Corssen, i. p. 62). Thus *ki* becomes *çi* (çj) and *si* (sj), and sometimes *s*; *ti* becomes *si* (sj), and is also written *çi* (çj), sometimes *ç*. These changes had taken place in Umbrian, partly also in Oscan, before the first Punic war. Now it is quite true that this does not prove that the same change took place in Latin, but unless it did, one fact, admitted by the best authorities, would remain unexplained in Latin. Corssen has very well proved that *tius* and *cius* are not interchangeable in Latin at random, that some words, like *nuntius*, are always spelt with *t*, others, like *condicio*, always with *c*. But he has also proved (p. 54) that from about 200 A.D. words with *ti* began to be spelt with *ci*. How was that possible? If *ci* was always pronounced *ki*, then assibilated *ti* could never have been written *ci*. The only point where these two letters can possibly meet is the assibilation. *Ti* may go as far as *tsi*, but unless *ki* also went as far as *tshi*, the two could not have met, and no Roman, whether in Italy or in Africa, could have attempted to write *renuntiatio* by *renunciatio*. The argument taken from Gothic, where *lectio* is spelt *laiktio* in the 4th century, proves nothing, because Ulfilas may here have transliterated letter by letter. In another Gothic document (Mon. Neapol.) we find the Latin *cautio* rendered by *kautsjo*, which clearly shows that the assibilated pronunciation of *tio* existed at that time. Besides we know for certain that in the 5th century (Corssen, i. p. 64) it was considered wrong not to assibilate *ti* if a vowel followed ("fit hoc vitium; quotiescumque enim post *ti* vel *di* syllabam sequitur vocalis, illud *ti* vel *di* in sibilum vertendum est"). It is not likely therefore that Ulfilas, who died 381, ever heard either *cautio* or *lectio* pronounced without an assibilated *t*.

Lastly, the argument that Latin words adopted in German dialects have preserved the hard *k* or *ch* proves very little. These words may have reached the Germans through a Gothic channel, and the Gothic language knew of no guttural sound or letter besides *k*, *q*, *h*, *g*, and *x*. *Carcer* in Gothic could only be written and pronounced *karkara*, and this in Old High-German would regularly become *charchâri*, *Kerker*, as κυριακόν became *chirichâ*. As soon as the German language had developed a hard *z*, we find *census* changed to *zins*, *cancelli* to *chanzella*, *macellarius* to *metzeler*, *cella* to *zella*, *circus* to *zirc*. This does not prove that Latin *c* before *e* and *i* was then pronounced exactly like the German *z* or *tz*, but only that German *z* and *tz* came nearer to the Latin sound of *c* before *e* and *i* than German *k* or *ch*.

Looking without any preconceived opinion at the evidence collected by Corssen and others, I arrive at the conclusion that before the 3rd century A.D. *c* before *e* and *i* *may* have had the same, or nearly the same, sound as *c* before *a*, *o*, *u*; but I maintain that there is no evidence to prove that the *c* before *e* and *i* was not slightly *mouillé*, or even assibilated, if only we do not commit ourselves to the statement that it had the same sound as either ζ or σ. If we insist on the same pronunciation in *ci* and *ca*, we may be, nay, most likely, we are, entirely wrong. If we distinguish between *ci* and *ca*, modifying the *ci* according to the Shibboleth of our own pronunciation, we must know that our peculiar pronunciation in England, or Germany, or Italy, may not be entirely correct, but our conscience need not be aggrieved as long as we keep up some kind of distinction between *ca* and *ci*. That *g* before *i* was differently pronounced from *g* before *a* should also be borne in mind (Corssen, i. 92), as an analogous case in support of the palatal or assibilated pronunciation of *c* before *e*, *i*, *y*, *ae*, *eu*, and *oe*.

MAX MÜLLER.

* This happened about the time of the Decemvirs (Corssen, i. 8). *K* occurs very seldom, if ever, before *e* and *i* in Latin. *Keri*, quoted by Corssen, i. 44, is a Volcentian inscription. *Dekem*[*bres*] is taken from a Grecising inscription.

Phœnician Studies. [Phönizische Studien. Von Prof. Dr. M. A. Levy. Heft 4.] Breslau: Schletter.

PROFESSOR LEVY, mindful of his promised repertory for discoveries in Phœnician epigraphy, has just published the fourth fasciculus of his interesting *Studies*. He admits himself, in his preface, that the harvest gathered since 1863 is not considerable; in fact, except the eighth inscription of the 14 *graffiti* discovered at Abydos, in Egypt, and published by M. H. Zotenberg in the *Journal asiatique*, 1868 (avril-mai), the first inscription of Nora, the second of Sulcis, and the first of Tharros, all three discovered in Sardinia and

published by M. de Maltzan, none of the Phœnician inscriptions found since 1863 contains anything but proper names, the explanation of which we consider at least hazardous, if not even useless at present. But the unproductiveness of Phœnician epigraphy is not M. Levy's fault; he can only tell us what has been ascertained; and, in spite of the scantiness of the discoveries, this fourth part of his *Studies* is not less useful than its predecessors.

Before commencing the interpretation of the inscriptions discovered since 1863, Prof. Levy returns to those designated by M. de Vogüé, Cit. 37, 38, 39, 40, and 41, and to the third of Malta, which has been published several times, accompanying them with various new observations. In the bilingual inscription, Cit. 39, M. Levy reads (p. 4), slightly modifying the reading of M. de Vogüé, פעל ק[סו]ם, which represents the Greek words ἀνὴρ ἐκπωματοποιός. קסום is compared to the Biblical word קשות, Exod. xxxvi. 16, the meaning of which is still uncertain; besides, as M. Levy observes, the Hebrew has a plural of the feminine form. It would perhaps be more natural to read ק[רר]ם, a word which signifies "pot" in Aramaic. The remarks on p. 8, on the goddess ענת, which represents Ἀθήνη in the bilingual Cit. 41, and on the form יקדש (p. 7), which evidently represents the imperfect, are of great interest. The form of the proper name יתן (p. 4), which Prof. Schlottmann derives from a Phœnician root יתן, corresponding to the Hebrew root נתן, and which M. Derenbourg explains by the Hebrew word איתן, is left undecided by M. Levy (p. 8). Our own view is that the form יתן comes from נתן, and it has its analogy in the names יצחק, יצהר. The *graffiti* (pp. 15-35) are very carelessly written; and it required the sagacity of a palæographer like M. Levy to read them correctly. We cannot reproduce here all the corrections made by M. Levy in the readings of M. Zotenberg. The analogy of the name רמבעל with the Hebrew יהורם (p. 17) is very plausible. The inscription No. VIII. is corrected in several places by M. Levy, and we cannot hesitate to prefer his readings to those of M. Z.; but it is difficult to admit with M. Levy (p. 22) that פטרת stands for the Biblical name פתרס, and still less that there are two consecutive names of towns introduced with the preposition ב, and without being connected by ו. Possibly we should read אנך . . . בא למצרים בפטר תבדמנקרת הנ[ה], "I . . . came into Egypt, when . . . repaired thither;" comp. ויפטר, 1 Sam. xix. 10. M. Levy is perfectly right in rejecting M. Zotenberg's explanation of בפטרת, "at the time of the death." For the first inscription of Nora and the second of Sulcis, M. Levy reproduces the new interpretation of M. de Maltzan, which is by no means satisfactory. He adds, however, some palæographical corrections, and abstains with reason from giving any new interpretation. As for the first inscription of Tharros, M. Levy gives the true reading, and the only possible explanation, except with regard to the word אז, which is not yet confirmed as a demonstrative pronoun. On pp. 66-78 are some interesting remarks on the inscriptions found in North Africa; and pp. 78-85, some *Addenda* to the Phœnician dictionary published by M. Levy in 1864.

Ad. Neubauer.

Pliny's Letters. [*C. Plinii Caecili Secundi Epistularum Libri novem. Ex Recensione Henrici Keilii.* Leipzig: Teubner, 1870.

This is an enlargement and completion of the edition of Pliny's letters published by Keil in 1856. Its importance and interest consist first in the elaborate preface, in which a complete account is given of the authorities on which the constitution of the text must rest, secondly in the useful index of names added by Mommsen.

The most perfect known MS., which contained the nine books of the epistles and the letters to Trajan, is now lost; and all that we know of it is from the readings preserved in the Aldine edition (1508), whose author was the first to make use of it. Of the now existing MSS. Keil makes three families. The first is represented by the Medicean (M) or Laurentian (10th century), the only existing copy which contains the nine books of the epistles, and this only to 9. 26. 8. In this class is also included the Vaticanus (V), a copy perhaps a little older than M, containing only the first four books, and the Pragensis (14th century), evidently copied from M (though some lacunae are filled up from MSS. of another class), and therefore of no independent value. A MS. now lost, resembling M, furnished, in the later books, material for the edition of Schurener (1474).

The second class is represented by the Florentinus (F), 10th century: a copy including from the first book to the sixth epistle of the fifth. The Codex Riccardianus, which was collated by Gori in 1728, but stolen apparently in 1832, exhibits readings mostly coinciding with those of F.

In a third and large class of MSS., evidently copied from a corrupt archetype, the eighth book is omitted, and the ninth put in its place. At the beginning this archetype was often corrected from MSS. of the second class. The correctest representative of this class is the Codex Dresdensis (D), from which Keil shows by a minute argumentation (p. xv) that the archetype of this class must have been cognate to M and V.

Our only authority for book viii. is therefore M and the Aldine: for the end of book ix. the Aldine, and the bad MSS. of class 3: for the epistles to Trajan the Aldine only. For the rest of the letters it follows from what has been said that, as a general rule, the first authority is due to M and V, though even they are full of interpolations: the second to F and D, especially when the latter agrees with M and V: the case becomes doubtful where M stands alone against the rest. The Panegyricus has no MS. authority older than the fifteenth century.

It should be observed that Keil makes no mention in his preface, and very little in his notes, of the corrections of Joseph Scaliger on the Panegyricus made on the margin of the edition of Stephanus now in the Bodleian, and quoted by Hearne in his edition of 1703. A great number of these emendations (so far as I have examined them) are but repetitions of those of Cuspinianus: some are due to MSS. Some, however, might have been mentioned in an edition like this for their interest, if not for their truth: *e.g.* "haveant" (?) for "abeant," c. 2; "mergi spargenti amne" for "mergi et reparari amne," c. 30.

The index of names by Mommsen is useful so far as it goes, but it does not pretend to the fulness of a complete Onomasticon. In the arrangement of the letters Keil has followed the lines traced in Mommsen's interesting article on the life of the younger Pliny in *Hermes*, vol. iii. pp. 31, foll.

H. Nettleship.

Intelligence.

Dr. Giuseppe Pitrè writes from Palermo that a series of meetings have lately been held for the promotion of the study of the Sicilian dialect, under the presidency of Cav. Lionardo Vigo, the accomplished author of *Dante e la Sicilia* (Palermo: L. Pedore, 1870). They were attended by representatives from all the Sicilian provinces, and were remarkable in several ways. The most interesting discussions related to the use of *c* in such words as *ciuri, ciume*, representing the Italian words *fiore, fiume*, which some non-Palermitan members proposed to change into *sc*, though they ultimately gave in to the feeling of the majority. The transactions of these meetings will be published; but as Dr. Pitrè was secretary to them, he mentions by anticipation that the following important points were settled:—1. Orthography to be

the same over the whole island. 2. This orthography to be based upon the Palermitan idiom, without however reproducing its phonetic corruptions. 3. Popular songs, stories, and fables, on the other hand, not to be reduced to this uniformity of spelling, but rather reproduce, with a "photographic" accuracy, the varieties of their vernacular dialects. The orthographic rules proposed by Vigo (not a Palermitan) were discussed and approved by a committee appointed for the purpose, consisting of members from all the provinces, and afterwards sanctioned by the whole congress. The congress was then constituted as a Literary Academy, competent to be re-opened at the invitation of the secretary on the request of ten members. The subjects for the next meeting are:—1. "Terms and expressions in the living language of Sicily which have become antiquated in Italian." 2. "Terms of arts and trades."

Mr. R. C. Jebb, Public Orator of Cambridge, will publish in the course of this year a collection of his translated compositions in Greek and Latin.

Contents of the Journals.

Studien zur Griechischen und Lateinischen Grammatik, herausg. von G. Curtius, vol. iii. p. 2.—Fr. Allen: De dialecto Locrensium. [By the help of two inscriptions, a treaty between two cities of the Locri Ozolae, published in 1850, and a still more recently discovered document, relating to a colony sent to Naupactum from the Locri Hypocnemidii (probably = Opuntii), the Locrian dialect has become one of the best known varieties of Doric. Mr. Allen's paper contains an excellent discussion of its forms, occupying pp. 205–280. These show on the one hand a leaning to "stricter" Doric—due, however, as is suggested, to the greater antiquity of the inscriptions—especially in preserving the *F*, and contracting *οε* and *οο* to *ω*; on the other hand, a close affinity to Phocian and Ætolian, and through them a resemblance to Æolic: *e. g.* *-οις* in the dat. pl. of the 3rd decl., *ἐν* for *εἰς*, a pres. part. in *-είμενος*, and *ὕδωρ* (Bœot. *οὔδωρ*) for *ὕδωρ*.]—A. Clemm: Beiträge zur griechischen und lateinischen Etymologie. 1. *Σαῦλος σαῦρος σαυρωτήρ.* [From a root *sva*, with various determinants, come *σεύω*, *σαίνω* (Germ. Schwanz), *σόβη* (Schweif), *σάλος* (O. H. G. swellan); *σαυρωεήρ* means tail-piece.] 2. *γρῦ.* [Root gar, to crumble; grânum, *γῦρις*, fine meal; Sanscr. *g*aras, age, *γέρων*; distinct from *γρῦ*, a grunt.] 3. *λίγδην.* [*λακ* or *Fλακ*, to break.] 4. *αἴσυλος ἀήσυλος.* [Takes the latter to be probably *α-ἴσυλος*, iniquus, by itacism. Or the root is *ἀFε*, to harm, in *ἄδω*, &c.] 5. *δεῦρο, δεῦτε.* [Explains them in a very interesting way as pronominal words: *δε* is the prevailing "deictic" element in *ὅδε, οἰκόνδε, δεῖνα, -δις*; Sanscr. idam, Lat. idem; *υ* appears in *οὗτος, ἐνθαῦτα*, or *ἐνταῦθα*; *-ρο* is parallel to *πρό*; *-τε* either as in *αὖτε*, or, as Curtius suggests in a note, contains *ἵτε*.] 6. *μάχλος.* [*μακ* in *μαῖμαξ*, stormy, &c. For the asp. cf. *ἀκραιφνής* for *ακραπινής, νεοχμός*.] 7. *κίβδηλος.* [*κίβδη*, slag or dross.] 8. sons. [Part. of *sum*, hence the real guilty person; *sonticus morbus*, a real grave disease; *sontica causa*, a good reason.]—Moritz Schmidt: Das Tzakonische. [An elaborate résumé from the existing sources—Leake, Thiersch, Deville, and others—in anticipation of a work by a native Tzakonian, Demetrios Chaliotes.]—G. Curtius: Zur Geschichte der griechischen zusammengezogenen Verbalformen. [A masterly analysis of the forms of verbs in *σω, εω, οω*, with the Homeric *φορήμεναι, ὀνήμενος, ὁμαρτήτην*, the Æolic verbs in *αιμι, ημι*, and *ωμι*, and the Latin forms. Hirzel's view, that the peculiar Æolic conjugation arose from analogy, and Allen's, that *φιλήμενος* is from *φιλη-έμενος*, by assimilation for *φιλη-όμενος*, are rejected: everything is explained if we suppose that ajâmi became ajêmi, thus giving a conjugation with *ε* as characteristic throughout, but that afterwards the *ω*-conjugation partly or wholly took its place, giving *φιλήω* (later *φιλέω*), &c., just as *ὄμνομι* is succeeded by *ὀμνύω*. The paper teems with scientific interest.]

Rheinisches Museum, vol. xxvi. pt. 1.—A. W. Zumpt: On the Lustra of the Romans. [Exemplification of the theory advocated in the previous volume of the R. M.]—W. Vischer: A Locrian Inscription from Naupactus, now in the Woodhouse Collection. [In the British Museum. It seems to show that the Opuntian Locrians sent a colony to Naupactus just *after* the close of the Peloponnesian war, when all that district was deserted, though Oekonomides, the Athenian editor, would date the settlement fifty years earlier. The inscription is given at length, together with a facsimile and an interesting philological commentary.]—K. Dziatzko: The *deverbia* of the Latin Comedy. [Discusses the orthography of the word, and seeks to establish that it was, like the Greek *καταλογή*, a technical name for the recitation in a comedy.]—R. Rauchenstein: On the Antigone of Sophocles. [Emends the text in sundry places.]—J. Savelsberg: Latin Particles ending in *d* and *m*. Part 1.—W. Schmitz: On the Tironian Notes. X. [Gives a description of the MS. which perished along with the rest of the treasures of the Strasburg Library; it is satisfactory to find that an accurate collation of it was made in 1869.]—N. Wecklein: On Æschylus, Agam. 717, seqq.—J. M. Stahl: On Thucydides, iii. 37.—M. Voigt: On Plautus, Pseud. iv. 6, 14.—E. Bährens: On Phaedrus. [ii. epil. 12; iv. 1, 8; iv. 18, 18.]—L. Müller: On the Bern Scholia to Lucan. [Considers the scholium on Lucan, ii. 2, and the emendation proposed by Haupt in the last volume of the Hermes.]—H. Usener: Prof. Haupt and the Scholia to Lucan. [A crushing reply to Haupt's strictures on Usener's view as to the words "natura naturam vincit et dii deos," quoted by the Scholiast from a writer whom he describes simply as "antiquissimus poeta:" Haupt, assuming him to be a Latin poet, makes a senarius out of the words.]—M. Voigt: On Cicero ad Att. xv. 26.—H. Anton: On Cæsar, B. C. iii. 59.

Philologischer Anzeiger, herausg. von E. von Leutsch, vol. ii. part 9. (Selected reviews.) Analecta Philologica Historica. 1. De rerum Alexandri Magni scriptorum imprimis Arriani et Plutarchi fontibus diss. Alf. Schoene. [Shows that Arrian did not derive his narrative so directly as has been supposed from the writings of Alexander's officers: makes it probable that the immediate source of Arrian and Plutarch was a compilation made about the 2nd century B.C. There are two reviews, the first by E. S.]—Zur Frage über die Reihenfolge der olynthischen Reden, von J. von Klebelsberg. Rev. by B. [Defends the traditional order.]—Studien zur Redekunst, von C. Schmelzer. Rev. by B. [For the rhetorical and æsthetical studies in the higher schools.]—Gul. Studemund commentatio de Vidularia Plautina. [With an important fragment of four pages, preserved in the Ambros.]—Titi Livi ab urbe condita libri, erklärt von W. Weissenborn; Bd. iv. fourth edition. Rev. by E. von Leutsch. [Wishes that Weissenborn had paid more attention to the criticism of Livy's speeches; showing by the instance of Hanno's speech, xxi. 10, that they have sometimes a merely artistic or poetical value.]—Dr. E. Hedicke: de codicum Curtii fide atque auctoritate. Rev. by A. H. [Valuable.]—Dr. E. Grunauer: Beiträge zur Texteskritik des Q. Curtius Rufus. Rev. by A. H.—Part 10. Corssen: Aussprache, Vokalismus und Betonung der lateinischen Sprache. [The reviewer confines himself mostly to prosody: he makes a good many complaints of hasty work. See *Academy*, vol. ii. p. 81.]—Pindar's Siegesgesänge, mit Prolegomenis über Kolometric und Textkritik, von Moritz Schmidt. 1. Band. Olympische Siegesgesänge. Rev. by E. Krüger. [Regards M. Schmidt's system as radically false. The reviewer's own remarks, especially on the difference of prose, poetry, or rhythmical speech and song, are most instructive.]—Marco Antonio Canini, Fragment du Parthénée d'Alcman. Rev. by F. Blass. [The same of which Blass gave a collation and restoration in the Rhein. Mus.]—Theocriti Idyllia, iterum edidit et commentariis criticis et exegeticis instruxit A. Th. Fritzsche. Rev. by E. v. Leutsch. [A valuable edition: complaint of the form of the notes, and of the mass of references.]—De Aristidis Quintiliani doctrinae harmonicae fontibus. Scr. Herm. Deiters. Rev. by C. von Jan. [Little due to Aristoxenus, and that not directly; more to the school of Damon, and generally to Platonic influence.]—Ad. Michaelis: Ueber die Composition der Giebelgruppen am Parthenon. C. Strube. Studien über den Bilderkreis von Eleusis. [Good archæological essays.*]—Otto Benndorf: Griechische und sicilische Vasenbilder. 2. Heft. H. Heydemann: Griechische Vasenbilder. [Archæological works of great importance.]

Zeitschrift für ägyptische Sprache, Dec.—The Building and Measurements of the Temple of Edfu. Part 1. By H. Brugsch.—On a Pillar in the Turin Museum, by F. Chabas. [Contains a minute description of the felicity which the ancient Egyptians prayed for in this life and the next.]—The Double Calendar of Mr. Smith, by A. Eisenlohr.—On the same, by R. Lepsius.—Hieroglyphic Glossary for 1870.

Literarisches Centralblatt, Jan. 7.—Land's Anecdota Syriaca, rev. by Th. N. Jan. 14.—Haug's Essay on Pahlavi, by J. [Criticism of philological details.] Jan. 21.—Strauss's translation of Laò-Tse, by P. [Depreciates the value of Laò-Tse as a religious philosopher.]

Theologische Quartalschrift, 1870, No. 4.—The Inscription of King Mesha, by Prof. Himpel. [A translation, with notes which contain but little of interest, and a minute criticism of Dr. Kaempf's treatise. The refutation of Dr. K.'s conjecture בן ישי in line 5 is complete.]—Roorda's Commentary on Micah, by the same. [A model of fairness in criticism.]

THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance.
The Editor of THE ACADEMY *cannot undertake to return communications which are not asked for.*
The next number will be published on Wednesday, March 15, *and advertisements should be sent in by March* 11.

NOTICE.

THE ACADEMY *will in future appear regularly on the* 1*st and* 15*th of every month.*

General Literature.

Catalogue of Prints and Drawings in the British Museum. Division I.: Political and Personal Satires. Vol. I. Printed by order of the Trustees, 1870.

IT is not quite clear what proportions the entire scheme, represented by this handsome volume as its first instalment, is intended to assume. Is it proposed to catalogue, in a similarly full illustrative manner, all or several of the various classes of subjects into which the Museum prints and drawings might be arranged, or is it only in contemplation thus to describe such prints and drawings as can be termed political and personal satires? The title-page would rather lead us to the former inference. If such *is* the intention, the work taken in hand is indeed a vast one; and, even supposing the second alternative of the two, the enterprise involves a huge amount of steady, systematic, and intelligent labour. The volume now before us contains 752 large and often closely printed pages, and 1235 several items; yet it only takes us up to April 1689 in chronological sequence. The items of a date earlier than 1600 are but few, 55 altogether; practically therefore it may be said that the whole volume is engrossed by about 89 years of the 17th century. Considering that 182 years have elapsed since then, we should have, at the same proportional rate, about 2440 satirical prints and drawings remaining to be catalogued: but the reader need not be reminded that in fact the rate would not be in the same proportion, but enormously increased. And, after all the satirical works shall have been disposed of, it would seem that *some*, at any rate, of the other classes of works are to be taken in hand; else why the phrase "Division I." in the title-page?

The British Museum may be congratulated upon having undertaken this solid and interesting work, and also, and still more especially, upon having got hold of a good, honest, capable worker to execute it—one who has a turn for such employment. As the introduction informs us, "the Catalogue has been prepared, under the direction and supervision of the Keeper of the Prints and Drawings, by Mr. Frederic George Stephens:" I apprehend, therefore, that the Keeper, Mr. Reid, is entitled to the chief or sole credit as originator of the scheme, and Mr. Stephens as its executant. They may both look with complacency upon a large amount of sound and useful work ably done.

The volume, though properly entitled a catalogue, is in truth something much more than that. By the very nature of its contents, it becomes a sort of tableau of the highways and byways of history, with the crooked turnings of personality; a chart in which the subjects uppermost in the mind of the public (mainly the British public) for some centuries past may be read well-nigh as readily as the eye takes in the meaning conveyed by a geological or statistical map. Besides this value, inherent in its subject-matter, the book furnishes an immense quantity of curious information, frequently in a very entertaining form; out-of-the-way details of news, rumour, or gossip, scraps or long smatches—sometimes unabridged pieces—in verse, and generally whatever can best serve to illustrate without overloading the immediate object of the catalogue-compiler's attention, the satirical print or drawing under his view. Each of these art-items is described with neatness and precision; the reader is enabled to understand accurately what it represents, with next to no critical expansion or dictation, in any part of the volume, as to the artistic merits or demerits of the works. The majority of the prints and drawings thus treated are in the department of the Museum appropriated to works of this class: Mr. Stephens, however, has not limited himself to these, but has included a large number of similar productions proper to the Departments of Printed Books and of MSS. in the same institution. Nor is this all; for a great deal of the illustrative information which his catalogue furnishes, as apposite to the prints and drawings enumerated, comes from other tracts and broadsides in the Museum, which were found to impart relevant facts, though no additional designs. It is notified that Mr. Stephens has thus examined more than 35,000 pamphlets, &c.; this being the first regular exploration of these obscure heaps that has ever been effected—obscure, but often yielding light to the adventurous enquirer. The book is in fact a mine of subsidiary or collateral details, in a high degree important to all students of the period of history here covered, conveniently arranged for reference, and set forth with the double advantage of the *ipsissima verba* of the original statement (in numberless instances), and of modern sifting and collation.

The earliest date included in this volume is 1320, which year yields a satire against that unfailing target, the clergy—"The Fox, as a Bishop, preaching to the Goose, Redbreast, Drake, and Stork." There is one more subject of the same date; and we next go on to two items proper to 1430, and then to 1537—well on in the reign of Henry VIII. It is no derogation from the historical value, and scarcely from the general interest, of the book, to say so; but it is, I think, a fact that an inspection of these satirical or personal outpourings of the Tudor and Stuart period, from first to last, is little adapted to increase one's respect for the spirit in which our English forefathers fought out their conflicts. Their motto might have been, "Nothing extenuate, and set down all in malice." There is throughout one seldom varying tone of low detraction—dogged, determined, plebeian insult—conscious, transparent misrepresentation. There is hardly a trace of a chivalrous, or even an honest, wish to do justice to an adversary; nor magnanimous superiority to the spite or the lie of the moment; nor sacred pity over an enemy fallen from the height of fortune, or buried in a bloody grave. The tone is gross—not so much because of the positive indecencies scattered here and there, as because it corresponds to the coarse impulses of minds mostly sullen or malignant in their serious moods, or unbending with roystering loudness. No doubt some people have an excuse for being malignant. A friend of a well-intentioned Puritan whose ears had been cropped off at the bidding of Laud had much palliation for malignity against that archbishop; but this would be no reason for denying him to be malignant. From a mere literary point of view also the satires can rarely indeed be called brilliant, or at all approaching to brilliancy. Several are pithy, clever, and expressive; others are forcible in a certain way—there is considerable force in the descent of a paviour's rammer; but anything like airiness or aroma of wit, or the fineness of

touch natural to a keen rapier in a delicate hand, is markedly wanting. The subtle Italian or the sparkling Frenchman would scarcely call such work satire at all, but simply abuse: it proceeds, not by way of deadly insinuation, but of rude blurting-out. The whole volume moreover is essentially insular. Besides the English works, in overwhelming majority, there are a goodish number of Dutch examples, and here and there some few from France and Germany: of Spanish or Italian I remember not one. Even the foreign specimens are generally concerned with England, in whole or in part: the English ones that deal with continental matters hardly go beyond the relation of these to home-interests. Of course, this characteristic quality of the series depends partly on the haphazard nature of the collections in the British Museum, as well as partly on the actual spirit of satirical work in the periods under review.

A few points of detail—sometimes of objection—may now be added, with reference to the materials and arrangement of the Catalogue.

The several items are given according to an order of dates which is at first a little startling to the reader, *i. e.* the determining date is that of the earliest event illustrated by the print or drawing. Thus a print of the Spanish Armada and the Gunpowder Plot is assigned to 1588, the year of the Armada; although it is obvious that the work cannot have been executed earlier than 1605, the year of the Gunpowder Plot, and its earliest date of publication was 1621. Thus again a number of prints from *Hudibras* (they amount to no fewer than 196) are all assigned to "circa 1645," because that is about the period of the presumed action of the poem; whereas the poem itself was never published till 1663, and the prints are of all sorts of dates, some quite recent. This arrangement consults the convenience of the historical rather than the artistic student, and is so far conformable to the general scheme of the work; it has also a special adaptation to the requirement, frequently needing to be attended to, of tracing designs from their earliest to their latest form, and may perhaps, in the long run, be the most manageable plan. Yet sometimes (very rarely) this principle of dating is violated. The story of Dr. Faustus is dated 1650, and again 1675, and a portrait of Charles II. at an early period of his reign is dated circa 1685; years which can only indicate when the prints were produced.

In giving the titles of the respective designs, certain variations of typography have been adopted, so as to show whether the title does or does not come from the engraved margin of the work. There is no such distinction, however, marking the titles which the cataloguer has himself invented; only the reader's acumen can discriminate these. This might readily have been obviated. Awkward in like manner is the designation of "No. 2, No. 6," which (with other similar instances) we find applied to an engraving. It means, "item No. 6, being example No. 2 of a particular design;" but might be more distinctively expressed. Mr. Stephens also makes it a point of conscience or of system to repeat dates, in his cross-references, in a manner which appears to be mere surplusage of a vexatious kind. Thus we find, "see 'No Plot, No Powder, 1623,' Nov. 5, 1623, No. 95, 1623," the reference being all to one and the same item; or, "see 'November the 5th, 1605,' Nov. 5, 1605, No. 64, 1605." The practice with regard to expurgation is not always consistent. In the quotation to design No. 5, certain words (which one may guess to be rather downright than strictly indecent) are omitted; whereas a truly nasty quotation to No. 843 is left as it stands, and a decided obscenity (the *double entendre* of which may possibly, however, have escaped the compiler's observation) is reproduced to No. 158. A point of much greater importance than all these is the fact that a large number of designs are included which cannot with any accuracy be termed "Political and Personal Satires" at all. There is nothing satirical in a medal of James I., with the English Church represented under the form of the ark (at any rate, it was not a *conscious* satire); nor in a historical print of the execution of the Gunpowder Conspirators; nor in the portraits of the same offenders, with their punishments; nor in a likeness of Sir Thomas Overbury, or of John Lilburne. Certainly, it may be urged that the reader loses nothing, but the contrary, by the insertion of these works, and many others of similar character; the objection resolves itself into saying either that the title of the book has not been made sufficiently comprehensive or elastic, or else (if other volumes are to be issued, wherein designs of this sort would find their true place) that some deviousness of classification has occurred. It may be noted as remarkable, in passing, that there is not a single design—whether satirical in fact, or satirical by courtesy—directly consequent on the death of Cromwell; four or five subjects have been catalogued in which his ghost is introduced, but of these the earliest dates about eight months later than his decease.

Casual errors are inevitable in an attempt so extensive as this catalogue, and concerned with so many minutiæ. "Hugh Lopez, Earl of Tyrone" (p. 9), must be a mere inadvertent repetition of the name Lopez, correctly occurring just before. Under No. 42, "Invincible Armada and Powder Plot," the verses and some other particulars are repeated from No. 41, if not through oversight, at any rate without apparent advantage. No. 43, a similar subject, appears to be the same as No. 1223, though there is a slight difference in the note of dimensions, and the two are separated by almost the whole bulk of the volume; even if not the same, the dating of No. 1223, "1689," is contrary to the professed system of the Catalogue. Again, No. 40, "A Dutch Medal on the Convention of the Catholic Princes," seems to be the same as No. 48, "Destruction of the Spanish Armada," only taken from a different book, and the re-describing of the subject was needless. In the first instance, the motto is given as "Veni, vidi, vive;" in the second, we find "vide." No. 82 is catalogued as "A Representation of Quackeries, such as those which were alleged to have been practised against Robert Devereux, third Earl of Essex, by 'Doctor Panurgus' (Simon Forman?)." In analysing this engraving at some considerable length, Mr. Stephens shows (I think, conclusively) that it has none of that direct relevancy to the affairs of the Earl of Essex which some previous enquirers have ascribed to it; but Mr. Stephens himself does not appear to go far enough in the contrary direction. There is in reality nothing to suggest that the engraving refers to a medical quack, or actual medical quackeries, in any way. What it shows is "Dr. Panurgus" curing certain mental or moral (not physical) disorders by immaterial remedies: for instance, he cures "proud humours, sly deceits," with "religion, truth, plain-dealing honesty," and his canisters are labelled "modesty, industry, experience," &c. Thus we have before us a moral allegory, and nothing else. Dr. Panurgus ("All-worker") may be understood to symbolize active life, the energetic performance of duties, or indeed moral rectitude and mental discipline of whatsoever kind; and the cures which he works are genuine reforms in the spiritual condition of the patients. In the elaborate exposition which Mr. Stephens gives of Vanderpill's (or R. Stoop's) print, "Magna Britannia Divisa," he refers to the figure described on the print itself as "the English-Italionated lady [saying], 'dimittite nobis debita nostra,' pardon our debts." Mr. Stephens explains that this personage is "Alathea Talbot, Countess of Arundel, whose

speech, 'pardon our debts,' may refer to what Clarendon said of her husband, that his estate, great as it was, did not suffice for the expenses of his æsthetic and other tastes." It is conceivable that some such secondary allusion may be implied in this phrase, as assigned to the Countess of Arundel—at any rate, the suggestion shows Mr. Stephens's ingenuity; but the possible secondary allusion seems to have blinded him to the manifest primary allusion. The phrase is simply the same which we are continually repeating in the Lord's Prayer, "forgive us our trespasses," or, as given in Matthew's Gospel, "forgive us our debts." Further on, in the description of this same print, occur the words, "the French King Louis XIV." which should be "Louis XIII.;" the designer's name, "Cook," to No. 625 (one of the sets from *Hudibras*), ought, no doubt, to be "Clark." The name of Sir Edmundbury Godfrey is always written "Edmund Berry," when the cataloguer acts on his own option; why so is not apparent, for "Edmundbury" is plainly the same name as that of the town in Suffolk otherwise called "Bury St. Edmund's."

It is easy to spy out oversights of this sort, but to avoid them entirely, in such an undertaking, is (as already intimated) not given to man. The inadvertences that I have observed in the book are in fact few, and of no grave importance, and, even were they far more numerous, they would not alter the estimate of the work to which its acute and industrious author is entitled—namely, that it is most useful for study, excellent for reference, and often capital reading, if merely for amusement's sake.

W. M. Rossetti.

A Low-German Æsop. [*Ein Niederdeutscher Aesopus.* Herausgegeben von Hoffmann von Fallersleben.] Berlin: 1870.

A fifteenth century MS. in the Wolfenbüttel library contains a collection of 125 rhymed fables and tales belonging to the 14th century. Out of these the learned veteran of Low-German philology has selected and published twenty of the most attractive in manner, some of which are also new in substance, though not always to the degree which their publisher seems to assume. Thus No. 2, "Der Axtstielsucher," is as old as Esop, ed. Kor. No. 179; see also Heinrich Kurz on Burkhard Waldis, i. 39. For No. 7, "Hahn und Fuchs," cf. Aesop, Kor. 94; Waldis, iv. 87; Benfey's *Pantschatantra*, i. 310, and for a Hottentot equivalent, Bleek's *Reynard the Fox*, No. 12. On No. 9, "Wolf und Rabe," see Marie de France, "Le Corbeau et le Renard," and Waldis, i. 65. For No. 13, "Der Wolf als A-B-C-Schütz," see *Thousand and One Nights*, "The Wise Heykar" (Night 563, xiii. 108, Breslau). For No. 16, "Der kranke Löwe," see Aesop, Kor. 72; Bleek, No. 10. With No. 17, "Der Maul-esel auf Freiersfüssen," compare *Pantschatantra*, iii. 12, and also Benfey, vol. i. § 158. No. 19, "Frauenlist," belongs to a widely spread cycle of tales, for which see Bocc. *Decam.* vii. 9, Dunlop on the same subject, and my note 319 on the latter. Finally, No. 20, "Der Hofbauer als Hofarzt," is Molière's "Médecin malgré lui," the substance of which is borrowed from the Fabliau, "Le Médecin de Brai;" cf. Benfey, *Pantschat.* i. § 212.

Amongst the most remarkable of the fables containing new matter is No. 4, "Die Käfer- und Wolfsfehde," which may very possibly owe its invention to the Middle Ages. The language of the collection is originally Low-German, but mixed with other German dialects by transcribers, as the editor points out in the instructive linguistic explanations with which he has accompanied the text. In addition to these, I should notice one or two words. In No. 2, v. 4, *helve* (Axtstiel) is the English "helve" or "haft;" No. 3, v. 22, *lêr*, Old-Dutch *lier*, "cheek," is found, not indeed in Old-German, but in Old-Norse *hlŷr;* and, finally, No. 4, v. 77, *grevink*, "badger," Danish *greving*, is also connected with the English "gray," which is synonymous of "badger."

Felix Liebrecht.

History of a Town. Edited by M. E. Saltykoff. [*Istoriya odnogo-goroda.*] St. Petersburg: 1870.

This is a book which in spite of its eccentricity, an eccentricity even running somewhat into caricature, will not only be read with pleasure by lovers of humour and of satirical *verve*, but will doubtless be taken into consideration by the future historian of the changes through which the face of Russian society has passed during the last hundred years. Its author, who usually writes under the name of Stchedrine, but whose real name is Saltykoff (a descendant, by the way, of the ancient family of Moscow Boyars of that name), after having, like many other writers suspected of propagating liberal opinions, undergone his time of persecution and of exile under the Emperor Nicholas, acquired a great deal of popularity by the publication, some fifteen years ago, of a series of sketches called *Scenes of Provincial Life* (*Gubernskie Ocherki*), in which he lashed with indomitable vigour the numerous abuses then current under the name of Government and Justice.

Saltykoff's manner as a satirist somewhat resembles that of Juvenal. His laughter is bitter and strident, his raillery not unfrequently insulting. But, as we have already said, his violence often assumes the form of caricature. Now there are two kinds of caricature: that which exaggerates the truth, as with a magnifying glass, but which never entirely alters its nature, and that which more or less consciously deviates from the natural truth and proportion of fact. Saltykoff indulges in the first kind only, the only admissible one. It is the natural consequence of his character: kind and sensitive at bottom, but superficially rude. At the same time he is very delicate in his perceptions, which have something of instinct and divination about them. He has read much, and above all he has seen much. In fact he knows his own country better than any man living. The *History of a Town*—which is in reality a sort of satirical history of Russian society during the second half of the past and the beginning of the present century, under the form of a burlesque description of the town of Glupoff, and of the governors who successively ruled over it from 1762 to 1826—could not well be translated in its entirety, nor do I think that it could be understood or appreciated by a Western public. The "taste of the soil" is too perceptible, and the language too often runs into slang. Frequently too the author allows his fancy to run away with him in a manner quite preposterous. In the series of typical Governors of Glupoff (Dullborough), for instance, there is one who has for his head a *pâté de foie gras*, which is eventually devoured by the "Marshal of the Nobility," a great *gourmand* and lover of truffles. Such absurdities as these, very possibly, have been introduced on purpose, in order to discomfit the over-attentive or official reader.

There is something of Swift in Saltykoff; that serious and grim comedy, that realism—prosaic in its lucidity amidst the wildest play of fancy—and, above all, that constant good sense—I may even say that moderation—kept up in spite of so much violence and exaggeration of form. I have seen audiences thrown into convulsions of laughter by the recital of some of Saltykoff's sketches. There was something almost terrible in that laughter, the public, even while laughing, feeling itself under the lash. I repeat that the *History of a Town* could not be translated as it stands,

but I think that a selection might be made out of the different forms of its Governors which pass before the reader's eyes, sufficient to give an idea to foreigners of the interest excited in Russia by a strange and striking book—one which, under a form necessarily allegorical, offers a picture of Russian history which is, alas! too true. More particularly I would call attention to the sketch of the Governor Ugrium-Burcheeff, in whose face every one has recognised the sinister and repulsive features of Arakcheeff, the all-powerful favourite of Alexander I. during the last years of his reign.

Ivan Tourguèneff.

LITERARY NOTES.

Professor Wilson, in his *Life of Chatterton*, contrary to all other writers, makes bold to assert that Horace Walpole *never received* the letters on painters and painting which Chatterton, in his letter to Mr. Stephens, declares that he *sent*. All the proof he can show is Walpole's own assertion, which may be set against Chatterton's assertion, and so allow further evidence to prevail. Now Chatterton's first letter is very remarkable, because it alone, of all his productions, contains a great many Anglo-Saxon words, all of which he supposes Rowley to use, and all of which he carefully explains. The question as to whether Walpole received this is settled by his *own words*, in the first letter which he wrote to Chatterton. He says:—"I have not the happiness of understanding the Saxon language, and without your learned notes should not have been able to comprehend Rowley's text." When Walpole afterwards ventured on a denial, he quite forgot how much he had already admitted. There is absolutely *no* other writing of Chatterton's to which the expressions he then used can apply. This settles the question as far as the *first* letter is concerned. It may be added that it is duly addressed, has evidently been sealed, and bears what I suppose to be post-marks.

That Walpole received the *second* letter is extremely probable from his objecting to the word *glum*, which occurs in the poem on "Warre" in the second letter. Professor Wilson assumes that Chatterton merely sent the piece called "Nigelle" *instead* of the second letter. But it may have been sent *after* it, along with "Elinoure and Juga," which was certainly enclosed in the *third* letter. Walpole convicts himself as regards the first letter, and therefore there is no reason to believe him as to the second, especially as, by remarking upon *glum*, he partly admits it. The mutilation of the second letter (never yet accounted for) I attribute to Walpole. It was done in order to cut out the last eight lines of the first stanza. These lines are now found scribbled on the back of the *first* letter. It would be interesting to know if they are in Walpole's writing. They are certainly not in Chatterton's.

Walter W. Skeat.

Miss Rossetti (Maria F.) has recently completed a work entitled *A Shadow of Dante; being an Essay towards studying himself, his World, and Pilgrimage.* The title indicates the general character of the book, which might be described as an account of the *Divina Commedia*, according to the author's constructive plan of thought and of cosmology, and with a special aim to qualify readers, as yet unacquainted with the poem, to enter upon the perusal and study of it. Many translated extracts from the *Commedia* are introduced.

Mr. J. Payne has a little book called *Intaglios* almost ready. It is a collection of about eighty sonnets, all (with a very few exceptions) contemporary with the poems in *The Masque of Shadows, &c.* (see *Academy*, No. 17), *i.e.* written mainly in 1868 and 1869. He purposes, in the autumn of this year, to publish a volume of Ballads and Lyrics, completing *The House of Dreams*, and has also in progress a volume of Romances in verse.

A project is entertained in Dublin, of starting a middle-class magazine, to meet the requirements of the ordinary reading public there. It is proposed to be a shilling magazine, published monthly. The prospectus has not yet been issued, nor has the title transpired; but an announcement on the subject will probably appear in the course of a few days. The name of Mr. Martin Haverty is mentioned in connection with the editorship of the magazine. Notwithstanding the influence of his name in Irish literary circles, however, the success of a magazine of the character contemplated is more than doubtful at present.

The island of Sicily seems to be very fairly supplied with newspapers. Not fewer than a hundred journals, daily, weekly, fortnightly, and monthly, are published in Sicily, thirty-eight in Palermo itself, thirteen in Messina, seven or eight in Catania, five in Syracuse, a large portion of them more or less scientific or literary. In Palermo alone, omitting the commercial periodicals, there are five journals for medicine, two for literature, one for architecture, two for art, and one for jurisprudence.

The *Augsburg Gazette* for Feb. 11 contains a review of *Les prétendues Maîtresses de Dante*, by M. Bergmann of Strasburg, in which the writer strives to dissipate the imputations which have rested on Dante's character since Boccaccio's time, who in his gossiping and untrustworthy life of the great poet describes him as throughout his life inclined to sexual indulgence. M. Bergmann lays great stress on the improbability of one so profoundly versed in metaphysical and theological speculations being given up to a passion so destructive to abstract thought, and then proceeds to examine the stories relating to his amours, and shows that they are legendary, and that in some instances the names of his supposed mistresses are fictitious, and derived from misunderstandings of passages in his works. He considers the *donna gentile* of the *Vita Nuova* to have been none other than his wife Gemma Donati, and discredits the stories of the unhappiness of his married life. In this last point, we may observe, he is supported by Dante's latest biographer, M. Scartazzini (*Dante Alighieri, seine Zeit, sein Leben und seine Werke*, Biel. 1869), who, however, considers that the poet passed through a period of moral aberration subsequently to Beatrice's death. The reviewer regards M. Bergmann as having proved his point, and thereby rendered a service to literature by clearing the character of one who in his writings is one of the chastest of men.

A new magazine has always to find an excuse for existing besides the reason that it contains good articles. The *Dark Blue* finds this excuse in its connection with Oxford, which otherwise can hardly be said to affect its character, though it is conspicuously proclaimed by the cover, which is prettily drawn but not pleasantly coloured. It starts with three serials, of which the Frithiof Saga, translated by Mr. Morris, is decidedly the most inviting. The story is interesting both in itself and for its curious parallelisms with other mythical legends. The scene of Mr. Freund's romance is laid in Torgau, and its subject, the conflict between militarism and liberalism, has the merit of *àpropos*. Mr. Lang's paper on Théophile Gautier is delightfully lucid and adequate. Mr. Hughes' recollections of Harvard are fresh and picturesque. The rest of the number is up to the magazine average, and Mr. Gilbert's quaint little story is rather above it.

Mr. Browning's poem, "Hervé Riel," in the March number of the *Cornhill* is perhaps less striking than its subject. The story how a common Breton sailor saved Damfreville's squadron after La Hogue is told with picturesque and breathless energy, and the paradoxical modesty which was taken at its word receives its full effect. But as the character was too simple for analysis, Mr. Browning's special power hardly finds a field. Perhaps the most curious thing about the poem is the reflection it suggests, that the picturesque of Mr. Longfellow when he lays aside his sentiment approximates to the picturesque of Mr. Browning when he lays aside his subtlety.

Art and Archæology.

REMAINS OF CHRISTIAN ART AT NAPLES.

The history of the Neapolitan kingdom is so intimately blended with that of the Popes that we can scarcely separate one from the other, at least during several centuries. The Anjou princes, invited by Urban IV. and Clement IV. to assume the crown of the "Two Sicilies," crushed out and succeeded to the Hohen-

staufen dynasty, 1266-8. Till the time of King Robert, styled "The Wise" (1309-43), those foreign rulers won little affection or loyalty from their Italian subjects. King Robert, the grandson of Charles I., was pious, munificent, and, for his time, learned, being the friend and enthusiastic admirer of Petrarch. To those Anjou princes, between the latter years of the 13th and middle of the next century, is due the introduction of the French Gothic architecture, and of much that tended to refine taste and promote artistic movement at Naples. The churches which still rank conspicuous were mostly founded by them; and their monuments are still the most interesting objects within those sacred buildings. We may particularise the cathedral, commenced from the designs of Masuccio I., under Charles I., in 1272; S. Lorenzo, founded by the same king to commemorate his victory over Manfred at Benevento, 1266; S. Domenico, founded by Charles II., 1285, and designed by the same Masuccio; also S. Chiara, the church of royal sepulture, founded by King Robert, 1310, with the architecture of the second Masuccio. The long reign of the beautiful and unfortunate Joanna I., grand-daughter of Robert (1343-82), and the short one of her successor, who caused her to be assassinated, Charles of Durazzo—himself cut off by violent death, 1386—left little in the artistic or monumental range except the Gothic church of S. Giovanni Carbonaro, the "Incoronata," or *capella regis*, of King Robert, amplified into a church to commemorate the second marriage of Joanna, celebrated within its walls; and also several sculptured tombs of royal personages in different churches. The stormy period of King Ladislaus (1386-1414), son of the Durazzo Charles, is brought to mind only by the anomalous and complex, but magnificent, monument raised to him in the above-named S. Giovanni (a church which he restored or rebuilt in 1400), by his sister and successor, Joanna II. Besides this masterpiece of its artist, Andrea Ciccione, there is little else to remind us of that licentious queen except some examples of the florid Gothic carried to its richest development at Naples in the 15th century: for instance, the portal of a small church adjoining a larger one, both dedicated to S. John, the work of the architect Antonio Baboccio, 1415; the same who designed the superb portal of the "Duomo" for the façade renewed in 1407. Also—a tragic record of Joanna's reign—the monument at S. Giovanni Carbonaro of her long-potent favourite, the Grand Seneschal Sergianni Caracciolo, who was assassinated 1432; this tomb being also by Ciccione, who represents the murdered man in a statue standing erect with a dagger in his hand.

Alfonso of Aragon, the successor of Joanna II., completed the sternly picturesque Castel Nuovo, begun by Charles I. in 1283. After his death (1458) was raised to his memory (1470) the triumphal arch unsuitably wedged in between two huge towers of that fortress; and, though as ill-placed as possible, a striking example of the Renaissance architecture and sculpture of this century. Vasari ascribes it to Guiliano da Majano; others, to Pietro di Martino, a Milanese; but the elaborate reliefs are by four other artists—one of them, Andrea Fiorentino, a pupil of Donatello. After the overthrow of the Aragonese dynasty in the person of the ill-used Frederick II. (1501) came the period of the Spanish Viceroys, marked, in the monumental sphere, by the worst possible taste and almost every outrage against just principles of art. The Aragonese period had been illustrated by the brightest stars of the Neapolitan school: in sculpture, Andrea Ciccione and Giovanni Morliano da Nola (1478-1559); in painting, Agnolo Franco (ob. 1445), Nicola del Fiore (1444); and Antonio Solario, called *lo Zingaro* (1455). Even the Spanish government, otherwise so prejudicial and discredited, saw contemporaneous energies in this local school, attested by the finest works of that sculptor known as "Giovanni da Nola," also by the paintings of Andrea Sabbatini, a pupil of Raffaello, and only to be appreciated at Naples; and in the 17th century by those of Corenzio, Ribera, Stanzione (called the Guido of this city), and Salvator Rosa. The vandalism of Spanish officials, dealing with mediæval art-monuments, was on a par with the frightful vulgarity of the works they ordered. One of them caused the frescoes by Giotto in S. Chiara—Scriptural subjects, and several from the Apocalypse treated, it is said, according to suggestions of Dante—to be covered with whitewash, because they made that church-interior look gloomy! A faded group of the Pietà, and a Madonna head, over an altar, alone remain visible on these walls; and it would be well if means were taken to rescue the other paintings, still probably extant, however damaged, of the same valuable series. In the same church the splendid monument of King Robert, designed, while he yet lived, by Masuccio II., but not finished till 1350, is almost concealed behind the barocco ornaments of a high altar set up in the last century; and it is only by ascending a scaffold that one can obtain any idea of the character or elaboration of this extraordinary work. In a hall once belonging to the S. Chiara Convent, but now used as a furniture-shop, is the admirable fresco, ascribed to Giotto, of the Saviour in glory amidst saints, with another saintly group below, and baskets of loaves in the foreground—probably a mystic representation of the almsgiving of the Franciscan Order (to whom this convent still belongs), as pre-figured by the miracle of loaves and fishes. Messrs. Crowe and Cavalcaselle were, I believe, the first writers to make known the existence of this long-forgotten picture. In order to see it, I had to climb up a ladder to a rickety scaffold, and beg the good man of the shop to sweep away ever so much piled-up furniture for my benefit. S. Lorenzo, built from the Gothic designs of Maglione, a pupil of Nicola Pisano, has been wretchedly modernised. Its finest feature still preserved, one rarely seen in Italian church-architecture, is a *chevet* consisting of seven chapels concentrically disposed beyond the tribunes, five of which chapels are cut off by partition-walls, left almost ruinous, and so dark that their contents can scarcely be seen, while one is encumbered with the mutilated statues of warriors, thrown on the floor from their outraged monuments! I cannot say much for another modernisation, intended to be in harmony with the original Gothic, at S. Domenico, a church of imposing aspect, and most rich in monumental sculptures of the 14th and 15th centuries. It was redecorated, in almost every part, 1850-3, and with a profusion of colour and gilding detrimental, I thought, to the severe majesty of the prevailing style of this church.

There are a few remains of primitive Christian art at Naples; none at present in satisfactory conditions. The circular baptistery adjoining S. Restituta (itself a separate basilica, now entered from the cathedral, but much more ancient than that Anjou edifice) has a dome covered with mosaics, feebly restored in painting; some figures of saints in white robes, offering crowns, reminding of the Roman and Ravenna's mosaic works; others apparently much later—perhaps 12th century. All are faded; the building, no longer used, being left in woeful disorder and squalor. An inscription under its dome informs us that this baptistery was founded by Constantine, A.D. 343, and consecrated by S. Sylvester. That emperor died A.D. 337! It is possible that the origin may have been coeval with that of the ancient Neapolitan "Duomo," called from its founder *Stephania*, which was rebuilt on a larger scale in 790, after it had been burnt down on the night of Easter.

The catacombs of San Gennaro have not been explored to their full extent, nor for many years worked with a view to discovery. They are said to have been re-opened in the 11th century (?), after being long forgotten, being entered from an oratory in which the body of S. Januarius was laid in the 3rd century. That primitive chapel, excavated in the volcanic tufa, is still accessible, and retains its ancient altar (hidden within a modern one), besides the saint's episcopal chair, also cut out of the solid tufa. There are three stories of corridors; the lowest being filled with soil and bones, those of victims of the plague which visited Naples 1656. On the highest story we enter a spacious church, with square pilasters and flattened roof, all alike excavated. Few paintings are seen in any part of these hypogees to which the visitor is guided: the most remarkable being a figure of the Saviour blessing (of youthful aspect, but not like the earliest type), the Madonna, a veiled matron, on the archivolt above, and the heads alone of SS. Peter and Paul, whose figures are lost. After reading the report by the Cav. di Rossi of these catacombs, one is disappointed with their realitiess; and I could recognise no indication of antiquity higher than the 7th or 8th century. The inscriptions, which are all Christian, have been placed in the epigraphic collection at the National Museum.

The suppression of monasteries has led to the closing or secularising of several churches at Naples, and to the transfer of art-works from their walls to that great Museum, where they can be seen to more advantage. S. Martino, the gorgeous

Carthusian church, on the high terrace immediately overlooked by the S. Elmo fortress, is placed on the footing of a public gallery, open eight hours daily, but no longer appropriated to any religious uses. A soldier conducts us through its mosaic-inlaid chapels and stately cloisters; and the seven monks, residue of the Carthusian community, who still reside here, are banished to a wing on the premises; their worship being held in a private oratory. The immense monastery of S. Severino, suppressed by the French in 1797, and during some years anterior to 1860 inhabited only by eight or nine Benedictine monks—the chief part of the premises converted into a marine college—is now assigned to other uses, and contains the entire "Archivio" of the State (Neapolitan), a well classified collection, open to students three hours daily. In one of the spacious cloisters is the admirable fresco series by Lo Zingaro, eighteen pictures illustrating the life of S. Benedict—somewhat injured by retouching, but still a noble evidence of the imaginative power and technical skill attained by art in the 15th century. The various architectural details, in the background of these frescoes, &c., exhibit the Renaissance free from all Gothic traditions. Not one, however, of the 340 churches and chapels in Naples has recently suffered any alteration to be regretted from the æsthetic point of view—if from the devotional. The change has been in the right direction so far as affects artistic interests, and attended with less violent dislocation than might have been expected from a government which went so far as to banish all the Madonna shrines from the streets of a city whose populace are pre-eminently addicted to the cultus of images. We see in much better light, where it now hangs in the Museum, the picture formerly at S. Antonio Abbate (a small old church now closed), by Lo Zingaro, one of his masterpieces, containing, beside a sacred group, his own portrait and that of the fair wife, Antonio del Fiore's daughter, to win whom he abandoned the trade of a tinker. In the same gallery hangs the finely truthful picture by Van Eyck, painted for, and removed hither from, S. Lorenzo—"S. Jerome in his study extracting a thorn from the lion's foot." From the cloisters of that suppressed convent has been removed, to be elsewhere set up within public view (I believe in the Museum), a monument executed, in 1414, by Baboccio, one of the best examples of his imaginative power and elaborate finish. In the mediæval compartment of that Museum is seen an altar-piece presented by Joanna II. to S. Giovanni Carbonaro—in seven compartments, representing the story of the Passion and Resurrection, with numerous figures, in alabaster alto-relievo, profusely gilt, almost grotesque, and of clumsy design, but curiously displaying the phase reached by local art at the time of Ladislaus' reign.

Neapolitan art has had comparatively little influence or repute in modern ages. The different phases through which we have followed its development convey, it is true, a most noticeable moral meaning—a proof of the deteriorating influence which absolute government exercises on the general character of art. Noble simplicity and dignity vanish before the sumptuous, the elaborately splendid. Even the solemnity of Death is disturbed by the glare of courts. The effigy of the Ruler is seated at the apex, as protagonist, still surrounded with obsequious courtiers and palace pomps. In one instance the relief on the monument of Charles "the Illustrious," Duke of Calabria, and son of King Robert) even a prince who never reigned is attended by satellites who all kneel to him. The tendencies manifest in Neapolitan art increase its value from an historical point of view, and make the careful preservation and, if necessary, restoration of its remaining monuments the more desirable. A catalogue of the National Museum, in five parts, is now published; and among other recent publications of this city I may notice the new series of the *Giornale degli Scavi di Pompei;* also the *Scovorte archeologiche fatte in Italia dal* '46 *al* '66.

C. I. Hemans.

ADDITIONS TO THE SOUTH KENSINGTON MUSEUM.

This vast collection, now so much visited by the public, continues to grow, and during last year made a considerable number of additions, some by gift or bequest, as, for instance, the pictures left by Mr. Parsons just lately exhibited, and others by purchase. Many of these additions were necessary to fill up the continuity of specimens in certain classes of objects and kinds of decorated manufactures. Others are important in themselves as rare and excellent art. We may direct attention to the principal of these.

1. A Limoges Enamel of Christ mocked, and crowned with thorns. This is one of the most elaborate and perfect examples of French enamel. It is not large, 9¼ inches by 7⅝, but of extraordinary splendour of colour, heightened with gold. The design is mainly taken from Albert Dürer, the original composition being reversed. This fact ought to be mentioned on the descriptive label attached. The original is one of the set of designs known as the "Little Passion on Copper."

2. Twenty-nine pieces of Spanish Jewellery. These are filagrees enamelled and set with precious stones, and are of various character, but principally ornaments for the ears, neck, and breast, pendants, aigrettes, and bouquets; among the rest is a bauble for a Bambino, the whole collection having belonged to the treasury of the Virgen del Pilar, Saragossa. They all belong to the same style and nearly to the same period, the 17th century and beginning of the 18th, and have been votive, presented by ladies for the most part, Doña Juana Ravasa and others, and by Louis XIII. of France. The workmanship of these objects is of the finest and most elaborate description, but the art is gaudy and vulgar to an extraordinary degree.

3. Large collection of French Faience, filling three cases in the Keramic Gallery. These are described as the "Aigoin collection," and were bought from that family in Spain. One case is filled with the manufacture of Nevers; an imitative fabrique, some specimens resembling Dutch, others Chinese, and many having a great similarity to Limoges enamels, being white or yellow flowers and ornaments painted on a dark blue, *Bleu-de-Perse,* ground. The other cases contain principally Rouen ware, a ware of a cold white ground, and rich but not very good ornamentation, mostly in blue, but also in other colours. The clay is of a light brown, but the cold white glaze very thick. They belong to the time of Louis XIV. and XV. Among these Rouen examples there are, however, a number in very good style and of fine execution.

In the neighbourhood of these cases is also one containing (with other things) about twenty Spanish (Rambla) terracotta light clay vessels; biberons, pilgrim's bottles, jugs, &c., sent and presented by Mr. Layard since his residence in Spain. These are very correct in shape, but remarkably bad in the ornament, which is stuck on like the decorations on confectioners' bride-cakes.

4. A collection of fifty-one pieces of Italo-Greek terracottas, consisting of vases, &c. This is perhaps the most interesting of all the additions, and fills two cases in the Keramic Gallery. Certainly as art these are utterly beyond all the others. Among them two series (at least they are now arranged in two circles) of hunting figures, mounted and running on foot, with dogs pursuing deer and other animals, lovely and full of life, giving a wonderful impression of the powers of design so widely spread among the Greek colonists, that casual provincial decorations should be found so perfect. These figures came from a tomb near Canosa, South Italy, and are presumably about B.C. 200. The nude portions of these models have been painted flesh colour, and the deer have been painted brown, but the draperies, horses, and other parts seem to have been left white. The hair of the men has not been painted except by flesh-colour. There is also a fine vase of the Ascos kind, of great beauty, found in the same tomb.

5. Italian chimney-piece of inlaid marble. The ornament consists of thin bright scrolls and grotesques on a white Carrara ground. The chimney-piece rises in a pedimental shape to a termination fitted for a statue or group.

6. A priest's vestments, viz. chasuble, stole, maniple, and corporal, made of scarlet silk covered with lace. The excellence of the design of the lace makes this set of vestments worthy of notice. It is probably Spanish, and, if so, is the best of Spanish work we have noticed.

7. A Dutch clock of the late 17th century. This is a very ornate and at the same time noble specimen of the jeweller's art. It is made of gilt metal, decorated with silver repoussé, pierced and filagree work, and is inscribed "Brechtel fecit, Hagae." The entire object is not large, the extreme height being 3 ft. 1 in. Round the base are twelve plaques representing the Seasons, excellent small relievos, and above them a splayed moulding covered with festoons. The body of the clock is recessed by four arches supported by Corinthian filagree columns. Within these arches are the dials. On the top are eight statuettes of

Olympian gods, and a cupola, which these surround, rises considerably higher, decorated with the signs of the Zodiac very worthily done. The termination of all is a figure of time. This superb specimen of Dutch silversmith's art cost 1200*l.*

We shall record other additions from time to time.

W. B. Scott.

ART NOTES.

A correspondent reminds us that the death of Cornelius (see *Academy*, No. 18) took place on March 7, 1867. He was born at Düsseldorf in 1784, and was consequently at the time of his death in his 84th year.

A recent discovery of coins at Priene is of peculiar archæological importance. The site of the temple of Athene Polias in that city yielded to the explorations of the Dilettanti Society two years ago many valuable fragments, which are now in the British Museum. Among these is a valuable collection of inscriptions, one of which proves the temple to have been originally dedicated by Alexander the Great; and some fragments of architecture and sculpture, the style of which, following closely that of the mausoleum sculptures, appears to tally well with the date thus indicated. The pedestal of the colossal statue of the goddess had also been found intact, with a fragment of a hand, and two feet of smaller scale and peculiarly exquisite workmanship, showing that the temple had contained two colossi, one of about twenty-four and the other of about twelve feet high, either of which might have been that for which the pedestal was designed. In the course of last spring the exposed pavement and pedestal were broken to pieces; and under the lowest course of the pedestal were found five silver tetradrachm coins, bearing the stamp and effigy of Orophernes, and on the reverse a Victory. This can be no other than Orophernes II. (Nitrephoros), the supposititious son of Antiochis, and elder brother of Ariarethes, who with the help of Demetrius supplanted the latter as king of Cappadocia, B.C. 157, and who is recorded to have deposited with the citizens of Priene a sum of four hundred talents. It would seem that the coins found under the pedestal must have been placed there when it was constructed, and thus point to a date, for it and its statue, some hundred and seventy years later than that of the first dedication of the temple.* One of these coins was presented to the British Museum, and another to the Dilettanti Society, by their discoverer, Mr. Clark, a gentleman who resides in Asia Minor, near Priene.

Previous to the outbreak of the war between France and Germany the Prussian and Bavarian governments were involved in litigation on the subject of the ownership of certain pictures; the former claiming to have restored to them certain portions of the Munich Gallery which they affirmed had been unrighteously acquired from the old Düsseldorf Collection; the latter disputing the validity of the Prussian demands. The settlement of this dispute is due to the withdrawal of Prussia from the contest, the authorities at Berlin, no doubt, considering it unseemly to proceed any further in the matter after Bavaria had joined its fortunes to those of the rest of the German Federation.

It has been stated on semi-official authority that a claim will be made on the part of Prussia to some of the pictures belonging to the old electorate of Cassel, and still preserved in the national collections of France.

The gallery of Prince Esterhazy, which for many years was on view at Vienna, and more recently had been transferred to the Hungarian capital, has been bought for the Hungarian nation for 1,300,000 florins, and will remain at Pesth. It comprises pictures, prints, and original drawings, and would, but for the war, have been brought to the hammer in Paris.

Moritz von Schwind, a favourite painter of the Munich school, died at Munich on the 9th of February. He was born at Vienna in 1804, and had just entered on his 68th year. The Germans, who have a natural fondness for the display of legends of the knightly times, were very fond of Moritz von Schwind's works. The poetical combination of heroic and fairy lore in the "Seven Ravens" at Weimar were much to the taste of the public which the painter had to consult. Other noteworthy frescoes by the same hand are those illustrating the history of Elisabeth of Thuringia, and the local traditions of the old castle of the Wartburg, near Eisenach.

A portrait of Mr. Clabburn of Norwich, painted by Mr. Sandys, has been on view at Messrs. Graves's, Pall Mall East. It is life-sized three-quarters length, and presents the subject standing bareheaded in the open air, with a rich background of foliage and distance. The work is remarkably fine, both in point of view and in technical attainment, and presents in some respects an interesting analogy to the quality of old portrait-painting, as it was practised in the sixteenth century, combined with the style in which Mr. Sandys is individually eminent.

The *Pall Mall Gazette* gives the following list of pictures bought by the National Gallery during last year, from the report of the director:—A picture by David Teniers of "An Old Woman peeling a Pear;" "Saint Peter Martyr," the portrait of a Dominican monk, by Giovanni Bellini, imported from Milan; "The Procession to Calvary," by Boccaccio Boccaccino, imported from Milan; "The Madonna and Infant Christ, the Youthful Baptist, and Angels," an unfinished picture, ascribed to Michelangelo; an altar-piece by Giambattista Cima da Conegliano, representing "The Incredulity of St. Thomas."

A French correspondent of the *Pall Mall Gazette* gives a list of the statues inside the Cathedral of St. Denis which have been injured by carelessness, bombardment, or pillage. The most curious accident is certainly that which happened to St. Denis. The statue of the good saint, who is popularly supposed to have crossed a river with his head under his arm, was decapitated by a shell. The statue of Catherine de Medicis has two fingers cut off and stolen, and a gash from a sabre on her hands. Henry II. has lost not only two fingers, but the big toe of his right foot; Charles VI. his right hand; Duguesclin the hilt of his dagger; Charles V. both hands and his sceptre; Charles Martel a finger; Pepin le Bref has had his sceptre broken; and Louis XVI., besides receiving a cut across the nose, has been deprived of both his thumbs.

The *Preussische Jahrbücher* for February contains a very interesting article by Conze on "ancient sepulchral monuments." Its chief point is to describe critically the rows of monuments existing at Athens in a nearly intact state, on either side of a street of the ancient city first discovered in 1861, and since gradually excavated. This street is situated south of the church of the Agia Triada, near the ancient Dipylon or gate upon the road to the Academian olive-groves. The author speaks of the monuments as belonging to various periods, some to the very finest, and as affording in their decorations a further proof of the universality of the practice of combining relief-sculpture with painting.

An article in the *Augsburg Gazette* of February 13 gives some valuable but still insufficient particulars in reference to the famous Madonna del Popolo (otherwise called di Loreto) of Raphael. Of this picture there exist something like twenty repetitions, among which the sole original is now conclusively declared to be the panel in the possession of Oberstlieutenant Pfau, at the castle of Kyburg, near Winterthur, in the Swiss Tyrol. This appears to have passed, in a manner leaving ample scope for conjecture, out of the possession of the Cardinal Sfondrato (ob. 1618) into that of the Ferrari family which settled at Innspruck in the suite of Claudia dei Medici, the wife of Leopold, Count of Tyrol, about 1626. It had suffered various ill-usage; and after a careful restoration by Herr Eigner, was exhibited publicly at Augsburg, and authoritatively pronounced original by Dr. Waagen in 1867.

In the *Kölnische Zeitung* for February 10, and again in the supplement to the *Zeitschrift für bildende Kunst* for

* It is worthy of note that the name of this king, as it appears on these coins, is Orophernes, not Olophernes, as it is written in the received texts of ancient authors.

February 17, is published a protest or explanation on the part of the Berlin Society of Artists, in reference to the second part of an instruction addressed to that body by the notorious von Mühler, Minister of Education in Prussia. Shocked at observing sacred and profane subjects hung side by side in last year's exhibition — a picture of Venus next a picture of the Virgin, and a Christ next a Callisto — the minister solemnly warns the society to avoid such improprieties in future; speaks at length about the paramount importance of the "moral purport" of a picture, its "admissibility before the forum of public morality;" and enacts that "paintings which, without deeper spiritual import, have their value essentially in nothing but the treatment of naked flesh, so far as they find acceptance at all, shall certainly not be placed just in a position of marked prominence, and shall least of all be brought in immediate contact with pictures which inspire to serious and sacred contemplation." The protest of the society against this absurdity is made with spirit and dignity. They maintain that the exhibition is precisely the place where no other interests but those of art are to be considered, adding that "whoever visits the rooms for any other purpose, be it sacred or profane, has no one but himself to blame if he finds himself dissatisfied." They point out the peculiar view of art according to which the chance juxtaposition of pictures would imply artistic liberty, and appeal to the traditions of Frederick William IV., "a prince who was both religious and artistic, but yet knew how to keep the interests of art and religion separate to the benefit of both."

The series of papers by F. W. Unger on "the German cathedral-architects of Prague and Milan" is concluded in the last number of the *Zeitschrift für bildende Kunst*. The supplement to the same periodical has a long obituary notice of Professor Feodor Diez, court painter in the Grand Duchy of Baden, who died (in his 58th year) of heart disease on his way home from Gray. He had accompanied the army as a volunteer in the ambulance service.

The arduous and most important charge of purchasing for the national collection of pictures is vacant through the resignation of Mr. Boxall, who, it is understood, is about to be knighted.

The *Corriere dell' Umbria* of the 9th announces the recovery of the small picture by Raphael which had been stolen from the sacristy of S. Pietro at Perugia.

The bronze lions cast for the sarcophagus of Manin the Venetian patriot have been completed under the direction of the artist De Micheli.

A Spanish periodical, *Revista de Archivos, Bibliotecas y Museos*, the first number of which appeared on the 31st of last January, is to be published monthly at Madrid, with the object of supplying information respecting subjects connected with Spanish archæology and history. It is to discuss all questions relating to the administration of the archives, libraries, and museums of Spain, to announce publications, to report on the organization of these institutions, and on their acquisitions, and to insert notices and questions from correspondents. The editorial staff consists of officials connected with the national libraries and museums, so that the information thus supplied will be authentic and valuable.

The following interesting pieces of information are given:—

The work of classifying and cataloguing the national archæological museum is reported to be making good progress; and the collection will be very rich, for, in spite of the numerous robberies of works of art that have taken place in Spain, her monumental and artistic wealth is still great.

The splendid collection of ancient Peruvian pottery in the archæological museum at Madrid is now arranged and open to public inspection.

The Spanish government are in treaty for the purchase of the Greek and Roman antiquities belonging to the Marquis of Salamanca, a very fine collection of bronzes and marbles, which will be placed in the national archæological museum.

Music.

Dido and Æneas, a Dramatic Cantata, written by Nahum Tate, composed by Henry Purcell. Edited from a Collation of several MS. Scores, with Preface, and an Accompaniment for the Pianoforte, by Edward F. Rimbault. London: Metzler and Co.

This work, the earliest essay in its kind of the most celebrated of English musicians, and altogether one of the most interesting of musical monuments, had remained in manuscript from the year of its production, 1680, to 1841, when it was printed in full score by the Musical Antiquarian Society. In the last decade of its second century it is for the first time rendered generally accessible to the countryman of the composer by the present publication—one of the most valuable of the many valuable contributions to our stock of materials for a history of English music which have been made by the editor, Dr. Rimbault. Lovers, and even closer students, of music are little accustomed to qualify their judgments of musical works by considerations of the times and circumstances at and under which they have been produced. Indeed, for the most part, they know nothing about either. The epithets "ancient" and "modern," fairly well understood as applied to the other arts, convey no definite impression when they are applied to music. If Palestrina is an ancient so is Haydn—who flourished two centuries after him. But the least instructed or the least considerate amateur cannot fail to be struck by such a phenomenon—when it is fairly set before him—as an opera, not merely abounding in individual passages and even entire movements of extraordinary beauty, but constructed on principles accepted by the most recent masters—the dialogue conveyed in recitative or *aria parlante*, sustained individual emotion expressed in *aria*, and simultaneous action in concerted pieces—composed a hundred and ninety years ago, by a youth scarcely out of his teens, who by no possibility could ever have assisted at the performance of any similar work. No doubt some of the scores of Lully, in manuscript or even in print, had ere this found their way across the Channel; and it is certain that, through his pupil Pelham Humphrys, a considerable acquaintance with the then prevailing French—and therefore Italian—manner had been spread in this country. The fact nevertheless remains that no earlier or contemporary musical work by an English composer worthy for a moment to be put in comparison with *Dido and Æneas* has come down to us; and that whether for its wealth of musical idea or the judgment with which this is turned to account in the production of dramatic effect, the work remains among English operas unsurpassed, if not unequalled, except by its own author.

The libretto is by Nahum Tate, the fellow-labourer of Nicholas Brady in the "new version" of the Psalms of David—a work which, in spite of many shortcomings, has enjoyed a term of use and favour only now coming to an end. The verse of *Dido and Æneas*—after the manner of Tate—is flat, prosaic, and unsuggestive enough, with here and there a good line.

The lyric dramas of Quinault have outlived the music of Lully; some of those of Metastasio are among the masterpieces of Italian literature. Tate, as a dramatist, owes any life there may still be in him to Purcell, who, like every successful dramatic musician, has addressed himself rather to the emotion or the situation with which he has had to deal than to the form of words in which either may happen to be conveyed. As a canvass for a painter in sound, *Dido and Æneas* is not below average. On the contrary, so much of the story as is dramatically presentable is presented in an orderly and intelligible way; and the

supernatural element, if a little more Gothic than beseems the rest of the drama, is certainly none the less fitted for musical effect. Strange to say, no copy of the libretto has yet been found which indicates its division into scenes or acts. Mr. Macfarren, who edited the Musical Antiquarian Society's publication of the opera, suggested its division into three acts, and each of these again into scenes, the completeness of each of which is indicated by the construction both of the verse and the music. Of these there are seven, the first of which is preceded by an overture, begun by one of those stately *adagios*, models for which Purcell no doubt had made acquaintance with in the works of his elder contemporary Corelli as well as in the "prologues" of Lully, and completed by a short *allegro*, the contrapuntal commencement of which promises more than is performed in it. The curtain rises on "the royal palace of Carthage," and the voice of Anna, "sister of Dido," is heard in a short solo followed by a chorus, addressed to the Carthaginian queen, the character of which will be sufficiently indicated by the first line of the words, "Shake the cloud from off your brow." To this Dido replies, in a song of which the plan indicates the period of its composition, and the execution the taste and skill of its composer. It is built on a "ground bass"; that is, a certain number of bars (in this case, four) are repeated in the lowest instrumental part without intermission, from the beginning to the end of the movement—the only break in the monotony being its transposition into the key of the dominant—in all seventeen times! In spite of this restriction, apparently as incompatible with expression in the melody as with variety in the harmony, so independently does the former move, and so ingeniously is the latter varied, that the song might be, and probably has been, heard by thousands who have remained unconscious that the composer was bound by any laws more stringent than those prescribed by his own fancy. Purcell would seem to have rejoiced in these self-imposed fetters. Another song, not however of equal interest (No. 21), is constructed in the same manner; but in a third, the death song of the heroine (No. 33), he has superimposed on another "ground bass" a melody of unspeakable pathos, and a succession of harmonies richer and rarer than it might have seemed possible to compress into so short a movement, under any or no conditions. This first scene, which includes the well known duet and chorus, "Fear no danger to ensue," brought to an end, the second opens with the entry of "the Trojan guest," between whom and the heroine a colloquy ensues—only rendered supportable by the music in which it is carried on—which is happily interrupted by the animated aria, "Pursue thy conquest, Love," immediately followed by the chorus, "To the hills and the vales," one of the most popular of Purcell's concerted pieces. With the introduction of the supernatural element, the character of the music changes suddenly and entirely. The third scene takes place in "the island of Platea," where "a sorceress is discovered performing her spells." Like the witches of Shakespeare, "who should be women" but for their beards, the sorceress of Purcell is a "bass" singer. This contrivance for inspiring antipathy or terror in the auditory had been resorted to before. The "Medusa" of Lully's *Theseus* is a "tenor," whose utterance, however acute in reference to his real sex, would sound unaccountably grave in reference to the character whose mask he wore. Purcell, however, has not relied wholly or even chiefly on a contrivance which of itself would as soon cease to excite terror as surprise. He relies on the breadth and dignity of the musical phrases to which his sexless creation gives utterance, and on the recondite harmonies by which they are supported—in a word, on his invention and his learning. J. S. Bach and his more recent successors have no doubt familiarised us with many of or all the combinations and progressions which Purcell has employed as well in *Dido and Æneas* as in subsequent compositions, dramatic and other. But *Dido and Æneas* was written and performed five years before J. S. Bach first saw the light; and the career of its inventive and learned composer was brought to an end ere the great German could have mastered the first principles of harmony. Those, however, who have any acquaintance with the works of the best masters (Carissimi above all) of the seventeenth century, will know how few effects of harmony they left to the discovery of those who were to come after them; and of these Purcell, born when Carissimi was probably at least in his seventieth year, was confessedly one. His claim to be regarded as the representative of a musical epoch rests on his invention—on the originality as well as the beauty of his melody, the vigour of his harmony and the justness of his expression. Of these excellencies the work we have been considering—the analysis of even a portion of which has led me further than I had for a moment anticipated—abounds in examples. I must content myself with briefly indicating where a few of the most remarkable of these are to be found. Let the musical reader turn to the introduction to the incantation music (No. 12), of which I have already said so much; to the burst of "distant hunting music"—so cheering by its freshness of key and character—by which it is interrupted; to the song (No. 21), "Oft she visits this loved mountain" (the third of those on a "ground bass"); to the song and the chorus of hunters (No. 23) dispersed by the storm "conjured" by the witches; to the sailors' song and chorus (No. 24); to the chorus (No. 28), "Destruction our delight"; and, once again, to the wail of the dying queen (No. 33), in which pathos and majesty strive for pre-eminence, with the chorus, sweeter in its sadness, "With drooping wings" (No. 34), which ends the work.

In the edition which has suggested these observations, the orchestral parts are, for the first time, in their entirety, arranged for the pianoforte. Both notes and words are neatly and intelligibly printed; and the complete work is issued at something less than half the price of an average shop ballad.

JOHN HULLAH.

NOTES.

The Rev. H. R. Haweis has in the press a two-volume work of musical theory and criticism, being in the main a re-publication of essays which have appeared in the *Contemporary Review* and other periodicals. The work will be divided into four books —Vol. I., Book I., Philosophical; music, emotion, and morals: Book II., Biographical; Introductory, Handel, Gluck, Haydn, Schubert, Chopin, letters of Mozart and Beethoven: Vol. II., Book I., Instrumental; Violins, Pianofortes, Bells, Carillons: Book II., Critical; Professional, Amateur, and Street Music in England.

The success which has attended the revival of Cimarosa's opera *Il Matrimonio Segreto* is pleasantly significant of at least a partial reaction in favour of clearness, simplicity, and refinement in music—none the less so from the fact that its execution by the Italian Opera Buffa Company is far from being a perfect execution, musically or dramatically. Its attractiveness is due, of course, mainly to the reputation of the work itself, as a neatly constructed drama the success of which is carried on by means of tuneful and well constructed music; but the obvious delight manifested by each succeeding audience in its presentation (it has been already four times performed) is due not more to its positive than to its negative qualities; not more to the same neatness of construction than to the fact that the *libretto* does not present a single "sensational" effect; not more to the unintermittent melody, pure and vigorous harmony, and varied

character of the music than because its presentation demands only six singers, and that it is instrumented so that they can be heard; in a word, to the fact that there is *no* chorus on the stage, and that there are *no* trombones, *no cornets-à-pistons*, nor ophicleid, nor *grosse-caisse*, nor any similar instrument of torture in the orchestra. And this, at a moment when the "Albert Hall" is on the point of completion, and an enterprising Bandmaster is said to be engaged in a series of experiments with a view to the systematic reinforcement of basses by means of cannon, the pitch of whose reports, it is believed, may be regulated by the amount of charge put into them.

A good deal of misconception seems to prevail respecting the place of *Il Matrimonio Segreto* in musical history. The popular estimate of it as an "old" work is, though partially correct as to its character, quite the reverse as to its date. The opera is an anachronism, at least from a European point of view. It is a purely Italian opera, the most perfect perhaps of its class, possibly designed, and certainly *coloured*, without reference to or recognition of the prodigious changes which had been wrought in the musical drama during the very last year of his life, by Mozart. At the beginning of the year 1787 Cimarosa, already the composer of nearly seventy operas, "once immortal deemed," but which now, alas! "sleep without a name," left Italy for the court of Catherine II., where he remained till the end of 1792. During this period, of nearly six years, Mozart produced *Don Giovanni*, *Cosi fan Tutte*, *Die Zauberflöte*, and *La Clemenza di Tito*. True, *Idomeneo*, the work in which the revolution of the orchestra was initiated and all but completed by Mozart, was of much earlier date; but few contemporary composers seem to have appreciated its special importance, to the effect at least of following up the route which Mozart had opened up. Whatever effect the acquaintance which Cimarosa must have made with the last works of Mozart on his visit to Vienna in 1792, where and when *Il Matrimonio* was written and produced, may have had on his inventive and constructive powers, they had none whatever on his material. His orchestration betrays not a trace of their influence. *Il Matrimonio Segreto* could not perhaps have been *designed*, but it certainly might have been *scored*, before 1780, the year of the production of *Idomeneo*. The work of the Italian *Maestro* thus presents a curious and indeed unique example of a work of art achieved at the end of a period of unprecedented progress, which, from internal evidence, might be antedated some twelve years, and which yet still keeps the stage, at the end of seventy-eight! Long may it continue to do so; if possible with, and if not without, artists capable of doing justice to its beauties.

As has already been said, the family of Geronimo, *in esse* and *in posse*, is by no means adequately represented on the Lyceum stage. Signor Borella as the fussy, bargaining, yet still kind-hearted head of the house, is admirable, always giving spirit to the dramatic action, and accuracy as well as spirit to the music in which he takes part. Nor could a Carolina more likely to bring about the *imbroglio* of the drama than Madlle. Colombo be found among living artists. In one respect at least she stands almost alone among recent Italian importations, as being not only in possession of a beautiful instrument, but as knowing how to play upon it; as not only having musical intentions, but as being able to make them intelligible; in fact, as being a candidate for vocal fame who has really been taught to sing. To the rest of the company, whom it is needless to mention by name, the credit of the most thorough goodwill must be allotted unsparingly. They have studied their music thoroughly, and play into one another's hands with an amount of confidence and animal spirits which might make amends for more shortcomings than can be fairly attributed to them. The success of *Il Matrimonio Segreto*, like all great theatrical successes, has, it is said, astounded all the people concerned in it to such a degree indeed that Mozart's *Cosi fan Tutte* has been put into active rehearsal, and will be ready for production forthwith.

Mr. Barnett's new cantata of *Paradise and the Peri* was performed very satisfactorily for the first time in London, on February 12. The musical qualities of this charming episode from *Lalla Rookh* have already found a perfectly adequate interpreter in Schumann; and it was perhaps something more than a bold step on the part of a young English composer to attempt the feat over again. The first difficulty of the text arises from the great length of the narrative, which Schumann has overcome, sometimes by substituting for the classical recitative a sort of arioso of continued but not distinctly phrased melody, sometimes by putting the narrative in the mouth of the chorus, as in the battle-piece in the first part; and in this Mr. Barnett has followed him with but moderate success. Mr. Barnett's melodious capacities appear to advantage in the ensembles of the solo voices; but here again the hearer is perpetually reminded of Mendelssohn's part songs. The Oriental colouring again, which Schumann achieves by his rhythm, and instrumentation, and harmony, is entirely absent from the sober and tame orchestration of Mr. Barnett, which is astonishing in one who might look back upon such models as Berlioz and Liszt. Another difficulty of the text is the anticlimax by which the action proceeds from the wild turbulence of contending hosts down to the prayer of a little child. This, Schumann has dealt with by a masterly heightening of the spiritual import of the music in proportion as the action decreases; but here Mr. Barnett has signally failed. He puts the single pieces of verse to single pieces of music without much attention to the general dramatic economy and unity of the effect. Hence he does not prevent his music from flagging with the text: and a sense not altogether alien to relief comes over one when the Peri at last with a melodramatic fortissimo enters the long closed doors of heaven.

Bach's *Passionsmusik* has been again given under the direction of Mr. Barnby. Every performance of this great work is a valuable lesson both to those who play and to those who hear.

The Saturday Concerts at the Crystal Palace maintain their interest, in respect both to the music chosen for performance and the manner in which it is performed. Since the last notice of them in these columns, Haydn's Symphony in B flat, Schubert's Entr'acte music to *Rosamunde*, Schumann's Pianoforte Concerto in A minor, Spohr's Symphony, "The Consecration of Sound," and two movements from a Symphony by a young Englishman, Mr. Henry Gadsby, with other pieces of less scale though hardly of less interest, have been performed. The vocal part of these concerts too, hitherto generally so inferior to the instrumental, has of late been brought much nearer to its proper level. The singers have been Madame Lemmens-Sherrington, Mr. Sims Reeves and Santley, and a débutante, Madame Cora de Wilhorst, who seems likely to prove a valuable addition to our not too crowded list of well prepared concert-room artistes.

Dr. Helm writes in No. 9 of the *Musikalische Wochenblatt* about the Concerto for the Pianoforte in D minor by Johannes Brahms, which had just been performed in Vienna. He calls the Concerto the most original production of the composer (except his *Requiem*), and also the most genial (*geistig grösste*) work of its kind since Beethoven. Brahms himself played the pianoforte part.

Contributions to the Theory of Natural Selection. A Series of Essays, by Alfred Russel Wallace. London: Macmillan and Co., 1870.

[Second Notice.]

The first problem to which Mr. Wallace addresses himself in the last two essays is whether the human race is to be considered as one or as several species. The question is one of those which is usually discussed rather in a dogmatic than a critical spirit, and with more passion than knowledge. Mr. Wallace succeeds in steering clear of these dangers, and in furnishing a line of argument which concedes the point to those who recognise a single origin for mankind, and which will at the same time satisfy those who, on various historical grounds, adduce the physical invariability of the existing races of man, as an argument in favour of the conviction that men were originally constituted in as many varieties or species as we now find them. The argument is shortly this:—The races of men now living, even the most savage, live in a social manner, and have more or fewer sympathetic affections. The weak, deformed, and sick, are not killed, but supported; such services for the general good are assigned them as they are competent to perform, while the strong and healthy undertake the more important duties of the protection and food-supply of the community. Thus, by one member of the community—whether tribe, nation, or race—helping the others instead of destroying them whenever opportunity offers, not only the community, but every member of it, prospers. The endless *struggle* for existence gradually ceases amongst the members of such a community; even the weaker and more imperfect of them succeed in propagating like the rest, and thus the progress towards greater perfection in mere bodily organization is either entirely checked or at least considerably retarded. On the other hand the possession of greater intelligence, by the bodily weaker, may exercise an important influence on the survival of the fittest. The physically stronger is not always distinguished by the keener mind, but frequently obtains the means for the better husbanding of his strength through the inventive capacity of a weaker but cleverer individual; the latter contrives and prepares his weapons, and provides himself also with means of protection against attack. By imitation and instruction the art of more secure aggression and of better defence quickly spreads even among the members of the community of smaller intellectual endowment: the thing learned exercises their intellectual powers, and they transmit these by inheritance to their children. It is in this manner that all progress passes over gradually from the physical to the intellectual; the body remains unchanged in outward form, whilst the mind, and those organs like the brain which are essentially concerned with its activity, alone develop.

This is, as near as may be, Wallace's argument. And if it be urged against him that the physical differences between various races of men at the present time are not inconsiderable, especially in the colour of the skin and the texture and quantity of the hair, our author refers the origin of these differences to the time when the effects of intellectual training had not so exclusively asserted themselves, and physical peculiarities were more easy of acquisition.

With this line of argument those who are disposed to dogmatise on the unity or plurality of the human species may content themselves as best they may.

We now come to the last essay, "On the Limits of Natural Selection as applied to Man." This essay has already given much occasion for criticism and rejoinder; and in a certain sense the greatest interest is concentrated on it, since it touches directly and immediately the highest problems of existence. It is divided into two sections, the first of which adduces certain facts, which, according to the author's view, exclude natural selection as the mode of explanation; while the second attempts to introduce another principle to supply its place. In a more recent reply to an attack by M. Claparède, Mr. Wallace has expressly affirmed that he rests on these facts the whole burden of proving the insufficiency of the explanation afforded by the principle of natural selection. What are these facts?

Mr. Wallace believes he has established that primeval man, at the time of his first appearance, must have possessed characters which were hurtful, or at least useless, to him, and which therefore can never have arisen according to the laws of natural selection, or at all events can never have been transmitted by descent. These characters are expressed as follows:—"The brain of the savage is larger than he needs it to be;" "Man's naked skin could not have been produced by natural selection;" "The feet and hands of man considered as difficulties on the theory of natural selection;" "The origin of some of man's mental faculties, by the preservation of useful variations, not possible." Let us examine some of these a little more closely.

Supported by the opinion "of all the most eminent modern writers" that there exists "an intimate connection" between the small size of the brain of the savage and his diminutive intellectual development, Wallace thinks it necessary to suppose that the brain of the savage has always been found too large for its intellectual functions. The apes, for instance, whose intellectual condition is not so very far behind that of the Hottentots or Papuans, have nevertheless a very much smaller volume of brain; the sudden advance is explicable merely on the supposition that man had from the beginning a large quantity of brain in order to enjoy the later requirements of civilisation. Even if we admit, however, that that proposition of "the eminent modern writers" is anything more than an unproved conjecture, Wallace's view distinctly conflicts with a proposition well known to every physiologist, and employed in a masterly manner by Darwin, on the use and disuse of organs. If the brain of the savage is not used in fact to its full capacity; *i. e.* if essential and considerable portions of it exist really without function, these portions must without doubt, according to all the laws of physiology, degenerate, and gradually disappear. This then must have been the case with the brain of prehistoric man.

Of what substance can we suppose this superfluous brain to consist? Of ganglionic cells? If so, these cannot have been different in character from modern ganglionic cells. They must have received excitations and have combined them in various ways: then have transformed them into excitations in us, as reflex actions, as volitions (how, we are for the present entirely ignorant), or have incorporated them in the form of ideas in the infinitely complex machinery which we call consciousness. Are we then to suppose these superfluous portions to belong to the cerebral connective tissues? Even that would not make them brain: indeed there is no conceivable ground explaining their presence and persistence or indeed for supposing them possible. Whichever way we turn, if we are not to fly in the face of plain physiological fact, we are compelled to regard these mainstays of Wallace's objections as untenable—not to mention the fact that elephants and whales have larger brain volume (and therefore on this theory ought to have superior capacities) than Cuvier or Napoleon.

The second point is more difficult to meet. Not that we are driven to admit that natural selection is insufficient to

account for the hairlessness of the human skin simply because such hairlessness might have been injurious, but because it is almost impossible for us to have any knowledge of the time when the gradual change took place from the hairy state of the ancestors of the present race of men to a hairless condition. But if we understand Mr. Wallace rightly, he lays great stress upon the circumstance that the back has become bare, and that it is this portion of the body which savages protect against rain. Even if it were true that "the naked and sensitive skin, by necessitating clothing and houses, would lead to the more rapid development of man's inventive and constructive faculties," how does it come to pass that that portion of the body which, according to Mr. Wallace's statement, is the best protected, the back, is the very one which, according to the most exact measurements of physiologists, is the least sensitive? And does not rain also fall as much on the breast, the legs, and the arms? Again, how does Mr. Wallace know that the *hairy* ancestors of the men now existing did not possess clothing and houses? Further, why may we not simply suppose that they gradually lost their hair because they did not any longer need it? Why, lastly, may not this be the reason which prevents the Esquimaux from again acquiring a thick coat of their own? We thus get question for question; dilemma for dilemma.

We may pass over any details respecting the hands and the feet, since Mr. Wallace himself says, "he did not attach the same importance to them as to those he had already dwelt on." But as to the human voice, Mr. Wallace will not deny that there are certain sounds of many savage languages which a singer who can render Mozart and Rossini to perfection and with the greatest ease, is nevertheless quite incapable of producing; that thus the accurate cultivation of the throat and windpipe (and the latter is of the greatest importance for the beauty of the voice) is necessary, not merely for those highest requirements of art, but also for the commonest sounds and cries of savages little elevated above the beasts. The supposition of a predisposition therefore, also becomes superfluous.

If we hold that none of the facts hitherto mentioned are sufficiently established to justify so important a step as the introduction of a new principle of explanation, we must equally object to any attempt to adduce reasons from the so-called psychical regions of human nature. Psychology is itself in far too incomplete a state to throw much light on the matter. The question how the motion of material particles can pass over into thought seems to be as far from a solution as it ever was. We must therefore concede to Mr. Wallace, and to those who think with him, the right to account for psychical and organic phenomena on other than mechanical principles, especially as he does not blink the attempt to get rid of these principles even in the explanation of the inorganic world. Criticism has merely to control the method and the cogency of the arguments: not to reject principles of explanation as such. We confess that Mr. Wallace's principles, as they are expounded in the last of his essays, admit of being methodically and consistently carried out: and shall welcome any attempt which he may make in a future edition to perfect them in these particulars. If such principles do not directly help us onwards, they at least preserve us from onesidedness.

Anton Dohrn.

The Theory of Practice. An Ethical Enquiry, in Two Books. By Shadworth H. Hodgson. 2 vols. Longmans, 1870.

This is a remarkable but unsatisfactory book: remarkable because the author shows an unusual interest in and command over metaphysical and logical forms; unsatisfactory because he attempts to compromise where compromise is impossible. In a former work, *Time and Space*, Mr. Hodgson laid down the basis upon which the *Theory of Practice* is constructed, and hence his present conclusions are limited and conditioned by the validity and sufficiency of the positions there assumed. As the writer conceives ethical theory, nay the theory of practice generally, to presuppose metaphysic, we must enquire how far his notion of metaphysic is an adequate one. Now we find that Mr. Hodgson has nothing to offer by way of a metaphysic except a theory of individual consciousness. This consciousness does not even originally include a knowledge of self, which is gained by later experience, and throughout is merely of phenomena. Each phenomenon has two elements—a formal, which is time and space; a material, which is feeling. Accordingly, all through his investigations, Mr. Hodgson has no eyes for anything except time, space, and emotions. The possibility of an ontology is expressly denied by him.

Now of course it is open to a writer to give any signification he likes to the ill-coined and ill-used word metaphysic: but if we use the word in its ordinary acceptation, as the representative in modern parlance of the ancient πρώτη φιλοσοφία, a metaphysic without an ontology is a contradiction in terms. Realism may be an impossible scheme, but an ontology in some form—idealistic or otherwise—we must have. To what branch of philosophy would Mr. Shadworth Hodgson hand over speculations as to the nature of the first cause, of God? or would he be inclined to surrender such investigations entirely to mystic theology, as we gather from his contemptuous mention of "natural religion"? (vol. i. p. 546). If so, Mr. Hodgson's system is entirely *en l'air*. It no more attains to an ἀρχη ἀνυπόθετος than Positivism itself. Its theory ultimately depends upon a consciousness of everything in general, and nothing in particular; its practice upon casual emotion. It is not in the words of its author a "metaphysical positivism," but merely a pseudo-metaphysical positivism—a positivism urged beyond the bounds of its narrow consistency into a dream-land where there is neither goal to aim at, nor fixed resting-place, nor chart of guidance.

As we might expect from the general nature of his theory, when the writer comes into the region of practice, we hear of nothing but emotions. Conscience is an emotion, justice is an emotion, and credit is actually taken for the presentation of a *definite* end for morality, in the fulfilment of the emotion of justice by the emotion of love. The criterion by which we are to regulate our action towards this end is the emotion of conscience or moral sense, and the distinctness and immediacy of this criterion is contrasted with the vaguenes of the Aristotelian maxim for conduct, ὥς ὁ ἀγαθὸς ὁρίσειε (*sic*). It is needless to remark that Aristotle's words (*Eth. Nic.* ii. 6, 15) are ὡς ἂν ὁ φρόνιμος ὁρίσειεν, and that φρόνησις—the meeting-point of the reason and the will—is Aristotle's subjective criterion of morality, a fact apparently missed by Mr. Hodgson (vol. i. p. 22). We think that to most readers, as to ourselves, "practical wisdom" will seem a better guide to and standard of action than the "emotion of moral sense."

As he has now provided us with an end and criterion, Mr. Hodgson next turns to the consideration of the "motive" of action. This is an unfortunate word to admit into a philosophical system, owing to the vagueness of its use in ordinary language, so we will see how the writer defines it. Accordingly we find it stated (vol. ii. p. 16) "that the motive is the efficient or dynamical cause, tending to the production or modification of the ultimate ideal end." Here it seems that motive is used in its mechanical sense as the efficient cause, but elsewhere we find pleasure to be the

motive; surely pleasure cannot be called the *efficient* cause of action. The fact is, neither in his use of the word "end" nor in his use of the word "motive" is Mr. Hodgson consistent, and, moreover, he never analyzes the contents of his end—the sense of moral right.

It will be evident from what we have said that we cannot accept the system set forth in the *Theory of Practice* as an adequate solution of the ethical problem, or even as a well-directed attempt towards the solution of that problem. Still the work before us is not without great merits, and the necessities of destructive criticism ought not to blind us to these. When filling up his framework by the delineation of the special emotions, Mr. Hodgson is always acute, and sometimes profound. Particularly interesting is his description of the emotion which he designates "eeriness" (vol. i. p. 160). Again, there are many passages which are almost models of neat, crisp, and terse philosophical statement, especially on the relation of logic to science (vol. ii. pp. 5, 6).

But to sum up our opinion of the merits of the book as a whole, we cannot but think that Mr. Hodgson has shown himself in it rather a fit student than a fit exponent of philosophy.

Scientific Notes.

THE PARIS BALLOONS.

FORTY-FOUR authenticated balloon voyages from Paris took the directions given beneath :—

	N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
In September	..	..	..	..	..	..	2	..
„ October	6	3	2	..	..	..	..	..
„ November	2	4	2	..	1	5	1	..
„ December	..	2	2	2	2	2	2	..
„ January	1	2	1	..	..	..	..	..

The whole of the October balloons seem to have moved with the south and westerly winds which prevail over Paris for 17 days in that month (the average given by 30 years' observation).

In November the same winds blow over Paris for an average of 18 days, but in this month only half of the recorded number of balloons took the direction of these winds; five moved in a completely opposite direction to south-westward. But north-east winds prevail for only two days in this month, so that either there has been an unusual amount of north-easterly wind during last November or these balloons were caught into the upper returning polar current, which may have descended lower in that month.

In December the south-west winds have still an average of 17 days, but an equal number of balloons took each direction between N.E. (round by south) to W.

From the few recorded observations of the elevation of flight the balloons appear to have risen and travelled at from 2000 to 7000 feet above the ground; their speed varied from 13 to as much as 80 miles an hour. The furthest flights were those to Norway, 840 miles at the rate of 55 miles an hour, and to the range of St. Baume, between Marseille and Brignolles, 420 miles at 28 miles an hour. This latter balloon was evidently caught by the cold current of air which falls on the Gulf of Lyons as the chilly "Mistral."

By means of the balloons besieged Paris was able to send messengers to the outer world on an average once in every two days, and the whole space within which they alighted was not less than France itself. Whether any of the attempts to convey intelligence by their means into the city were successful remains to be told.

There is no certain information of any loss of life during these months of air-navigation, and the risk attending this mode of transit is certainly not greater than that of the early days of sea-voyaging.

Botany.

Parasitic Ear-Fungi.—The *Bulletin de la Société impériale des Naturalistes de Moscou*, No. 1, for 1870 (just published), contains a paper, by Dr. Karsten, on the parasitic fungi found in the human ear, with copious illustrations. The writer confirms the statements made by Hallier and other previous observers, that when the spores of these fungi are sown elsewhere, they assume very different forms, according as the matrix on which they are sown is rich or poor in material for nutrition; and that fungi described by earlier writers as distinct species, or even as belonging to different genera, are frequently merely different forms in the genetic cycle of the same plant.

Fertilisation of Fumariaceæ.—Professor Hildebrand, of Bonn, has been continuing his important researches on the mode of fertilisation of different tribes of plants; and contributes to *Pringsheim's Jahrbuch für wissenschaftliche Botanik* for 1870 some observations on the phenomena observed in different plants belonging to the order Fumariaceæ. He finds that, except in *Hypecoum* (where the stamens are free instead of diadelphous), the pollen from the ripe anthers falls immediately on to the stigma, with which they are in close proximity; so that self-pollenizing (*Selbstbestäubung*) is inevitable, the anthers and stigma being developed at precisely the same time. This does not, however, necessarily imply self-fertilisation, as insects visiting the flowers carry off some of the pollen to other individuals. *Hypecoum* is somewhat protandrous (stamens ripening before stigma).

Bud Varieties.—Mr. Thomas Meehan read a paper before the Philadelphia Academy of Natural Sciences, on November 29, 1870, having for its object to show that varieties in plants often originate from buds, and not almost exclusively, as is generally supposed, from seeds. The instance adduced by Mr. Meehan in illustration is a new form of *Rubus*, a genus which he believes is scarcely ever produced from seed in the wild state. He also brought forward evidence of bud variation, in which there was no possibility of hybridism, in the case of the sweet potato (*Convolvulus batatas*), which never flowers in that part of the country, precluding the possibility of seminal power having had any influence on the phenomenon. The points which he specially insists upon are:—1. That identical varieties sometimes appear in localities unfavourable to the idea of a common centre of origin. 2. Varieties have originated in which probably no hybridism or any seminal agency operated. 3. Varieties have certainly originated in the sweet potato by evolution, without seminal agency; and the same variety has, in this way, appeared in widely separated districts. 4. As the discoveries of Darwin have shown varieties to be, in many cases, the parents of species, species may originate in widely separated localities by bud variation.

The countries of Southern Europe have suffered so severely from the improvident destruction of forests, the climate has so materially deteriorated from the baneful effects thereof, that any effort to supply a remedy, and to recover lost ground, must be hailed with unmixed satisfaction and approval. The publication of the *Estudios Forestales*, by D. H. Ruiz Amado (Tarragona), is a welcome sign that the Spaniards are alive to the vital importance of forest conservancy, and that the subject is likely to receive due attention in a country which has suffered as much as, if not more than, any other in Europe, from reckless felling of timber. The once forest-covered hills which bordered the rich garden of Murcia in Moorish times are now a mass of arid rocks.

Physics.

Is Electricity produced by the Living Human Body?—In the *Spiritualist* of February 15, a periodical in which one would hardly expect to find original scientific matter, are some valuable remarks by Mr. Cromwell F. Varley, the well-known electrician, on the supposed production of electricity by the living human body. He first remarks that the sparks produced, in certain cases, by combing the hair, by drawing off silk stockings, or by rubbing the feet on a carpet, are illustrations of frictional electricity, which in no way depend on vitality, but are due solely to proper conditions in the substances rubbed together and in the atmosphere. He then comments on another form of supposed bodily electrification, which has led many people to suppose that the brain was an electrical battery sending electricity through the nerves to contract the muscles, and which is produced as follows. The two terminals of a very sensitive galvanometer are connected each with a separate basin of water. If the hands be then placed one in each basin, on squeezing one hand violently a positive current is almost always found to flow from that hand, through the galvanometer, to the other hand which is not compressed. While experimenting night after night on this subject in 1854, Mr. Varley found that, after squeezing the hand, opening the clenched fist produced a momentary increase of power instead of a decrease; and when the wind was from the south-west, the power was less than one-fourth as strong as when it was from the north-east. The former wind was found to be slightly negative to the earth; the latter was invariably powerfully electro-positive. On trying to exhibit these currents on one occasion and finding them to be very

weak, Mr. Varley washed his hands thoroughly in water containing a little liquid ammonia, in order to decompose the grease in the pores of the skin. The result was a diminution instead of an increase of the power. On washing his hands, however, with very weak nitric acid, and afterwards with water, he obtained more power on squeezing his hands than he had ever done during the most persistent east wind. This led to an explanation of the phenomenon as one due to chemical action alone, the act of squeezing the hand violently forcing some perspiration out of the pores. By dipping one hand in a solution of ammonia and the other in one of nitric acid, and then washing both in water, squeezing either hand produced a current in the *same* direction; and when both hands were placed in the water and a little acid dropped on one of them, a current was instantly generated without any muscular exertion. Mr. Varley finds no evidence that electricity exists in or about the human body, either as a source of motive power or otherwise; and would explain all the feeble electricity which has been obtained from the muscles as due to different chemical conditions of the parts of the muscle itself. The nerves are bad conductors, and are not insulated. The force which is transmitted by them cannot therefore be electricity; and the fact that this force is transmitted at a rate about 200,000 times slower than an electric current, is additional proof of their non-identity. It is to be hoped that a detailed account of Mr. Varley's experiments on this interesting subject will soon be given to the scientific world.

On some Phenomena observed with the Water-hammer.—*Poggendorff's Annalen* for December contains the following communication from Professor Lommel:—By means of tinfoil coatings applied to the two ends of a water-hammer, he connects the latter with the conductors of a Holtz's electric machine; on working the machine, at every discharge, a sort of sheet lightning is seen to flash through the vacuous space above the water in the tube; the light was of a magnificent purple red colour, and, when viewed with the spectroscope, gave the three hydrogen and the sodium line. The discharge caused, however, the decomposition both of the water and of the glass, for, after a time, the vacuum in the tube was found to be destroyed, and the water to have an alkaline reaction. In tubes filled with a mixture of alcohol and water the discharge was of a light green colour, and its spectrum exhibited two red, one yellow green, one very light green, a blue, and a violet line, and is remarkably similar to that yielded by the green portion of the flame of a Bunsen's burner. Here also gas, probably a hydrocarbon, was liberated by the discharge, but the liquid was found to have a decided acid reaction, and also to contain traces of peroxyde of hydrogen. The spectrum observed in the second case presents many points of resemblance to that of lightning as observed by Kundt. The tube of a thermometer connected by means of tinfoil coatings with an induction coil or electric machine, is seen to be filled with the green light of mercury vapour when the discharge is allowed to take place if it is absolutely vacuous, but if it still contains a trace of air the light is of a reddish colour, and this is accordingly a most delicate method of testing a thermometer.

Chemistry.

The Stewart County Meteorite.—This aërolite fell at 11.30 A.M., on the 6th October, 1869, about 12 miles south of west from Lumpkin, in Stewart County, Georgia. An account of its descent is given by Prof. J. E. Willet, of Mercer University (*American Journal of Science*, November, 1870, 335). The sky was clear at the time when a series of explosions, together with a rushing sound, were heard over a region about 30 miles N.E. and S.W. and 50 or 60 miles N.W. and S.E. The stone struck the ground in sight of two negroes, and some twenty steps from them, at an angle of about 30 degrees with the horizon, and penetrated about ten inches into the soil. It weighed nearly 13 ounces, and was covered with a black crust. Prof. J. Lawrence Smith has contributed to the same number of the journal the results of his examination of the stone. The fractured surface exhibits numerous greenish globules set in a whitish granular material, and throughout its mass particles of nickeliferous iron, some pyrites, and a few specks of chrome iron were visible. The green nodules were found to be bronzite, though the presence of 8 per cent. of alumina in them is an unusual feature. The nickeliferous iron contained 12 per cent. of nickel and 0·75 per cent. of cobalt. With the exception of the bronzite, the minerals constituting the earthy portion of the meteorite could not be separated for examination, and their presence is assumed from the results of an analysis of the mass, which indicated the following composition:—

Nickeliferous iron	7·00
Magnetic pyrites	6·10
Bronzite, or hornblende, Olivine, Albite, or oligoclase, Chrome iron	86·90
	100·00

Amorphous Sulphur.—Weber finds (*Poggendorff's Annalen*, No. 11, 1870, 432) the soft amorphous sulphur, set free on passing a current of sulphuretted hydrogen through fuming nitric acid, better adapted for the investigation of the physical characters of this element than the so-called γ sulphur. When collected and dried, it is ropy and elastic like caoutchouc, and remains so for many days. After treatment with carbon disulphide 74 per cent. remained undissolved. Placed in a steam-bath, it became quite liquid, but afterwards solidified; whilst a thermometer immersed in the sulphur showed a temperature 9° above that of the bath during the change, and then fell. During some chemical changes, as is known, soluble sulphur is liberated. That set free by the spontaneous decomposition of hydrogen persulphide and the variety known as milk of sulphur are in the soluble modification. Potassium monosulphide, when decomposed by hydrogen nitrite, liberates insoluble sulphur; if, however, the potassium compound be converted by digestion with sulphur into polysulphide, the latter body, on treatment with hydrogen chloride, gives up its sulphur in the soluble modification. The author concludes that from compounds in which the constituents are held together by comparatively strong chemical affinity, such as hydrogen sulphide and alkaline monosulphides, sulphur separates in the amorphous condition; from compounds of less stable constitution, however, like persulphides, we obtain it in the other form.

A New Class of Alcohols.—In the oxydation series of the hydrocarbons, there fails that member which can be regarded at one and the same time as alcohol and as aldehyde or acetone. Graebe (*Berichte der deutschen chem. Gesellschaft zu Berlin*, No. 1, 1871, 34) was led to search for a body of this kind, with the hope of ascertaining whether substances containing the atomic group $COCH_2(OH)$ class themselves more with the alcohols or the acids. Their study was, moreover, of importance, in tending to throw light on the constitution of the sugar group, since the acetyl compounds formed by Schützenberger indicate that grape sugar contains one carbonyl group, and cane sugar two. From acetylbenzol (acetophenone), $C_6H_5COCH_3$, Graebe has succeeded in producing the desired acetylbenzol alcohol, $C_6H_5COCH_2(OH)$. By passing chlorine at the boiling temperature through acetylbenzol, and subsequent fractional distillation, chlormethylbenzol, $C_6H_5COCH_2Cl$, is formed. It readily parts with its chlorine in the presence of oxidizing agents, and is converted into benzoic acid. In the facility with which chloracetylbenzol gives up its atom of chlorine, it resembles chloride of benzyl rather than the chloride of benzoic acid. In boiling water it undergoes no change; if, however, these two substances be heated together to a higher temperature in closed tubes, hydrogen chloride and a solid body with a very high boiling point are formed. Boiled for some time with an alcoholic solution of potassium acetate, the acetic ether is produced. Sodium carbonate or lead oxide and water also remove the chlorine, and among other products the new alcohol is found. The acetic ether melts at 44°, boils at 270°, and separates from ordinary alcohol in rhombic plates. The alcohol is easily prepared from the acetate by the action of alcoholic potash.

On the Occurrence of Amorphous Mercury Sulphide in Nature.—This mineral is found in considerable quantity in the Bedington Quicksilver Mine, Lake County, California, and is described by Dr. Gideon Moore, in the *Journal für praktische Chemie*, No. 17, 1870. It is found in association with iron and copper pyrites and crystals of cinnabar. It is without structure or cleavage, and has a brilliant fracture; when pounded it takes a high polish and metallic lustre resembling graphite. Its streak on porcelain is pure black. Its hardness is about 3 of Moh's scale, and consequently somewhat greater than that of cinnabar. Its specific gravity is 7·70 to 7·74, being greater than that of artificially prepared black mercury sulphide, which is 7·55, and less than that of cinnabar, which is 8·0 to 8·2. Analysis showed it to differ in no way as regards chemical composition from cinnabar. The author proposes the name metacinnabar for the new mineral. The region where it occurs bears the most striking evidences of volcanic activity.

Dr. Wilhelm Kühne, Professor of Physiology at Amsterdam, author of the *Lehrbuch der physiologischen Chemie*, has been called by the University of Heidelberg to the chair of physiology, rendered vacant by Professor Helmholtz's translation to the University of Berlin.

History.

Select Charters and other Illustrations of English Constitutional History, from the Earliest Times to the Reign of Edward I. Arranged and edited by William Stubbs, M.A., Regius Professor of Modern History. Oxford: at the Clarendon Press, 1870. (Clarendon Press Series.)

THE learned editor of the principal chronicles of the reigns of Henry II., Richard I., and John, in new and excellent texts, has supplied another want by a selection of constitutional documents. As a knowledge of the growth of the English constitution, its causes and consequences in a continuous development, is beginning to form a part of a regular English education, the Origines of English constitutional history, in the handy shape of a manual, are presented both to teachers and scholars alike. The collection is justly not continued further than the reign of Edward I., because after the era of this great law-giver "politics begin to replace polity." Similar documents of other nations, though highly valuable with regard to a comparative constitutional history of Europe, have not been admitted, lest the book might become too bulky.

A sketch so concise as only a master-hand is able to pen it serves as a running commentary to the documents arranged in chronological order. It opens with the ancient German polity as introduced by the Low-German tribes, but developed distinctly during their migration into and conquest of an island. There is the township, the hundred (*pagus*), the shire (*civitas*), and the kingdom of the old English period, growing slowly into a union after the introduction of Christianity, the organisms of Church and State henceforth advancing side by side. But the king and the witenagemot, since the end of the 10th century, suffer both from the first appearance of feudal centralisation in the hands of a few great earls. William the Conqueror, in his single person national sovereign and supreme landowner, introduces his own feudal system, in which Norman vassalage and the nation with its ancient institutions co-exist, but held together by an administrative machinery, represented by the Justiciar, the Curia Regis, and the Exchequer. The system is preserved during another generation, in spite of the tyranny of William Rufus, chiefly by the able statesmanship of Henry I., but breaks down in Stephen's reign, when "each baron was king in his own castle." With Henry of Anjou begins the rule of law, the barons and the clergy, like all other men, having equally to submit to it. The national council and judicial courts, the offshoots of the Curia Regis, still traceable in the Privy Council of the present day, as well as the first trial by jury, owe their origin to this important reign, to which that of Richard I., in the matter of constitutional development, is a mere supplement. Afterwards, John, the tyrant, without restraint, has to be forced to observe the same rule towards all free men by the Great Charter, which, both in its political and constitutional bearing, resembles in substance a treaty of peace. In the politics of the 13th century the national and the feudal parties alternately combine and separate again more than once, till the perfidy of Henry III. is overmatched by the strength, wisdom, and sincerity of Simon de Montfort. But the organization of the great reformer is proved to be premature by his own catastrophe, and the long constitutional struggle is only terminated by the eminent statesmanship of Edward I. By this time the chief component parts of the State machinery are completed in national and county representation, in the growth and the representation of boroughs, in the great councils, in counsel and consent, in taxation.

A few extracts from Cæsar and from the *Germania* of Tacitus, arranged in part ii., contain nearly everything which in the early Germanic polity touches on matters of law and government. They are far from being complete, nor are the numerous notices admitted which, occurring in the *Annals*, the *Histories*, and the *Agricola*, have long ago been carefully collected by Jacob Grimm, as an appendix to his edition of the *Germania* (1835). The extracts from the Anglo-Saxon laws, chiefly from Thorpe's translation, are likewise very comprehensive; but the most important passages concerning public assemblies, courts of law, people's rank, territorial division, taxation, and the principles of old English self-government in the hundred, the shire, and the borough, will be found grouped together.

With part iii., the Norman period, commences the consistent arrangement of this excellent book. To each reign is prefixed a list of the Archbishops of Canterbury, of the Chief Justices and the Chancellors, and a lucid sketch of its constitutional history. Extracts from the chronicles are regularly succeeded by statutes, charters, writs, and other legislative documents. The financial government of towns and counties in the days of the Conqueror is naturally explained from Domesday. The memory of Henry I., who adhered to his father's routine, and led the way for the great reforms of his grandson, lives chiefly in the sole legislative act of his reign known to us, the charter of liberties issued at his coronation.

Part iv. is devoted to Henry II., "who governed England as an English king by asserting his royal rights and those of his people." Here we have the Constitutions of Clarendon from MS. Cotton. Claudius, B. 2, and the Assize of Clarendon from MS. Bodl. Rawlinson, C. 641, both of which MSS. Stubbs, in his edition of Hoveden, has pointed out as the safest texts. The Assize of Northampton, an expansion of that of Clarendon, is almost a forerunner of the Great Charter of John. The Assize of Arms shows the revival of the ancient *fyrd* or national militia, the Saladin Tithe of 1188 is the first attempt to tax personal property by employing local jurors to determine the liability of individuals. The extracts from Glanvill's law-book refer to the system of recognition by jury in connection with the principles of representation and election. Every scholar—and not merely from an antiquarian point of view—will be pleased to find the *Dialogus de Scaccario*, the work of Bishop Richard Nigel of London, undoubtedly the greatest in a succession of great administrators, copied in extenso from Madox's invaluable *History of the Exchequer*.

Part v. comprises the reigns of Richard and John. Of the four justiciars who acted in Richard's absence as his substitutes and almost as independent sovereigns, Hubert and Geoffrey distinguished themselves by their administrative skill in advancing the progress of the country towards self-government. The charters granted by Richard to the towns involve a remarkable step in the consolidation and the growth of the corporation. John's misgovernment, on the other hand, his concession of the kingdom to the Pope, brought the interest of the people into the closest harmony with that of the baronage. The celebrated Articles of the Barons of the 15th June, 1215, and their fruit—the Great Charter on which "the whole of the Constitutional History of England is a commentary"—would have been impossible without the rapid decay of feudalism. The new order of things is ushered in by a number of very significant public acts. There is a writ proceeding from a Commune Consilium dated 1205, according to which the ancient *fyrd* and the feudal levy begin to be consolidated into a general army of the nation. An order for enquiring into evil customs, a few days later than Magna Charta, throws considerable light on the method of election in the county court. Amongst

other cities and boroughs London obtains a charter of privileges and the special right to elect its mayor annually.

Part vi. treats of Henry III., opening with an admirable introduction on the brilliant, fertile, but precocious character of the 13th century in general, as well as on the struggles and shortcomings of this reign in particular. The Great Charter, as is well known, was re-issued by this king three times, but under influences very different from those to which John had to submit, and with the most significant omissions and additions. Each time they are most carefully noted and explained by collation with the original draft. Nevertheless, in spite of the king's perversity and further reaction in a feudal direction, a number of documents exist, showing the strong under-current towards a final settlement in constitutional affairs. By a writ for the collection of a carucage, taken from the Close Rolls of 1220, two knights of the shire are summoned, and the representation based on election has to assist in financial matters. In 1226, again, four knights of the shire are to take part even in political deliberation. In 1254 two knights are to be sent by each county for the granting of a national aid, no distinction being made between tenants-in-chief or knights, as such. According to a most interesting document of 1231, illustrating the composition of the county court, its original elements since the days of Henry I. and Henry II., have been reinforced by representatives of the ancient townships and the new municipalities, a combination of all the shires being the only step wanting now for a true representative parliament. We miss, however, in Mr. Stubbs's highly instructive selection a certain royal writ, in which the word parliament seems to have been used officially for the first time in a general sense and with a most remarkable reference, viz. Close Rolls, 28 Henry III. membr. 13 (1244), *Parliamentum Runimede* quod fuit inter Dom. Johannem Regem patrem nostrum et barones suos Angliæ. The documents relating to the celebrated provisions of Oxford—the movement of 1258—which aimed at an elective council, but undoubtedly would have superseded the king entirely, had it succeeded, are very conveniently grouped together; the famous Early English Proclamation of the 18th October being printed from the revised text of Mr. A. J. Ellis, the French articles never without a translation. Another set contains all documents connected with the administration of Simon de Montfort, in which the great struggle seemed for a moment to arrive at its ultimate conclusion. Mr. Stubbs adheres with due regard to the conservative view of the framers of the *Report on the Dignity of a Peer*. According to it, the parliament summoned for the 20th January, 1265, is not to be considered as the origin of popular representation, the novelty consisting rather in the participation of the representatives of the towns for the purpose of the national council. It had long been usual for local self-government, where the representation of the shires was decidedly more popular than that of the boroughs. The reasons are well known why the national council, though rapidly tending that way, did not merge into a complete concentration of the local machinery as yet for another generation.

This came to pass at length in the grand reign of Edward I., the constitutional evidences of which are most ably arranged and reviewed in part vii. In an age of lawyers, to whose captiousness the principal errors of the great king himself must be mainly attributed, every branch of the administration of England takes definite form. By active legislation in Church and State all the principles that were in motion since Henry II.'s time were at last consolidated, so that the later struggles do not concern so much the framework of the constitution as its management. Perfectly independent forces, however, are still at work. To ordain in council without referring to parliament remains the privilege of the crown by the First Statute of Westminster. In the Second, summing up the former Assizes of Arms and Watch and Ward, the persistence of primitive institutions and the victory of state policy over feudalism are exhibited. Whereas in the Writs for parliaments in 1290 the presence of the representatives of the shire is not yet regarded as necessary, those of 1294 mark the final transition from the system of local to that of central assent, until by the great council and parliament of 1295 a perfect representation of the three estates is actually secured. The great crisis of 1297, turning on the bull *Clericis laicos* and the refusal of the Earls to go to Gascony, terminates in the confirmation of the Charters, in which the constitutional articles of John's Magna Charta, which had been expunged in the re-issue of 1216, because they would have proved for ever an obstacle to a firm central power, are now omitted for a better reason. No link in the chain will be missed, and each public act receives its due consideration in connection with the constitutional development as a whole. After the Statute *de tallagio non concedendo*, which is only preserved by Hemingburgh and not in any authoritative record, and by which the king never regarded himself bound, after the Summons to the parliament of Lincoln and the Writ for the collection of talliage, the chapter is wound up by an old favourite of antiquarians, the *Modus tenendi parliamentum*. In spite of its preamble nobody will date it in the days of the Conqueror, since Sir Thomas Duffus Hardy, from whose text it is reprinted here, has assigned the oldest manuscript to the time of Richard II. Mr. Stubbs is, however, inclined to accept it as a fairly credible account of the state of parliament under Edward II.

In the appendix the Petition of Right (1628) and the Bill of Rights (1689), the means of reference from a much later period of constitutional expansion, are offered to the political enquirer. A glossary of archaic legal and other terms in medieval Latin, or derived from Anglo-Saxon and old French, will stand any test applied to the multifarious and otherwise not easily accessible subjects of the collection. Here is a book of instruction, a synoptical introduction not only to the statutes at large, but the backbone of all study of national history, and a better specimen of such a work can hardly be furnished. R. Pauli.

Historic and Municipal Documents of Ireland, A.D. 1172-1320; from the Archives of the City of Dublin, &c. Edited by J. T. Gilbert, F.S.A., &c., Secretary of the Public Record Office of Ireland. London: Longmans, Green, & Co., 1870.

The contents of this volume, which is one of the Rolls Series of national publications, are of a very varied nature, and throw considerable light on the condition of Ireland during the space of a century and a half after the Anglo-Norman invasion—a period but little noticed by ordinary writers on the history of that country. Although relating chiefly to the affairs of Dublin, Drogheda, and the principal towns of North Leinster, the documents present a comprehensive picture of the policy which governed the early English monarchs in their dealings with the native and foreign inhabitants of those portions of Ireland which acknowledged their sway. That this policy was of a selfish nature, it is hardly necessary to assert. Even the inhabitants of their "good city of Dublin" had to purchase, with hard cash, the privileges conceded to them from time to time.

The regulations on the subject of traffic and merchandise, tolls and customs, are of great interest in connection with

the history of trade in Ireland during the Middle Ages, a subject of which very little was hitherto known. Of more importance, however, are the inquisitions respecting the enormous secular power of the Dublin archbishops, which Mr. Gilbert correctly observes (xxix) are, "as a series, unique in their age and class in Ireland." For the preservation of these inquisitions we are indebted to John Alan, Archbishop of Dublin, who was slain in the outbreak of "Silken Thomas," in 1534, and whose invaluable collections of Irish historical documents, industriously made in the short space of six years, remain still in manuscript.

The genealogist will find much to interest him in the rolls of names, which occupy 70 pages of the work, and contain some 2500 names of persons, the descendants of many of whom are still recognisable.

Almost one-half of the articles comprised in the work are taken from the Memorandum Rolls of Ireland, a most important class of documents still unpublished. The student of Irish history owes thanks to Mr. Gilbert for making him thus far acquainted with them.

The text is printed with great care and accuracy; but a good glossary, and a translation of the Norman-French portions, would enhance the value of the work.

W. M. HENNESSY.

Intelligence.

The *Annals of Lough-Key*, edited by Mr. W. M. Hennessy for the Rolls Series of ancient chronicles, will be issued in a short time. The contents of this chronicle are of great importance to the history of Ireland from the year 1014 to 1580. It contains also several interesting entries of events in English and foreign history, not noticed in any other authority.

Selected Articles.

F. Ferrara continues his account of "The Ancient Banks of Venice" into the 16th century. We have now some lists of the partners in the chief of them, and also of the creditors in cases of bankruptcy. The State-control over them and the strict enquiry into the causes of failure are characteristic. No new bank could be founded without full securities (fidejussores), *e.g.* the bank "Vittorio Correr" has fifty, bound in two thousand ducats a-piece. The banks had very little capital of their own, but traded on their deposits, and hence so many ruinous failures in those times. Ferrara gives full particulars of the mode of legal proceedings as to them, and a description of the archives where the documents now exist. He shows that Lattes, our previous authority on the subject, has supposed much more commercial liberty to have existed at Venice than was really the case. A freer age can hardly understand the existence of restrictions which long experience has shown to be useless. (*Nuova Anthologia.*)

Gött. Gel. Anz.—Jan. 11. [Böcking's edition of Ulrich Hutten's works ends naturally with the famous *Epistolae obscurorum virorum*. In his review of it, Geiger tries to determine the authorship of these famous letters more accurately than has been hitherto attempted.]—Feb. 1. [Waitz answers Lorenz' defence of the Chronicum thuringicum as being an original work. On the contrary, it is an extract from previous chronicles.]

Philology.

The Sikandar-námah-i Baḥrí of Nizámí, edited by Dr. A. Sprenger and Ághá Aḥmad 'Alí. (*Bibliotheca Indica.*) Calcutta, 1869.

THE Asiatic Society of Calcutta have just published in their *Bibliotheca Indica* the second and concluding fasciculus of the *Khirad-Nâmah-i Iskandarí* of Nizámí. Dr. Sprenger published the first fasciculus in 1852, but, as he soon afterwards left India, the work has remained unfinished till now, when it has been completed by Ághá Aḥmad 'Alí.

Nizámí is one of the most famous Persian poets; he died A.H. 606 (A.D. 1209). His *Khamsah*, or πεμπάς of romantic poems, has been lithographed in Bombay, and one of them, the *Sikandar-námah*,* has been several times printed in Calcutta; but in all these editions the *Sikandar-námah* has only its first part (the "Iḳbál-námah," or "Sikandar-námah-i Barrí"), and the second part has never been printed before. As MS. copies of it are rare, its publication is a boon to all interested in Persian literature. All Nizámí's works are thus now rendered accessible by the press, with the exception of his *Díwán*, which is very rare even in Persia.

The two parts of the *Sikandar-námah* (the first written A.H. 597, the second 599) contain the Oriental traditions of the history of Alexander. They appear to be more or less founded on the well-known narrative of the Pseudo-Callisthenes, which furnished the groundwork for so many popular romances in Europe during the Middle Ages; and the Eastern and Western versions alike supply an instructive lesson how little tradition can be relied on, apart from contemporary written history. The real achievements of the Macedonian conqueror are lost in a cloud of fables, just as in Archbishop Turpin's pretended chronicle all the historical glories of Charlemagne's reign are ignored in the anachronism of his fictitious crusade against the Moors.

These legends appear in their oldest Oriental form in the *Sháhnámah* of Firdausí, who died A.D. 1020, but Nizámí is the next oldest authority (cf. Spiegel's *Die Alexandersage bei den Orientalen*). In the first part of the *Sikandar-námah* we have Sikandar's birth; but he is not represented, as in Firdausí, as the son of the daughter of Fílḳús (Philip), who had been given in marriage to the victorious Dárá, and then repudiated by him; but he is found by the Greek king, while on a hunting excursion, lying as an infant beside his dead mother. Fílḳús adopts the outcast child as his heir, just as in the Pseudo-Callisthenes Philip adopts Alexander, who is really the son of the Egyptian King Nektenabo.

Nizámí narrates Sikandar's various conquests after his accession to the throne; he first goes to Egypt and conquers the Æthiopians, then he seizes Persia from Dárá, and conquers two Hindu kings, Fúr and Kaid. He then passes on to Tibet and China, but is recalled by an invasion of the Russians, who had attacked Barda' in Azarbaiján. (This episode has been edited and amply illustrated by Erdmann in his dissertation *De Expeditione Russorum Berdaam versus*, Casan, 1826, 1828.) After repelling the invaders, he goes on a vain search for the fountain of life in the land of darkness. The first part of Nizámí's *Sikandar-námah*, called "Barrí," or "Alexandreis terrestris," ends with his return to Rúm.

* Another, the *Makhzan ul Asrár*, was edited by Mr. Bland, for the Oriental Text Society, in 1844.

The second part—called "Baḥrí," or "Alexandreis maritima," and also the "Khirad-námah," or "Wisdom-book"—is chiefly occupied with Sikandar's government in his kingdom, his intercourse with the Greek philosophers, and his career as a prophet; but there are several episodes in it of considerable literary interest. The poet begins with a description of the king in his court, administering the affairs of state, and studying all kinds of wisdom with his teachers, and he then gives a chapter to the different explanations of the appellation "Zú'l ḳarnain," or "two-horned," by which Sikandar is known in the East from a passage in the Ḳurán, ch. xviii. The explanations are curious, and one of them is worth notice as an Eastern version of the story of Midas, which, by the way, is also found in the *Ssidikür*, or Mongolian recension of the Sanskrit *Vetálapanchavinçati;* it does not, however, occur in the Hindu original. According to this explanation, the king had two long ears, which he carefully concealed under his crown, and of all his subjects only his barber was aware of it. His old barber at length died, and the king threatens death to his successor in office if he should betray the secret. At last the poor man, unable to repress himself, went into a desert and whispers the secret to the reeds in a pit. A shepherd cuts a pipe from the reeds, and it utters the words, "King Sikandar has two long ears." The king hears it while riding one day through the desert, and on his return forces the barber to confess what he had done.

In the next chapter, pp. 28-30, we have a story that bears a curious likeness to Boccaccio's fourth Novella of the tenth day, which has been lately naturalised in English by Tennyson's *Golden Supper*. Some episodes of inferior interest follow, and we then come to the account of the seven philosophers who are the king's chief advisers in his court. With the usual Oriental disdain of place and time, their names are given as Aristo, Sukrát, Faláṭún, Válís (Thales), Balínús (Apollonius of Tyana), Furfúriyús (Porphyry), and Hurmus (Hermes Trismegistus); and, amidst the vague commonplaces generally put into their mouths, we occasionally find a few traits which are historically correct. Thus Válís, in his discourse on creation, p. 77, maintains that water is the origin of all things; and some of Aristotle's sayings on the same subject dimly remind the reader of the *De Cœlo*. Socrates is unaccountably confused with Diogenes, and there is an interview described between him and the king, who finds him lying outside his hermit-cell and basking in the sun. The most curious episode, however, is one which relates to a contention between Aristotle and Plato. Aristotle claims the pre-eminent seat in the assembly of the sages, and Plato in disgust retires into solitude to listen to the music of the seven spheres. He there invents a musical instrument with seven strings and a gourd, something like the Hindu *víṇá*, which he calls an *arghanún* (cf. ὄργανον, as used in Sept. Ps. cl. 4); with this he plays and, like Orpheus, enchants the wild beasts of the desert, who at one tune fall insensible round him, and at another fly away in panic. Aristotle goes to see the reported wonder, but himself succumbs to the magic influence of the notes, and acknowledges Plato's superiority. Plato now returns to the court, and the king asks him concerning his wonderful invention; and Plato, to illustrate the secrets hidden in nature, relates a story (pp. 55-58) which is a very close version of the well-known legend of Gyges' ring as told in the second book of the *Republic*. A hot vapour, he says, once rent the ground and brought to light in the chasm a hollow horse of tin and copper, with a large fissure in its side. A shepherd saw it and discovered in the body an old man asleep, with a gold ring on his finger. He took it off, and went next morning to his master to learn the value of his booty; but during his visit he discovered to his astonishment that, when he turned the seal towards his palm, he became invisible. He determined to make use of this power, and he proceeded to the palace and secretly entered the council-chamber, where he remained unseen. When the nobles had left it, he revealed himself to the king by this miracle as a prophet. The king at once took him as his minister, and eventually the shepherd succeeded him on the throne. The story can only have come to Nizámí from the *Republic*, probably through some Arabic translation. Wenrich, in his book *De Auctorum Græcorum versionibus et commentariis Syriacis Arabicis Armeniacis Persicisque*, mentions an Arabic translation of the *Republic* (*Kitáb-us-siyásat*) by Honain ben Isḥáḳ; and there is a commentary on it by Averroes. We have next Sikandar's answers to the eight questions propounded by an Indian ambassador (who is however, with the usual error of Persian poets, described as a fire-worshipper), and the different opinions of the seven philosophers on the origin of the world.

One night an angel visits Sikandar and announces that God has chosen him as a prophet, and he is to go through the world with his army, putting down idolatry and vice, and establishing monotheism and virtue. Light is to precede him and bless those who submit to him, while darkness is to follow him and overwhelm his enemies. He is told that he shall understand all foreign languages, and whatever he says in the Rúmí language his various hearers shall at once understand without an interpreter. Faláṭún, Aristo, and Sukrát each make a short treatise of morals and politics, which the king is to consult in all cases of difficulty. Sikandar then commits his kingdom to his son Iskandarús, under his mother's regency, and sets forth from Macedonia on his new expedition. He first goes to Alexandria, and delivers Mecca from a tyrant; then he proceeds westward, and after a long land journey makes a three months' voyage by sea. He at last reaches a land inhabited by barbarians, who fled from him, and, after a month's toilsome journey through a desert of scorching sand, he finds himself on the shores of the ocean—"he remained lost in wonder at that deep sea which the Greek called *Aukiyánús*."* He sees the sun sink into its waters, which are thick like quicksilver and swarm with unknown monsters. He then returns and discovers the sources of the Nile, and also, among other adventures, comes upon the golden gardens and jewelled trees of Shaddád, the famous mythical king of Iram, but leaves its treasures untouched. We have similarly his travels in the South, and the East, and his adventures in their seas, whence the book gets its name; and he also visits the North, where he builds the wall against Yájúj and Májúj, and finds a virtuous race like the Hyperboreans. He then returns to Rúm through Persia, and dies at Shahr-zur, near Babylon, and is buried in Alexandria. Iskandarús resigns the throne, and becomes a darwísh; and the seven sages soon follow the king to the grave, Socrates dying by poison. The poem concludes, as it opened, with a panegyric on Sultán Nusrat-ud-dín, probably the second king of the dynasty of Hazárasp Atábeks which reigned in Laristán.

Ágha Aḥmad 'Alí has edited the text with great care, and has given the variants from several MSS. Some of these are very useful; thus he notices that a MS. from Persia does not contain the absurd lines found in most Indian copies after the account of the deaths of the seven sages, which describe Nizámí's own death, and which were evidently added by some enthusiastic admirer (in India?), although the poem has a proper conclusion by the author, in which he expressly gives the day of the month and the year when

* Ágha Aḥmad 'Alí reads "*ki Yúnání orá Ḳiyánús khánd*;" my MS. reads "*ki Yúnání-ash Aukiyánús khánd*."

the work was finished. I may add that I knew Ágha Ahmad 'Alí well in Calcutta; he is one of the few Maulavís who have a cultivated taste in poetry, and a genuine literary enthusiasm. He promises his readers at some future time an essay on the history of the Masnaví of the Persians and the life and writings of Nizámí. E. B. COWELL.

German Names of Affinity. [*Die deutschen Verwandtschaftsnamen;* eine sprachwissenschaftliche Untersuchung, nebst vergleichenden Anmerkungen, von Dr. Wilhelm Deecke.] Weimar: Hermann Böhlau, 1870.

IN studying the development and the genius of a language it is always useful to devote especial attention to those groups of words which signify a natural system or cycle of related ideas. In cases where we have the means of sifting the exact etymological character of such words to the bottom, we are able to see what sort of connection, if any, exists between these words as words. From this point of view we welcome the treatise named above, although the author has not succeeded in establishing all the results which might have been expected from researches and collections of this kind. This, however, was less the fault of Dr. Deecke than the consequence of the obscurity in which a great part of Indo-Germanic, and especially German, names of affinity is still shrouded.

The work examines about forty words of expressing family relations: *Verwandtschaft, Freundschaft, Sippe* (gos*sip*), *Magschaft, Geschlecht, Ehe, Freite, Heirath, Verlobung, Braut, Vermählung, Gatte, Mann, Frau, Weib, Kind, Knabe, Mädchen, Erbe, Eltern, Vater, Mutter, Sohn, Tochter, Bruder, Schwester, Ahn, Enkel, Vetter, Oheim, Base, Muhme, Neffe* and *Nichte, Eidam, Schnur, Schwäher, Schwieger, Schwager, Wittwer* and *Wittwe, Waise, Stief-* (*step-*, as in *step*-brother). These are treated in two divisions. The first (pp. 13-138) is of less importance philologically, although the scholar will find in it a number of things both interesting and useful. It is chiefly addressed and conveys a generally correct notion about subjects familiar to the general reader, and may serve to awaken or confirm a wider interest in philology. For this purpose an etymology of the words expressive of family relations is given, and an attempt made to determine the root idea out of which the name has arisen. The history of the word is then given as far as possible, and also its ramifications traced in composition, in derivatives, and in secondary applications of it. Not unfrequently too the author digresses more or less fully into social, legal, and moral questions connected with this class of words.

The second part (pp. 141-222) contains notes to the first, and it is to these we wish to call the attention of the student. They consist chiefly of combinations more or less full, and sometimes of great etymological value. Among these are some statements with which we cannot agree; but also a good deal which is at once valuable, novel, and undoubtedly correct, mainly in reference not so much to the names of affinity themselves as to words related to them—*inter alia*, we think the right etymology of the Gothic and Anglo-Saxon *gôd*, Greek *ἀ-γαθ-ός*, and other words of the same family, has here been correctly given for the first time (pp. 170-1); indeed the whole section (pp. 169-71) in which this occurs is a valuable contribution to Indo-Germanic etymology. Other sections are perhaps less successful, and of these, one of the least felicitous is that on the etymology of the word *Braut* (pp. 162 foll.). TH. BENFEY.

Erophile; a Tragedy. [*Erophile, vulgärgriechische Tragödie von Georgios Chortatzes aus Kreta.* Ein Beitrag zur Geschichte der neugriechischen und der italiänischen Literatur, von Conrad Bursian.] Leipzig: S. Hirzel. Pp. 90; 8vo.

IT is well known how greatly the dramatic literature of Italy in the 16th and 17th centuries influenced the dramatic writers of the other European countries, nor need we remind the students of the Elizabethan drama of the fact that in England more than in any other country the study of the Italian literature gave the first impulse to, and promoted the growth of, the great dramatic masterpieces of that age. It is interesting to trace the influence exercised by the Italian dramatists upon other nations to the field of the Greek literature of the period, whose productions appear to be wholly dependent on foreign sources. The two most important works, which may be quoted here, are Vincenzo Cornaro's epic poem *Ἐρωτόκριτος*, which is commonly attributed to the middle of the 17th century, while Sathas (*Νεοελλ. Φιλ.* p. 603) places it in the 18th—the earliest edition he mentions being indeed of 1756—but there is no doubt that this work belongs to the 17th century, as a MS. of it in the Harleian Collection at the British Museum apparently belongs to the beginning of the 18th. We will here, by the way, recommend a future editor of this work not to neglect the MS. in question. The second work of this period, and which is in fact anterior to the Erotocritos, is Georgios Chortatzes' tragedy *Ἐροφίλη*, first printed at Venice, 1675. It seems to be exceedingly scarce at present, though it was frequently reprinted, and seems in its time to have enjoyed considerable popularity—a fact fully attested by some of its lines becoming proverbial and reappearing among the popular songs of the Greeks. Dr. Bursian, a gentleman well known in Germany for his intimate acquaintance with the modern Greek language, has thought it deserving of a somewhat lengthy treatise containing complete analyses of the Greek play and of the Italian tragedy on which it is based, viz. Giovanbattista Giraldi Cinthio's *Orbecche*. It seems to have been Cinthio's habit to use the same subject both for a novel and a drama, so that this practice does not appear to have originated with some modern writers who even go so far as to "secure the right of dramatic adaptation"—we find, at least, that he has again the subject of his tragedy of *Orbecche* in a novel in his *Ecatommiti*, just as the novel on which Shakespeare's *Measure for Measure* is founded was also dramatised by Cinthio himself under the title of *Epitia*. (See Simrock, *Die Quellen Shakespeare's*, 2nd edit. vol. i. p. 152.) His *Orbecche* was originally exhibited in 1541, and published 1547 and again 1561; it must have been one of the favourite plays of the period, and was repeatedly imitated, *e.g.* by Francesco Mondella in his *Isifile* (of which Dr. Bursian also likewise adds a very interesting analysis). It may be admitted to contain many fine passages and beautiful sentiments, but in the manner of the time is crowded with murders and apparitions—forcibly reminding us of Kyd's Spanish tragedy.

Georgios Chortatzes (or, as his name is also written *Χορτάκης*), *ἐκ Ῥεθύμνου*, in Crete, is mentioned as one of the Greek students at Padua in the 17th century, and though Sathas, p. 418, does not identify the student of Padua with the author of *Erophile*, of whom he speaks p. 339, we have not the slightest hesitation in considering them as one and the same person. It was no doubt in Italy that Chortatzes became acquainted with Cinthio's *Orbecche*, and there also we may suppose him to have contracted that familiarity with Tasso's *Gerusalemme liberata* which appears in the intermezzos of his play. It is, however, extremely creditable to him that, though imitating an Italian play, he was to all intents independent of it in his choruses, which are in fact

manifestly modelled upon those of Sophocles in his *Antigone*. It must, indeed, be high praise to allow that Chortatzes' choruses are spirited and elegant imitations of the immortal and celebrated songs in *Antigone*. It is, moreover, admitted by Dr. Bursian that the alterations made by Chortatzes in the plot and arrangement of the tragedy itself are decided improvements on his original. The point where he errs is the common weakness of the whole modern Greek dramatic and epic literature—we mean the predominance of the lyric and sentimental elements by which the action of the drama is frequently retarded.

Dr. Bursian, being unable to discover a printed edition of the *Erophile* in any German library, was obliged to form his analysis upon a MS. copy now in the Munich Library (Cod. Gr. 590), but originally belonging to Pater Fischer, the confessor of the unfortunate Emperor Maximilian of Mexico. Even in the Italian libraries the work was found to exist only at Venice, and there in a somewhat late edition of 1772. Dr. Bursian was not aware that an earlier edition is in the British Museum (k 868. c. 41): Τραγῳδία ὀνομαζομένη Ἐρωφίλη, ποίημα τοῦ λογιωτάτου ἐν σπουδαίοις κυροῦ Γεωργίου Χορτάτζη Κρητός. Ἐνετίησιν, παρὰ Ἀντωνίῳ τῷ Ἰουλιανῷ, αχλζ' (1735). Sathas (p. 339) attests that even in Greece this tragedy is "completely unknown" (*πάντῃ ἄγνωστον*), in spite of its many beauties. It is, therefore, to be regretted that we have no recent reprint of it, and the sooner we get it, the better. If, after the end of this unfortunate war, M. Legrand finds time and spirits to continue his *Monuments pour servir à l'Histoire de la Langue néohellénique*, we hope that he will soon give us an edition of this play—without, however, forgetting to collate the Munich MS. with the printed copies.

Dr. Bursian's treatise can be fairly recommended as an interesting contribution to the literary history of the 16th and 17th centuries, and well repays perusal.

W. Wagner.

Intelligence.

Signor Gherardo Nerucci of Pistoja has published his Italian translation of Professor Max Müller's *Lectures on the Science of Language*. The two volumes of the English edition have been divided into three. The same plan was adopted in the French translation by M. G. Harris and G. Perrot. They divided the second series of lectures into two parts, the first called "*Phonétique et Étymologie*," the second, "*Influence du Langage sur la Pensée, Mythologie ancienne et moderne*." A second edition of the German translation by Dr. K. Böttger appeared in 1870. There is also a Russian translation published at St. Petersburg in 1865. A new and cheaper edition of the English edition is advertised by Messrs. Longmans.

A large collection of Biblical and Rabbinical Hebrew Literature has been offered for sale *en bloc* by Mr. F. Müller, of 130 Heerenkracht, Amsterdam. It consists of about 2800 works, 1600 of which fall under the head of Hebrew, and 1200 of miscellaneous Jewish literature, and includes 60 MSS., most of them unpublished. One of the Hebrew MSS., written on vellum, dates from the 12th or the first half of the 13th century. We are not surprised to hear that several American libraries are competing for the possession of this varied collection. The price asked is 10,000 florins.

Señor Pascual has undertaken an interesting investigation into the number of words of Teutonic origin which occur in the Spanish language; and he furnishes some of the results of his researches in the last number of the *Revista de España*. It has been calculated that about six-tenths of the Spanish words are of Latin origin, one-tenth Arabic, one-tenth Teutonic, and the rest miscellaneous. But there has been an immense influx of English words into common use, since the introduction of railways, banks, improved engineering, and constitutional forms.

The *Kölnische Zeitung*, Feb. 4, contains a paragraph calculated to throw theologians as well as Egyptologists into some excitement. A Cairo letter, dated Jan. 15, is the authority. Professor Breugsch (? Brugsch), it appears, has discovered the ruins of a town "very likely built by the Jews," situated near the little town Dell-el-Jahud (hill of the Jews), two hours by rail from Cairo. Up to the present time the remains of a temple and a fountain of the most beautiful ground alabaster have been brought to light, together with inscriptions in good condition, and several rows of houses.

Selected Articles.

Perles' Etymological Studies, rev. by Nöldeke, in Gött. gel. Anzeigen, Jan. 25. [Contains important contributions to etymology, but might have been improved by more attention to phonetic laws, and a larger acquaintance with Syriac literature.]

Marquis d'Hervey's Lù Sao, rev. in Lit. Centralblatt, Feb. 4. [Favourable.]

The Literature and Religion of the Buddhists, by B. H. Hodgson, in the Phœnix, Nos. 5, 6, and 7.

Beiträge zur vergleichenden Sprachforschung, vi^ter Bd. 4tes Heft. —Zum deutsch-preussischen Vocabular, von Nesselmann, rev. by W. Burda. [Suggests that N. has sometimes printed *l* when the MS. has a long *s*. Offers a solution of the obscure word *rikisnan*, a ridge.]—Visuccius Mercurius, ein Beitrag zur Geschichte der lateinischen Assibilation auf gallischem Boden, von K. Christ.—Studies on old Prussian, by C. Pauli. [On the vocabulary mentioned above. Contains a careful comparison of Pomeranian and Lithuanian vowels and consonants: concludes, as against Schleicher, that the former is not a mere dialect of Lithuanian.]—The Old Irish Verb, by Whitley Stokes. [Adds to the known examples a large collection drawn from the *Félire of Oengus*, the *Amra* Cholium-chille and other monuments in Ireland not generally accessible. The theory of agglutination is pushed to its utmost limits in connection with the later forms of verbs.]—Lithauische Dichtungen, von Christian Donalitius, rev. by J. Schmidt. [Edition only useful when compared with Schleicher's: Nesselmann's notes contain some singular mistakes.]

THE ACADEMY *will in future appear regularly on the 1st and 15th of every month.*

General Literature.

The Poems of Catullus. R. Ellis. London: John Murray.

PROFESSOR ELLIS concludes his interesting preface by saying that he will be contented to "please the, even in this classically trained country, too limited number of readers who can really hear with their ears." His beautiful and elaborate translation is before everything else a metrical experiment, on the same principles as but on a larger scale than those bound up with *Enoch Arden and other Poems*, and so is appropriately dedicated to Mr. Tennyson. The prettiest of Mr. Tennyson's experiments is devoted to quizzing its own futility; but Mr. Ellis' experiment is made quite seriously and hopefully. He believes that classical metres may be naturalised if the classical rules of quantity and position are observed in addition to the English accent. He has certainly proved to those "who can really hear with their ears" that in these principles it is possible to obtain very beautiful metrical effects, and to produce at least by snatches very fresh and dainty poetry. At the same time it hardly seems that even he has fully realised the difficulties of the problem. The difference between Catullus read and Catullus scanned shows how much easier it is to write Latin metres in Latin than in English, for it shows how often Catullus set aside the Latin accent. Again, there are many words, as the Elizabethan metrists had already observed, in which accent and quantity are hopelessly at variance. Professor Ellis' rule excludes all these words, and so narrows the vocabulary available. Then a reference to Juvencus suggests the great difficulty of all. Juvencus was a very sorry poet; he entirely neglected position, he scarcely attended to quantity, yet his hexameters are certainly much better than Mr. Kingsley's, because the average length of Latin words offers an abundant choice of easy cæsuras. Though he has preferred not to discuss this difficulty in theory, Mr. Ellis has obviously felt it in practice, and made strenuous and not unsuccessful efforts to overcome it. His hexameters have almost always one satisfactory cæsura at any rate; his lyrical metres are not much looser in structure than the original: it is only in the pentameters that he is ignominiously vanquished by the irrepressible monosyllable. In the *Attis*, certainly the greatest metrical achievement of Catullus, perhaps of Latin poetry, the translator may be said to have achieved an almost unqualified metrical success. In pursuit of this the translator has not wholly escaped the peril he foresaw of a possible loss in freedom of expression. For instance—

> "Ego mulier, ego adolescens, ego ephebus, ego puer,
> Ego gymnasî fui flos, ego decus olei.
> Mihi januæ frequentes, mihi limina tepida,
> Mihi floridis corollis redimita domus erat,
> Linquendum ubi esset orto mihi sole cubiculum.
> Ego nunc deum ministra, et Cybeles famula ferar?
> Ego Mænas, ego mei pars, ego vir sterilis ero?
> Ego viridis algida Idæ nive amicta loca colam?
> Ego vitam agam sub altis Phrygiæ columinibus,
> Ubi cerva silvicultrix, ubi aper nemorivagus?"

is much more emphatic because freer than the following, which is plainly overlaboured, though still very rapid and very passionate:—

> "Who a woman here, in order was a man, a youth, a boy
> To the sinewy ring a famed flower, the gymnasium's applause.
> With a throng about the portal, with a populace in the gate,
> With a flowery coronal hanging upon every column of home,
> When anew my chamber opened, as awoke the sunny morn.
> O am I to live the gods' slave? feodary be to Cybele?
> Or a Mænad I, an eunuch? or a part of a body slain?
> Or am I to range the green tracts upon Ida's snowy chill?
> Be beneath the stately caverns colonnaded of Asia?
> Be with hind that haunts the covert, or in hursts that house the boar."

This is a favourable specimen, but even here the second line contrasts very unfavourably with the simplicity of the original, and "the high columns of Phrygia" are ill replaced by "the stately caverns colonnaded of Asia." In general it must be admitted that metrical exigencies have Latinised both the constructions and the vocabulary much further than is desirable, and we notice also that the hexameters of the second epithalamium end with a verb or a participle far oftener than those of the original. The pure iambic trimeter seems to have been more troublesome than any other metre: harsh inversions abound, and the immeasurable length of line drags heavily. The scazons are better, but too often the first syllable of the final spondee is only long by position, a defect the more to be regretted because it might have been completely remedied. For instance—

> "O thou my Sabine farmstead or my Tiburtine"

is in a quite different metre to—

> "O thou of islands jewel and of half-islands,"

and only the last is really in the metre of Catullus.

The translation of course possesses all the value of a commentary, but we can scarcely believe that vv. 21-23 in c. x. were intended to be taken as part of Catullus' speech to Varus' mistress; Catullus could not have boasted of having bearers and such a shabby litter that he could not use them. In general we are inclined to think that the translator has not taken sufficient account of the simplicity of Catullus; he is dainty as Catullus is dainty, but he is not natural as Catullus is natural. Something may be due to the fact that he is obliged to lengthen the original and therefore to ornament it; but a pair of lines like this—

> "Widely from each fair limb that footward-fallen apparel
> Drifts its lady before, in billowy salt loose-playing"

is too plain an instance of the refracted influence of Mr. Tennyson. Here we have "each fair limb" for her "whole body," "footward-fallen" for "before her very feet," "billowy salt" for "salt sea waves," and "loose-playing" for "playing," all prettinesses which should have been superfluous. We close with an extract which is almost unexceptionable as well as really beautiful:—

> "Him for very delight when a virgin fondly desiring
> Gazed on, a royal virgin, in odours silkily nestled,
> Pure from a maiden's couch, from a mother's pillowy bosom,
> Like some myrtle, anear Eurota's waters arising,
> Like earth's myriad hues, spring's progeny, raised to the breezes,
> Drooped not her eyes their gaze unquenchable, ever-burning,
> Save when in each charm'd limb to the depths enfolded, a sudden
> Flame blazed hotly within her, in all her marrow abiding."

G. A. SIMCOX.

LITERARY NOTES.

We understand that Mr. J. A. Symonds, late Fellow of Magdalen College, Oxford, is editing the miscellaneous works of the late Professor Conington. An introductory memoir written by Professor H. J. S. Smith will be prefixed to the collection, which will contain besides various essays on Latin and English literature a complete prose translation of the works of Virgil.

The cartoons reprinted in *Vanity Fair Album* have the merit of depending only on character and expression for their comic effect. Some of the portraits are really excellent examples of the difficult art of making a fair likeness amusing without the help of a laughable situation. MM. de Lesseps and Henri Rochefort look almost too imaginative to be English; but in others the familiar expression is scarcely exaggerated, only just a little heightened, as in the case of the Bishop of Winchester, to give point to the legend "Not a Brawler." Some of the "Sovereigns" are so good that it is a pity the series is not more complete. The constitutional King of the Belgians, with an expression of dancing a hornpipe between crossed swords, with his arms full of valuable property, is particularly happy. The artists should be on their guard against the temptation of making people who have really no distinguishing feature look funny by attenuated legs and crooked necks, and as the turn of the literary world must come after the list of statesmen, eminent or otherwise, is exhausted, it is to be hoped that its members will be treated generally with more appreciation than Carlyle. "The Diogenes of the Modern Corinthians" might have been represented as blear-eyed and decrepit, but there should have been something to indicate that he was dazzled by the light of his own lantern, and bowed down by the magnitude of his aspirations. The letterpress is of course unequal, as it is not easy to find a good epigram for every week in the year, and the last volume contains, perhaps, nothing as good as the mottoes for the Marquis of Hartington and Mr. Chichester Fortescue in 1869. At its best, the series is really valuable.

Mr. Charles Reade's new serial in *Cassell's Magazine* settles a difficult question which had troubled his readers in the *Cornhill* and elsewhere. His melodramatic situations are *not* meant for burlesque. It remains to be seen whether his undoubted literary dexterity will enable him to supplant the novelists of the *London Journal* in the favour of the peculiar public which he is stooping to conquer.

Art and Archæology.

Primitive Greek Art. [*Zur Geschichte der Anfänge Griechischer Kunst.* Von A. Conze.] 30 pp. 11 pl. Vienna, 1870.

The learning and acuteness of the author of *Contributions to the History of Greek Sculpture* have been shown in more than one valuable constructive speculation in the field of archæology. From English students in especial he may claim recognition, in right of his account of the Fitzwilliam Museum (ap. Gerhard's *Anzeiger*), his paper on an important Cameirus plate of the British Museum, and most of all perhaps the essay (*Archaeol. Zeit.* 1865) in which he has argued that in a fragmentary marble shield with miniature reliefs, in the British Museum, we have a reduced variation of that portion of the shield of the Phidian Athene Parthenos which we know to have contained the portrait of the master himself.

Dr. Conze has given rather too comprehensive a title to his present treatise; which is in fact a monograph, reprinted from the Transactions of the Vienna Academy of Sciences, on a particular division of the most ancient class of Greek fictile works. This class, known generally in arrangements of the vases as "archaic" or "Phœnician," and comprised in one by Mr. Oldfield (*Trans. Roy. Soc. Lit.*, N. S., vi. 141), by Mr. Bunbury (*Edinb. Rev.* 1858), and some other authorities, had been divided by Dr. Birch into "earliest style" and "archaic Greek" (*Hist. Anct. Pott.*, i. 252, 257),—Mr. Burgon having already in 1844 led the way, and maintained that the very earliest vases of the class belonged to the Cyclopean or heroic period of Greek history. Certain specimens figured by Mr. Burgon may, as he conceives, "be referred to a period ranging from B.C. 1200 to B.C. 1000, and probably earlier" (p. 291); whereas the animals (of which more hereafter) that appear on certain others of the same general style indicate in his judgment a somewhat later age, B.C. 1000 to 800 (p. 283). Here is his description, quoted by Dr. Conze, of the style (*Trans. Royal. Soc. Lit.*, N. S., ii. 259):—

> "This pottery is of the natural colour of the clay, varying from a whitish yellow or pale ochreous colour to a light brown. These various tints of the ground are generally more or less ornamented with zigzag or numerous parallel lines, bands, concentric circles, mæanders, and various other forms, of a tawny red or brownish colour, sometimes merging into dusky black."

The vase from Melos figured by Mr. Burgon is nearly identical with other examples found in Cyprus. Dr. Conze in his dissertation directs especial reference to a quantity recently discovered in Cyprus, both by others and by General de Cesnola. It is a characteristic of the entire class that human figures are excluded from their ornamentation; although there are exceptions to this rule in the Dodwell vase and also in the Cameirus plate described and figured by our author himself some years ago, and it may be presumed that another exception occurs in the example from Idalium with two men in a biga, described as lot 36 in Messrs. Sotheby's sale catalogue of a portion of Cesnola's collection (Feb. 9, 1871).

Dr. Conze insists on the necessity, as already indicated, of subdividing this primitive ware into an earlier style and a later style. The earlier archaic style, then, is destitute of conventionalised plant or flower-forms, and has its ground decorated exclusively with straight bands, zigzags, single or concentric circles detached or connected by tangents, frets, oblique lines, and the like; besides comparatively rare representations of animals, roughly drawn according to a peculiarly lanky pattern, and consisting mainly of horses, rams, deer, and long-legged water-fowl, to the almost entire exclusion of the lion and tiger, and also of composite forms such as sphinxes and the like. The later archaic style (not to insist on some minor differences in the clay, the manner of execution, as well as the forms of the vessels) has animals very frequently occurring and quite differently treated, with shorter and more natural limbs, more attention to anatomy, and a preference for curved outlines, the animals themselves being moreover in great part different, with a predominance of the lion and tiger, as well as a variety of imaginary composites. Here, moreover, the ground is covered not only with linear decorations, but with rude patches clearly representing conventionalised plant forms.

Of this latter style the Dodwell vase, from Corinth, is a well-known example; and the whole subdivision to which it belongs has been sometimes called Corinthian. In like manner, for the other or oldest subdivision of all the general name Phœnician has been sometimes usurped. Dr. Conze demurs altogether to both of these names; and contends that the later archaic style, in its abstract plant ornament and in the spirited conventionalism of its animal design, shows unmistakably the importation of "Oriental" (*i. e.* Semitic, or at all events non-Aryan) decorative elements; he therefore calls this the "Orientalising" style. Those remains of the still more ancient kind found in Cyprus, and identical remains from other islands of the Archipelago, he on the other hand maintains to be precisely exempt from all these tokens of Oriental influence; and would therefore

call them by the much-abused name of Pelasgian, or, better, Aryan. That is to say, he would have the style to be a relic of the so-called Pelasgic period, in which the first pioneers of the Hellenic stock, having in their migration peopled the coasts and islands of the Archipelago, retained their primitive civilisation unfertilised by Oriental or "Asiatic" influences. Independent evidences point to the pre-historical occurrence of such fertilisation through the medium of Phœnician commerce; and from the earliest wave of this commerce would date the gradual introduction of the later archaic or Orientalising style. As far back at least as the period of the epic poets, the art of the Assyrians in reliefs and bronzes had become the beau ideal of Greece; and of it the miscalled "Corinthian" system of vase decoration is in great part an echo. And as this style was anterior to the development of a Hellenic style proper, so the Aryan style miscalled "Phœnician," according to Dr. Conze, was anterior to this, and in its origin therefore of a far higher antiquity than has yet been claimed for it.

This speculation our author extends and confirms by comparing the ornament on the earliest vases of Cyprus with that found on the bronze remains of Central and Northern Europe. He declares that the two orders of ornament are identical, and that both bear the signs of having been originally appropriated to textile fabrics, and from this use transferred to the decoration of implements. Finding identical styles thus in use by two separated branches of the Aryan stock, he concludes that this is the primitive mode of ornamentation invented by the stock (and probably for textile purposes) before their migration and dispersal.

In all this it is impossible not to admire a certain breadth of view, accompanied as it is with scholarly and ingenious treatment; but whether the speculation is available for serious purposes is a different and withal difficult question. Of its correctness the vases themselves here and there raise a suspicion, as our author candidly admits. On pl. xi. he figures two which in general form and character, and especially in the mode of representation of their animals (lions) would seem to lie midway between the two subdivisions of the class to which they belong. He meets the difficulty by supposing them made at a time when the old style had not quite died out, nor the new (if we may so call it) become firmly established. And this, it cannot be denied, is a very plausible solution, especially if considered in connection with the contemporary occurrence of black figures and red figures on later vases of the Æginetan and Strong styles.

We wish, however, that Dr. Conze had refrained from bringing the lion into his argument, as evidence of a specifically Oriental character in those vases where it is depicted. This animal actually existed in Northern Greece as late as the time of Pausanias, and occurs in early Greek mythology (witness the lion of Nemea), in early sculpture at Mycenæ, and in early coinage, as the money of Macedonia and Magna Græcia, particularly that of Velia.

The vases themselves suggest further and still stronger doubts. The mæander ornament or key fret, which enters in various forms into Greek vase decoration from the very earliest to the very latest times, occurs also in early (we know not how early) Japanese ornaments, and on the tombs of the early Peruvians (Birch, i. 263). Dr. Conze, in pl. ii., gives a representation of a matted pattern enclosed in acute-angled triangles, forming part of the ornamentation of one of the earliest vases: fragments of pottery very similarly ornamented were found at a considerable depth below ground in Jerusalem (exhibited Museum of the Palestine Exploration Fund, 1869), and can scarcely be regarded as anything but Semitic or Oriental. Once more, the close resemblance between the connected circles of his Aryan subdivision, and the guilloche pattern or intersecting circles of his Orientalised subdivision, has been pointed out by Dr. Conze himself.

The evidence of inscriptions, so far as we know, is wholly wanting in the case of these vases. Pending more complete proofs, we must hold it doubtful to which millennium before our era either the one subdivision or the other by origin belongs; and must consider the attempt to trace in them ethnic individualities of decorative style as at any rate premature. Possibly just as good a case might be made out on the other hand, to show that in their very earliest forms of ornament the most unconnected families of nations nearly resemble one another. In the mean time Dr. Conze's pamphlet has to be acknowledged as quite a little model of terse and suggestive exposition by a master of his subject.

CHURCHILL BABINGTON and SIDNEY COLVIN.

ARCHÆOLOGICAL PROCEEDINGS IN ROME.

Rome, Feb. 21.

NOT many new discoveries have been made, but many undertakings of promise have been continued, since I wrote last, under direction of the Commission appointed by the present *régime*. The two principal sections of the Palatine, in one of which the Napoleonic, in the other the Pontifical government, had been carrying on works for several years, are now thrown into one estate, where the excavations at this moment progressing, are alike under the direction of Signor Rosa. The labours in the Forum continue, but have not advanced farther than the Julian basilica and the vicinity of the column of Phocas. The total demolition of the Salarian gate, the *débris* of whose massive stonework now lies on the wayside, has been regretted and protested against. Why, it is asked, destroy that interesting monument of the Honorian period, which spoke of the tragic vicissitudes of a declining empire, of the last struggles against barbarian invasion, and the first dread shock by which the spell of inviolability was broken, when, on the night of the 24th August, A.D. 409, Alaric entered Rome at the head of his Gothic army through this towered gateway? It has been urged that it was necessary to destroy it, owing to the injuries suffered in the siege on the 20th September; but this cannot be believed by any one who saw (as I did) the condition in which that "Porta Salaria" stood during the first days and several weeks after that memorable attack. Nor does it seem of importance that a gateway, built according to modern systems of defence, should be substituted for the ancient one on this side of the city, opening upon a road (the Salarian, still known by its classic name) one of the least frequented, and which leads to no great city. The proposed restoration is to be from the designs of the architect Vespasiani, whose work is ready, and has been praised; and the new gateway is to be called after Victor Emmanuel. For the loss of the *old*, archæology has been compensated by a discovery of special interest, which has been attracting numbers to that site. Within one of the round towers flanking this ancient "Porta," on the right as one leaves the city, and completely embedded in the Honorian structure, has been found a large quadrangular monument, the basement and lower storey alone preserved, together with a cippus of considerable elevation rising at the south-western angle. The ample basement is adorned with plain mouldings and flat pilasters of travertine, the wall between which is of peperino. In the upper and more ruinous part it is evident that more than one sepulchral chamber must have been opened. On the front of the cippus is a high relief in an arched recess of a youth wearing the toga, and holding a scroll in one hand; the lateral surfaces and the ample space below being covered with an inscription in Greek and Latin. The cippus is crowned by an entablature of good style, and also adorned, at the narrow sides, by bas-reliefs of an urn or sacrificial vase, and a patera. The epitaph is especially interesting, for it informs us that the deceased, a boy in his twelfth year, was a poet, who wrote and extemporised in the Greek language. On a lintel under the relief-statue are the words *Deis Manibus Sacrum*, and below the following lines:—

"*Q. Sulpicio Q. F. Cl. N. Maximo Domo Roma. Vix. Ann. XI. M. V. D. X. Hic Tertio Certaminis Lustro Inter Graecos*

Poetas Duos Et L. Professus Favorem Quem Ob Teneram Aetatem Excitaverat In Admirationem Ingenio Suo Perduxit Et Cum Honore Discessit Versus Extemporales Po. Subiecti Sunt Ita Parent. Adfectib. Suis In Dulciss. F. Vid. Q. Sulpicius Eugromus Et Licinia Januaria Parent. Infelicissim. F. Piissim. F. F. C. Et Sibi P.

ΕΠΙΓΡΑΜΜΑΤΑ.

Below this are twenty metrical lines in Greek, divided into two columns—the composition, no doubt, of this gifted boy. Having only a photograph of the tomb to avail myself of—the promised engravings, with explanatory text, not being yet supplied—I regret that I cannot transcribe the Greek, much of which is to me illegible, though in well-formed letters. Some words in the same language are seen on the scroll held in the statue's right hand. The left hand and part of the face are mutilated; but what is preserved gives the idea of a countenance and expression proper to riper years than those of the youth represented. Other remnants of tombs, one circular, another quadrangular, and built in travertine, have been found, alike concealed for centuries within the brick towers of the gateway; also a few other inscriptions, one being the brief epitaph of Licinia Januaria, mother to the poetic Sulpicius Maximus. It may be inferred that different patrician families owned a group of mausoleums on this spot. Amidst similar conditions was found, in 1838, the very curious sculptured tomb of the baker Eurysaces in the Via Labicana, alike sacrificed to the Honorian fortifications, outside the Porta Maggiore.

Christian antiquities and all excavations in the catacombs are still left under the experienced care of the Cav. di Rossi, and the nominal superintendence of the Cardinal Vicar, to whom alone that gentleman is responsible. The most important of such works now in progress are those in the Catacombs of Prætextatus; and di Rossi's *Bulletino* (No. 1 of second series) gives a full account of these—at least of all that has been recently done—the most interesting details having reference to an arcosolium, shown by the remnants of marble and porphyry ornamentation to have been of much magnificence; and a singularly formed apse opposite to that splendid tomb, with a spacious semicircular area, and in this place, where might have stood an episcopal chair, an entrance to a long corridor; this arrangement being evidently intended for accommodating the many worshippers who used to visit and pray before that arcosolium. Other works in the Callixtan Catacombs, and in that of Priscilla on the Salarian Way, have been continued, and will be the subject of other reports promised by di Rossi. Another interesting discovery in this range is a corridor of the S. Agnese Catacombs, entered below that ancient basilica on the Nomentan Way, and therefore at some distance from the public entrance, long known and open to all visitors, into the same hypogee. This entrance from the church is the original one, long supposed to have been destroyed, and has been found through the enterprise of the monks, Lateran canons, who reside at the monastery restored by Pius IX. at the S. Agnese basilica. Those monks have had the good sense to leave all undisturbed, exactly as found; the tombs still unopened, the original inscriptions in their places. Contiguous to some of those Christian graves are remnants of the lamps by which visitors were guided to the spot, and also of the phials, bearing marks of red fluid, which have long been regarded as certain signs of martyrdom, their contents being supposed no other than the blood shed by the deceased for faith or conscience's sake. I need not here attempt to weigh the arguments of the antiquarians who assert that this theory is erroneous, and that the liquid found in such vessels is nothing else than wine, probably sacramental.

The last number of di Rossi's *Bulletino* is dedicated exclusively to the subject of the S. Clemente basilica, the subterranean church opened beneath the more modern edifice, and the temple of Mithras, recently discovered at a still lower level than that church, now reduced to the state of a crypt. Referring to this subject, I feel the necessity of paying tribute of gratitude to the estimable Prior of the Dominican convent, Father Mullooly, to whom these discoveries are due. Of the Mithraic temples, remains of which have been found in or near Rome, this is the only one that presents the form of the *spelaeum*, or sacred cavern; as also did another opened at Ostia in 1797, but since then destroyed. The learned writer's theory, sustained with much force, is that the vaulted hall of that Mithraeum was not originally destined for that Oriental worship, but was no other than the oratory formed for Christian rites in the mansion of Pope S. Clement, taken away from the Christians during one of the pagan persecutions, and restored to them by Constantine. The "memoriam Clementis," which the "exstructa ecclesia" preserved in the time of S. Jerome, on the Cœlian hill, may consequently be recognised in this cavernous hall, now seen by torchlight so far below the level of the church actually in use. A singular detail here observed, the podium of some height, carried round the interior, corresponds to what we see in the other Mithraic temple, opened a few years ago at Ostia; but differs in that its summit, instead of being level, as in the Ostian example, is for the whole extent oblique, sloping downwards to the wall, so that worshippers could neither have stood nor knelt upon it without inconvenience. This di Rossi accounts for by assuming that the sacred banquets were held here, the guests reclining along this podium, the viands and tazze, &c., being placed along a flat ledge, with semicircular recesses at intervals, which projects from the inclined platform towards the central area. A bas-relief found in the Tyrol, and cited in support of this view, represents precisely the banquet, with guests reclining on couches, as the last scene among Mithraic initiations, or rather the crowning festivity after the trial of the neophyte by various ordeals, and the symbol of his celestial reward. This Mithraeum at S. Clemente was also made the subject of an ably written paper by the Cav. Carlo Visconti, read, in an English version, at the last meeting but one of the British Archæological Society. The last lecture at the weekly meeting of the British Society was translated from a carefully compiled account of the public works and monuments of Trajan by Signor Lanciani, a young Roman architect; and one of the interesting papers lately read before that audience was on the Leonine City and the S. Angelo Castle, by Mr. Parker.

Among noteworthy subjects recently brought forward by the German Archæologic Institute here was the recently discovered ruins of a temple of Diana in the lake of Nemi, below the picturesque village which bears the same name. That temple seems to have been a sanctuary of important character. A long inscription, among its extant contents, gives a list of the objects there deposited or used—tripods, tazze, female ornaments, &c.; the inferior style indicating a date not earlier than the second century of our era. Two papers on these remains were read by Dr. Henzen at the Friday meetings of the Institute. Archæology is still, as under the Pontifical government, almost the only theme illustrated or attempted by such literature as appears—apart from political journalism—in Rome. C. I. Hemans.

ART NOTES.

Marquis Campori of Modena, whose contributions to the literature of the fine arts have been of late both numerous and important, recently read some interesting papers before the deputation for national history at Modena. These papers comprise original correspondence found in the Mantuan archives relative to the connections of Giovanni Santi and Raphael, with the family of Gonzaga. We thus learn for the first time that in 1494, Santi was employed to paint two portraits, that of Elizabeth Gonzaga Duchess of Urbino, which was to be sent to Mantua, and that of a Monsignore, which was to be taken to Urbino. Campori supposes the Monsignore to have been Lodovico Gonzaga, Bishop of Mantua. He was sick when Santi came to Mantua, and gave the painter no sittings. On Santi's return to Urbino, it was his turn to be sick, so that he made no use of the sittings offered by the duchess. Santi died in August 1494, without painting the likenesses. The connection which began with the father continued with the son, and Raphael had frequent interviews at Rome with the Gonzagas. In 1513 he painted the likeness of Foderigo Gonzaga, then detained as a hostage by the Pope; and the documents on the subject of this likeness prove the date of its execution as well as its subsequent existence in the Mantuan Gallery. A proof is thus afforded to us that the following item in the catalogue of Charles I.'s collection refers to a genuine Raphael: "Done by Raphael Urbin, a young man's head without a beard, in a red cap whereon a medal, and some part of his white shirt, without a ruff, in his long hair, being the Marquis of Mantua. The picture being only a head so being as the life."

Other documents read on the same occasion add a link to the chain of proof enabling us to determine that the Madonna della Perla in Madrid is the picture known to old writers as the Madonna of the house of Canossa at Verona.

Amongst new collections recently made accessible to the public, we have to notice that of the Fürstenberg family at Donaueschingen. The works of art belonging to this family have been put together in an appropriate building and catalogued by Alfred Woltmann, the clever and well-known author of the life of Holbein, now professor at Carlsruhe. Amongst the treasures most worthy of notice we should register twelve scenes from the Passion by the elder Hans Holbein, and works by Zeitblom and B. Beham.

Few visitors to Aix-la-Chapelle will have left the town without seeing Rethel's frescoes in the townhall illustrating the history of Charlemagne. The whole series has just been engraved for the Art Union of Rhineland and Westphalia.

The *Portfolio* for the 1st of March contains a very interesting photograph from Mr. Holman Hunt's first drawing for the central figures of his "Christ in the Temple." Mr. Hamerton's paper on kids is written with a great deal of grace and insight, but the little designs which accompany it are not only slight but inadequate and even unpleasing.

In the *Italian Official Gazette* for Feb. 14, we find mention of the discovery in the parish church of Corbetta, a village in the district of Abbiategrasso, of a fresco signed *Anno* 1475, *die x Octubr. Gregorius de Zavatarijs pinsit.* This puts us in possession of an unquestionable work of the painter Gregorio Zavattaro, in addition to those of the chapel della Regina in the cathedral at Monza, which are authenticated by an inscription as having been executed at any rate by members of his family.

A moot question of attribution has always been that of the famous Italian engraving styled "Stregozzo" or "Carcasse"—a witch with a pot of fire riding on the skeleton of a whale, with an attendant train of men and fiends, and a background of sedge and bulrushes. The ordinary copies bear the monogram of Agostino Veneziano, sometimes in two places; and the plate is certainly of his cutting, either alone or in conjunction with Marc Antonio. The design has been set down by some to Michel Angelo, and by others to Raphael, or might not impossibly be by Giulio Romano. But a little picture on copper contributed by the Duke of Wellington to the Exhibition now open for the Distressed Peasantry of France, gives strong testimony in favour of the second of these attributions. It is a copy after the engraving in question made by Spagnoletto, and signed "R. V. inventor. Josephf de Ribera pinxit." R. V. is Raphael Urbinas, and the signature thus shows to whom the design was considered due within about a century of its publication, by those from whom Spagnoletto got his information.

Music.

Beethoven. Von Richard Wagner. Leipzig: Fritzsch.

It is always interesting to read what a man of high creative genius has to say of the work of others. Such criticism, besides its direct value as criticism, reveals much of the principles and motives which guided the author in developing his own creations. For instance, Schiller's essay on Goethe's *Egmont* furnishes us with a deep insight into the poet's own workshop; and in the same way the critical writings of Robert Schumann might almost be called the programme and keynote to his music. The same and even a greater interest attaches for a similar reason to Wagner's pamphlet written for the centenary of Beethoven, because the "music of the future," according to its founder's words, is only the development of Beethoven's gigantic ideas as represented by the works of his last period. As might be expected, Wagner's essay is not a mere panegyric, like those which appeared in Germany by dozens on this occasion; he himself desires that this work should rather be considered as a contribution to the philosophy of music. Indeed it contains almost the whole idea of this art and its development in a nutshell, with the main object of determining the place of Beethoven's compositions as a stage in this development.

It is remarkable that in the most musical and most philosophical country of the world the philosophy of music has been inadequately handled by its deepest thinkers. Even Leibnitz saw in it only an "exercitium arithmeticae occultum nescientis se numerare animi," while in our own times a man like Friedrich Vischer left the musical department of his *Aesthetik* to be worked out entirely by a friend, confessing his own ignorance of the subject. The first German philosopher who was not frightened by the dark clouds hanging around the theory of this art is Arthur Schopenhauer. And as the ideas of the chapter on music in the *Welt als Wille und Vorstellung* form the foundation of Wagner's speculations on the same problem, it may be worth while to enter into some of the details of this interesting but complicated subject, "the philosophy of music."

The aim of all arts, save one, is—Schopenhauer says—to express the archetypal ideas which, following Plato, he conceives to be the forms that fashion the Cosmos. Arts like painting and sculpture, the drama and the ballet, embody those ideas as conceived by the artist through the medium of these phenomena, and even lyrical and epic poetry avail themselves of the actual facts of life and the visible wonders of the world. It is otherwise with music. The harmonies and melodies of the composer are "as immediate and direct an objectification or copy of the will of the world as the world itself is, as the ideas are, of which the universe of things is the phenomenon. Music is thus not the 'copy' of the ideas, like the other arts, but a representation of the cosmical will co-ordinate with the ideas themselves" (*Welt als Wille und Vorstellung*, vol. i. p. 304). In this respect the musical composer is the only *creative* artist. While the painter or sculptor must borrow the raiment for his idea from the visible beauty of the human form or the landscape, the musician is alone with his inspiration; he has only to listen to the voice of the spirit of the world, or, which is the same, of his own spirit, speaking to him as in a dream. For it is only in dreams when the senses leave the soul undisturbed, that this state of self-absorption is attainable.

Building on this foundation, Wagner proceeds to reason as follows. Since music borrows nothing from the outer world, it must be free from the limits of space and time, which are only the conditions under which the outer world is apprehended by the human mind. Indeed, that which is the most purely musical in music, harmony, and the pieces which are framed chiefly upon harmony, so far from being dependent upon time, can scarcely be measured by it. Thus, in Palestrina's works the change from one chord into another is hardly perceptible, and rhythm as an independent principle can scarcely be said to exist. It is rhythm which connects the purely spiritual art of transcendental music with time, for rhythm is, according to Aristoxenus, only a regular return of shorter and longer portions of time as manifested by a movement performed in this time, and in music this movement is the μέλος or tune. Rhythm is therefore a foreign element in music proper, and compositions which, like dances, are entirely founded on it are of a much lower order than those where the melody grows organically out of harmonious relations.

The limits of music as an independent art are the same as its powers. It must and can express the motions and

vibrations of will and passion, but it fails as soon as it tries to invade the domain of poetry. Its mission is to interpret the impulse of passion, not to describe persons or explain situations. This music, pure and simple, was brought by Beethoven to the highest pitch of perfection of which it was capable. He took the sonata and symphony as they had grown out of the small beginnings of dance music and filled them anew with ideal passion. The dramatic power with which Wagner describes the great composer, cut off by his deafness from all the world, and even from his own creations as embodied by sound, and yet rejoicing like a god in the midst of his works—a Tiresias who, blind himself, saw farther than all the world with their seeing eyes—is worthy of the author of *Tristan* and the *Valkyre*. And yet, as our author shows, Beethoven, in all the bliss of musical creation, betrays a longing for something of which he himself was scarcely aware, but which he descried with the unconscious divination of genius, and the marks of which are distinctly traceable in the works of his last and grandest period—a result which we know now to be something quite out of the reach of music proper, and attainable only by the union of its power with that of all the sister arts.

The possibility of this union Wagner explains thus. Music is connected with dancing by rhythm, which is common to both, and rhythm is also the foundation of the art of acting, which is only the highest and noblest kind of pantomime. Even in painting, sculpture, and architecture, the Greek philosophers discovered analogous principles. Antique poetry, both of the north and south, was entirely founded upon rhythm, and modern poetry retains traces of its origin. This connection, moreover, between music and poetry is the closer because poetry is intended to be pronounced by the human voice, which is at the same time one of the most perfect musical instruments. This view of the human voice, as merely or mainly an instrument of music, explains the subordinate position to which poetry was confined where it appeared as text to artistic music. In the Italian aria for instance which maintained an unlimited sway over the operatic stage and the concert-room of the last century, it is almost true to say that words were only put into the mouth of the singer as more convenient for him to pronounce and to remember than meaningless vowels. At most their meaning served to give the composer some slight indication whether to write a brilliant *allegro* or a sentimental *adagio*. Almost the same might be said of the whole libretto of an opera which had to be adapted entirely to musical purposes. Of course dramatic absurdities could not always be avoided where the words were to be written for the music rather than the music for the words. Even musicians, with a high dramatic faculty like Mozart, though they were led sometimes by the dramatic situation to effects of the greatest beauty, were too much accustomed to consider the opera from a merely musical point of view to restore the necessary equality between music and poetry, so as to give to the combination of them the harmony of a real work of art.

With the estimate which our author gives, in this connection, of the modern Italian and French opera, we are bound to say that we cannot entirely agree. Surely works of men like Verdi, Auber, and Meyerbeer, if compared with those of Bellini and Donizetti, exhibit an immense progress in the development of the deeper dramatic capabilities of music. Wagner himself, as a musician, has learned much from these writers, and seems to us to permit himself too severe, however natural, a judgment upon what to him now are the errors of his youth.

On the other hand it is of course true that so long as the opera is merely considered as an acted piece of music it can never fulfil the conditions of the drama.

To continue with Wagner: Beethoven himself felt this drawback in the musical stage of his time, and *Fidelio* remained the only opera he ever wrote. Even that with all its high dramatic qualities is after all scarcely anything but a grand symphony of instruments and human voices. For a reorganization of the drama from the poetical point of view Beethoven's musical powers were too predominant. But in another sense he was destined to originate "the poetry of music." He was the first who attempted to condense the vague feelings which were all that music had hitherto expressed into more distinctly intelligible ideas; he even brings the song of birds, the thunder, and the murmuring of the brook before the ear, less as a portrait of the face of nature, than as at once a suggestion and embodiment of the feelings which would be called up by them: "mehr Ausdruck der Empfindung als Malerei"—as he wrote himself at the head of his Pastoral Symphony. If we recall the simile between the composer's state in production and a dream, we might compare this phase of Beethoven's artistic career to the transition between waking and sleeping, where the senses as they revive supply the mind with images from the outer world, to clothe its dream which was naked and shapeless. Indeed there are passages in his later instrumental works such as long distinct *recitativi* which can only be explained by the presence of some occult idea striving for self-consciousness, or, if it may be, expression. None of the great opera composers before him had brought this dramatic quality of music to such a degree as Beethoven, not in his *Fidelio*, but in his orchestral works like the overture to *Coriolanus*, the conception of whose character is scarcely equalled by Shakespeare himself, or in the Ninth Symphony, which seems to be the sublime accompaniment to some immense drama, of which mankind itself, with all its doubts, pains, and joys, is the hero.

Wagner calls this symphony the last that has ever been written, and seems to deny a *raison d'être* to the symphonies by which Schubert, Mendelssohn, and Schumann have really enriched the literature of music. We are quite prepared to admit that any further development beyond and *in the same direction as* the Ninth Symphony, can be nothing else than the Music-Drama: still the emergence of a higher and more complex type does not render impossible or irrational the perpetuation and perfection of a lower and simpler species as such. This step to the Music-Drama Beethoven could not make, partly because his nature was too thoroughly musical to begin a reconstruction of his art on a poetical basis, partly because he never succeeded in finding a dramatic poem at once congenial and adapted to his own inspiration.

By a rare gift of nature Beethoven's great follower, Richard Wagner, is endowed in an eminent degree with both qualities, and in him at last we must recognise the reformer who reunites the two arts of drama and music, which seemed to be separated by a profound chasm, and in reality are one. For though music starts from a region quite aloof from the world of existence, whilst the drama grows out of the most real reality of life, yet they are necessary to each other as co-ordinate and complementary expressions of the infinite depth of human passion.

Theology.

The Book of Isaiah Chronologically Arranged. An amended version, with historical and critical Introductions and Explanatory Notes. By T. K. Cheyne, M.A., Fellow of Balliol College, Oxford. London: Macmillan.

Most of the prophecies in the Book of Isaiah owe their origin to the stimulus of warlike events, and can only be thoroughly understood in close connection with these. This fact alone is sufficient to show the importance of a chronological arrangement, such as our Masoretic text does not supply. Ewald long ago showed with great probability that the first part of our book was composed of smaller collections put together under the superintendence of the prophet Isaiah himself; and a similar proceeding on the part of Jeremiah is well known to be historically certain. But there are many other prophecies of Isaiah which were first collected by his companions and disciples, it may be long after his death; and the uncertain compass of the book procured acceptance for other oracles still, which were either held to be Isaiah's or at least sufficiently important to be worth preserving. But such an extension of the book into a kind of prophetic anthology was incompatible with the preservation of the kind of unity which we find in the Book of Jeremiah, or in Ezekiel's collection. It is probable also that later generations were influenced by the assumption that the greatest prophet must necessarily have left the greatest number of predictions, just as the pre-eminence of Moses was based upon the number (74) of his miracles. In addition to this, the connection of passages is often broken by the present division of the chapters, while utterances of different dates are joined together, so as to render the comprehension of the whole almost impossible; while the division into verses contributes largely to obscure the original grouping of the thoughts. Mr. Cheyne therefore deserves our gratitude for having furnished a correct chronological arrangement, as well as a translation corresponding to the real connection of the sense. He is moreover thoroughly acquainted with the latest researches upon Isaiah; a precise brevity characterises his way of stating a case, and his explanations of difficult passages are often original and convincing. Altogether the work is one which will enable English readers, for the first time, to form a correct idea not only of the works of the greatest of the prophets, but of all the best prophetic activity in the eighth century B.C., and at the end of the Babylonian captivity.

The introduction discusses Isaiah's prophetic career, his writings, and, at greater length, the question of the authorship of chaps. xl.-lxvi. Although these topics have all been debated times without number, we have here brought to light two or three essential points which have been nearly overlooked hitherto, in spite of their great importance. It is shown, *e.g.* that both in his style and his matter Isaiah was a trained, if not exactly a learned, prophet. Whatever influence oral instruction may have attained, it cannot have been of the same importance in Isaiah's time as it was in the later schools (or amongst the Brahmins); it must have rested for support upon the study of written prophecies, and upon the existence of a body of prophetic literature of which probably we have only scanty fragments remaining. Even as early as in Isaiah we can discern (as our author, following Ewald, rightly points out) traces of an endeavour to record, and, so to say, to publish, collections and summaries of the existing oracles. What we possess is only a series of "reproductions of the main outlines of his public teaching," often rearranged with a view to literary publication. This was not indeed denied by previous writers; but in determining the chronology of single prophecies the importance of the consideration had been insufficiently appreciated. Only in the case of the introductory vision (chap. vi.) had it been admitted that the date of the vision itself was much earlier than the publication, whether oral or written, of the prophecy, and that this last date was approximately fixed by circumstantial indications, the closer investigation of which has yet to be made. In the same way the real chronology of many other oracles has been obscured by the modifications attendant on their publication; and it is precisely this which makes it so difficult to determine *when* a given prophecy was first delivered. But as the first step towards overcoming a difficulty is to recognise its existence, the author has rendered a real service in calling attention to this side of the chronological problem. In section 3 seqq. the question whether chaps. xl.–lxvi. are Isaiah's is treated in a more definite and trenchant manner. The author states the grounds for a negative conclusion so clearly and forcibly that we can scarcely imagine an unprejudiced reader remaining unconvinced by them. In Germany, of course, adherence to the affirmative view has long ceased to be the Shibboleth of orthodoxy. The account of the characteristics of the five prophets of the Captivity whose fragments are contained in our book is also acute and penetrating, and in section 8 the value of the received text is estimated with learning and judgment.

On p. 32 the author gives a chronological table of events after Jules Oppert, according to which the expedition of Tiglath-pileser took place in 733, that of Sennacherib against Judah in 700, Shalmaneser's accession in 727, and his succession by Sargon in 722. In the work itself, however, Mr. Cheyne identifies Sargon and Shalmaneser, and places Sennacherib's campaign in 714, according to the common calculation. The fact is that the list seems either to offer too much or too little. It is well known that the common (Biblical) chronology of this period has been seriously called in question by both Assyriologists and Egyptologists. The introduction to a chronological arrangement of the prophecies of Isaiah ought surely to offer some solution of the difficulties of the case, and we should have thought that the clear and concise pen of the author was fully equal to the arduous undertaking. Mr. Sayce's valuable remarks in the supplementary notes at the end are not sufficient. It makes a difference whether Sennacherib's invasion is placed in the year 714 (or 713), or in 703 (or 700): if the last, it is evident that Isaiah did not collect the prophecies referring to this expedition himself (especially xxviii.-xxxiii.), and this explains their present position. The question of the identity of Sargon and Shalmaneser depends partly upon the proofs of Mr. Sayce's remarkable theory that the strokes in the Assyrian Fasti indicate chronological periods, instead of denoting, as most Assyriologists maintain, the accession of a new king—a problem which is certainly not yet ripe for decision. But though such an extension of the introduction would have been most welcome, the want of it does not materially affect the value of the results attained; the succession of the principal events is firmly established, and though, by the acceptance of the Assyrian chronology, single dates are displaced, and the

distance in time between the principal groups of Isaiah's prophecies enlarged, their *relative* date remains the same. It would have been well if in his list of the prophecies (p. 30) Mr. Cheyne had also marked the corresponding chapters in the Book of Isaiah.

As far as the chronology of single groups is concerned, we agree with almost all the author's conclusions. In spite of their brevity, his arguments have great cogency, and his analysis of the contents, though of less independent value, reproduces the sense and connection of the pieces with a force and beauty such as we seldom find in works of this kind, which are apt to make very little account of mere merits of style. It has been pointed out by Ewald, and no doubt rightly, that chap. v. 26–30 is a continuation of the passage ix. 8–x. 4. But whether this falls towards the latter part of Jotham's reign, or after the defeat of Rezin by Tiglath-pileser (that is 739 or 732), depends upon whether we translate *tzarê* (ix. 10) *oppressors*, or (with Mr. Cheyne) *warriors*, which seems to us rather bold. It would be preferable to suppose (with Ewald) an early and easily intelligible alteration from *ssarê* (princes), for there is no doubt that v. 11 refers to previous attacks of the Syrians and Philistines upon Israel. A division of chap. vi., making verses 1–8 to belong to an earlier and the conclusion to a later period, is rather hazardous: according to this the oracle in its first form would not have contained the substance of the message, only the prophetic commission itself. The author takes a safer view, p. 22, when he says, "Isaiah interpreted the doubts, which may even then have sobered his confidence, in the light of his subsequent experience." We agree with him entirely that the section vii. 1–ix. 7 was first written down under Hezekiah, since the words, "in the days of Ahaz," could not possibly have been written during the reign of that king. Chap. i. is considered, with great plausibility, as the prologue to a new edition, so to speak, of two collections. The desolation there depicted is supposed to have been due, not to Syria and Ephraim, but, according to 2 Chron. xxviii. 17, 18, to the Philistines and the Edomites. It seems doubtful, however, whether the first invasion and the last can be so distinctly opposed to each other, since the last only affected the south-west and south-east, not the north, of Judæa; besides which they were really contemporaneous. Mr. Cheyne says that the Syrian invasion was only directed against the dynasty; but this could only be dethroned after the people had been completely subdued and the land occupied. *Delirant reges, plectuntur Achivi.* After the loss of two great battles, it was only natural that the country should be overrun. Its total devastation was thus the work of four enemies, according to the very credible account given in Chronicles. The prophecy referring to Philistia (xiv. 28–32) is rightly placed earlier than the last year of Ahaz's life, and may well belong to a disciple of Isaiah. It is perfectly clear that chaps. xv. xvi. are the work of an older prophet than Isaiah, and are only repeated by him; whilst the refutation of Ewald's view, referring xvi. 1–6 to a third author, is quite satisfactory. But whether the oracle pronounced against Arabia, xxi. 13–17, went forth against Sargon or against Sennacherib, in either case it belongs to Hezekiah's time. Ewald's conjecture, *Kenaanim* for *Kasdim*, in xxiii. 13, is adopted by the author; it is true that the historical arguments against the latter are not absolutely decisive, but, on the other hand, the context seems to demand the change. To this must be added that the Masoretic lection undoubtedly mistook the word, and referred it to the ancient Canaanites instead of to the contemporary Phœnicians. We are not inclined to accept in such an unqualified manner the latter date of the conclusion.

While chap. xxviii. belongs to the first year of the siege of Samaria, chaps. xxix.–xxxii., as well as xxxiii., which the author discusses separately, refer to the march of Sennacherib. The passage x. 5–xii. 6 we should, with the author, prefer to place in 721 rather than 715, and it is not apparent why he does not treat it immediately after chap. xxviii. Chap. xx. belongs to the period when Egypt and Æthiopia were seeking the alliance of Judæa against Sennacherib. But the fall of Assur is certain (chap. xvii. 12, 14), and xxxiii. as well as xxxviii. 22–35, are the last words of the prophet in which he expresses this certainty. When, to conclude, the author assigns chap. xix., the prophecy upon Egypt, to the year 680, we feel the want of more detailed proof; and the case is one which calls for more exact researches into the confused field of Egyptian chronology.

Mr. Cheyne devotes five appendices to those prophecies which are not Isaiah's. They all belong to the Exile. Chaps. xxxiv. xxxv. were written at an early period while the bitterness against the Edomites still prevailed, but xxiv.–xxvii. begin to look forward to the fall of Babylon, and in both xxi. 1–10 and xiii. 1–xiv., 23, the Persians appear already in the neighbourhood of the capital. The last twenty-seven chapters are the work of the same prophet, divided into three books, all of which, however, were written during the Exile, though Bleek and others place the later ones only a short time after Cyrus's edict for the deliverance of the Jews. The author also opposes the view of Ewald and Bleek that lvi. 9–lvii. 11 is "a quotation from an earlier prophet who lived probably in the reign of Manasseh" (p. 201). His arguments are worthy of consideration, though the impression made by the passage itself has always inclined us to the view that former prophecies had, at least, been extensively used. Like all unprejudiced interpreters, Mr. Cheyne denies that in the phrase "servant of Jahveh" the prophet alluded to any single historical personage. His own theory is a modification of the view that the term is a collective one; it represents to him, as it were, "the Genius of Israel," *i. e.* that sublime religious ideal, which even the righteous part of the nation confessed (lxiv. 6 &c.) their inability to realise. In fact the question depends on this primary rule of interpretation, that an author in the same book, in the same strain of ideas, and using the same words, cannot be supposed suddenly to mean something quite different from what he meant by them before. This negative must be distinctly maintained so long as we believe in the possibility of exegesis; and it is just in the chapters (lii. liii.) where the personification is carried to the highest point that the epithets of the "servant of Jahveh" become the same as the most important of those which had been previously applied to the people of Israel.

The translation adheres as closely as possible in style and diction to the English authorised version; and as this is well known to be one of the best of popular translations, there are comparatively few alterations of serious importance. On the other hand, there are many trifling corrections, which are often very happy in bringing the real sense into clearer relief. The short explanatory notes which follow every section are also very valuable. The author is evidently a master of scientific exegesis, and though, especially in what concerns conjectural emendation, he follows Ewald by preference, he preserves his own independence of judgment throughout. Thus the notes satisfy the demand for "accurate information on the most important books of the Old Testament," whilst they are entirely free from a striving after cheap originality. Many of his explanations are so acute and exhaustive that we should recommend them strongly to the attention of professional scholars even when their substance is already familiar. To this number belongs the very satis-

factory explanation of El Gibbor, in ix. 6, which has been obscured by dogmatic prejudices, together with the sound remark: "The length of his name (viz. in two pairs of compound names) is to express, in Oriental manner, the dignity of its bearer." The same may be said of the explanation offered of the difficult phrase *b'rîth 'am* (covenant of the people," xlii. 6). The designation of Æthiopia as the "land of resounding wings" (xviii. 1) is also neatly explained in the note: "The prophet compares the tumult of the Æthiopian hosts to the buzz of swarms of insects" (p. 95; cf. *Notes and Criticisms*, p. 20), which supersedes all the "wild guesses" of ancient and modern interpreters. To these must naturally be added all the more important interpretations which the author had already discussed in his *Notes and Criticisms*. One word in conclusion on a "supplementary note," p. 237. We have always held that in i. 12, *leraoth panai* should be read *lir'ôth*, "to behold my face;" and the author's proofs are irresistible. In general all the forms, in which the punctators have assumed a contraction of the infinitive Hifil and especially of the Nifal, require thorough revision. We can thoroughly recommend Mr. Cheyne's translation and explanation of the Book of Isaiah, as a successful attempt to extend a right understanding of this important Old Testament writing. L. Diestel.

Selected Articles.

On Pascal's Provincial Letters, by Rev. H. J. Coleridge, in The Month, March.—[Exposes Pascal's misrepresentations of the Jesuits. It should have been noticed that the latest Protestant biographer of Pascal admits the influence of unfair motives upon his hero. See Dreydorff's Pascal, sein Leben u. seine Kämpfe, Leipz. 1870.]

On the late Professor Van Hengel, in Protestantische Kirchenzeitung, March 4.—[Prof. Van H. died last month at the age of 91. Surpassed by no German scholar in knowledge of Greek Testament idioms, he held the balance in his own University (Leyden) between the "orthodox" and the "liberal" parties.]

On the new edition of Tuch's Genesis, by H. E., in Gött. gel. Anz., Feb. 15.—[Chiefly against an essay by Merx on the progress of criticism. H. E. betrays some irritation at the rude shocks given by Graf and others to the comparative unanimity which till lately prevailed among critics. H. E.'s arguments are the well known ones of Prof. Ewald.]

On Schrader's edition of De Wette's Introd. to the Old Test., by Kamphausen, in Studien u. Kritiken, 1871, No. 2.—[Very thorough critique; admits the superiority of Schrader to the new edition of Bleek.]

On Hitzig's History of Israel, by Diestel, in Jahrb. für deutsche Theologie, 1871, No. 4.—[Discriminates wisely between the various degrees of probability in Hitzig's conjectures.]

Physical Science and Philosophy.

The Descent of Man and Selection in relation to Sex. By Charles Darwin, M.A., F.R.S., &c. In two volumes, with Illustrations. John Murray, 1871.

Mr. Darwin's reputation already stands so high that it may seem difficult to add to it. Yet this work will undoubtedly do so, and will prove almost equally attractive to the naturalist and the general reader. The two large volumes on *Domesticated Animals and Plants* caused some little disappointment to those who looked for easy scientific reading; but the present work will have no such drawback. It is throughout written in the author's clearest style, it is not overloaded with detail, it abounds in curious facts and acute reasoning, and it treats of two great subjects of the very highest interest—the nature and origin of man, and the overwhelming importance of sexual influences in moulding and beautifying the animal world.

The few passages devoted to sexual selection in the *Origin of Species*, led many persons to suppose that it was but a vague hypothesis almost unsupported by direct evidence; and most of its opponents have shown an utter ignorance of, or disbelief in, the whole matter. It will now be seen on what a solid foundation of fact the theory of sexual selection is founded, and how true, as regards this part of his subject at all events, was Mr. Darwin's assertion, that his first volume contained but a mere abstract of the evidence before him, and that he could not be properly judged till the whole mass of facts he had collected were made public. From the reticence with which the sexual relations of animals have been treated in popular works, most of the readers of this book will be astonished to find that a new and inner world of animal life exists, of which they had hitherto had no conception; and that a considerable portion of the form and structure, the weapons, the ornaments, and the colouring of animals, owes its very existence to the separation of the sexes. This new branch of natural history is one of the most striking creations of Mr. Darwin's genius, and it is all his own; and although we believe he imputes far too much to its operation, it must be admitted to have exerted a most powerful influence over the higher forms of life. In the first part of this article we propose to sketch in outline the main facts and arguments adduced, and shall afterwards discuss certain points which seem open to criticism.

Mr. Darwin tells us that he has for many years collected the materials on which this work is mainly founded, without any intention of publishing them, as he did not wish to prejudice the reception of the general doctrine of natural selection. That doctrine has, however, made such rapid and unexpected progress that no danger of this kind any longer exists; and he has therefore put together his materials relating to the origin of man from a lower animal form. Believing that sexual selection has played an important part in differentiating the races of man, he has found it necessary to treat this subject in great detail, which has much increased the bulk of the work.

The first chapter discusses the evidence for the descent of man from some lower form. Not only is man's whole structure comparable, bone by bone and muscle by muscle, with that of other vertebrata, but his close relation to them is shown in a variety of unexpected ways. He is able to receive some animal diseases, as glanders, hydrophobia, &c., showing a close similarity to other animals in blood and tissues. The internal and external parasites of man are of the same families and genera as those of the lower animals. The embryonic development of man is exactly similar to that of other vertebrates, so that at an early period his embryo can hardly be distinguished from theirs; and arteries running in arch-like branches as if to carry blood to branchiæ which are not present in the higher animals, show his affinity to the lower aquatic forms. A little later, the great toe is found standing out from the side of the foot, as it does in the quadrumana. Numerous rudiments occur in man of structures characteristic of lower forms. Many muscles

regularly present in apes and other quadrupeds occasionally appear in man. The upper part of the infolded lobe of the ear often presents a pointed projection, the rudiment of the pointed and erectile ears of most mammals. The supra-condyloid foramen, through which the great nerve of the fore limb passes in quadrumana and carnivora, is absent in man; but it occasionally reappears, with the nerve passing through it; and a careful examination of the remains of prehistoric races shows, that this form was more frequent in ancient times than now.

The mental powers of man are then compared with those of the lower animals, and it is shown that the latter possess the rudiments of them all. The origin of the moral sense is next treated of; and although such eminent writers as Mill, Bain, Herbert Spencer, and Sir John Lubbock, have all given their independent theories on this subject, Mr. Darwin has hit upon a perfectly original view, which is perhaps more satisfactory than any which have preceded it. He maintains that the moral sense arises from the social instincts combined with an active intellect. As soon as the mental faculties became well developed, images of past actions and motives would be incessantly passing through the mind of each individual, and a feeling of dissatisfaction would arise whenever it was perceived that the ever present social instinct had yielded to some other instinct stronger at the time but less enduring. For example, such instincts as hunger, lust, or the desire of vengeance, are immensely strong but are not enduring, and do not leave vivid and easily recalled impressions at all proportionate to their intensity at the time. The feeling of sympathy, the need of companionship, the desire for the approbation of our fellows are, on the other hand, ever present with us, and anything which interfered with these would be a constant source of dissatisfaction. If then a being with a sufficiently active mind to recall past actions and see the effects they have produced were, under the impulse of any of the stronger instincts, to rob, starve, kill or injure those who were necessary to the satisfaction of his social instincts, he would inevitably feel dissatisfied with himself at having allowed his passion for a temporary enjoyment, the force of which he could not realise afterwards, to interfere with the satisfaction of his less intense but more permanent desires and instincts. A repetition of such experiences would lead to the feeling that the one kind of instincts was less important to his welfare than the other. He would class them as passions to be regulated and controlled; and when in spite of his determination to control them he had not done so, he would almost despise himself — would feel remorse — would be rebuked by his conscience. Mr. Darwin shows at some length, that the rudiments of all these instincts and emotions exist in animals; and he argues that the acquisition of speech would greatly increase their power; for when each member of the community could express his feelings and wishes, the opinion of his fellows would go to increase the regret felt at having allowed the temporary to overcome the permanent instinct. The effect of this at first, would be to limit "virtue" to that which was for the benefit of the tribe exclusively. Murder, robbery, and treachery within the limits of the tribe would be infamous, but beyond these limits might be even praiseworthy. Thus infanticide is so often not looked upon as a crime, because it is supposed to be beneficial to the tribe; and no pity has been felt for the sufferings of enemies, of slaves, or even of women. Owing to its great utility to the tribe, courage is always looked upon as the highest virtue; and for the same reason fidelity and self-sacrifice are always highly esteemed. But intemperance and licentiousness are never counted as vices, because they do not immediately concern any one but the individual and his family. Mr. Darwin concludes, that the moral sense is fundamentally identical with the social instincts, and has been developed for the general good of the community, rather than for its greatest happiness. "General good" is defined as "the means by which the greatest possible number of individuals can be reared in full vigour and health, with all their faculties perfect under the conditions to which they are exposed;" and it is quite conceivable that this may not be always identical with "greatest happiness." If so, the present theory will be a step in advance in the history of the utilitarian philosophy.

The manner of development of man from some lower form is next very fully discussed. The extreme variability of every part of man's bodily structure and mental faculties is shown; the effect of changed conditions whether of locality or of habits is proved to be considerable; and arrested developments, reversions, and correlated variations are all shown to obtain in man exactly as they do in the lower animals. Natural selection must have acted on man, because he multiplies rapidly beyond the means of subsistence, because he varies, and because he is exposed to varying external conditions; but Mr. Darwin adopts the views of the present writer, that as soon as man's mind had become moderately developed, the action of natural selection would have been checked, as regards his general structure, and transferred to his mental faculties. It is argued that the advance from animal to man must have taken place before the dispersal of the race over the world; and that in some warm country as large as Australia, New Guinea, or Borneo, "the competition between tribe and tribe would have been sufficient under favourable conditions to have raised man through survival of the fittest, combined with the inherited effects of habit, to his present high position in the organic scale." A separate chapter is devoted to the development of man's intellect, and to the effects of natural selection on civilised nations; and though many of the arguments used are open to criticism, the subject is most interesting, and is discussed with Mr. Darwin's usual clearness and candour.

The next two chapters discuss,—the special affinities of man to certain lower animals, by means of which the line of his genealogy can be traced, and the place and time of his origin approximately determined,—and the nature and probable origin of the several races of man. This last he believes cannot be fully explained without the agency of sexual selection, and this leads to the second part of the work, which treats of sexual differences, their causes and effects, throughout the animal kingdom, in order that the principles deduced from this extensive survey may be applied to explain certain residual phenomena in man.

The subject of sexual selection, occupying nearly five hundred pages, is treated in great detail, and abounds in matter of interest; but only a very brief sketch can here be given of it. The main theory depends upon the fact that there is almost invariably a struggle among the males for the females; a struggle carried on either by actual fighting or by rivalry in voice or in beauty. This struggle is moreover ensured by the circumstance that in most cases the males are ready to breed before the females, male insects emerging sooner from the pupa, and male migratory birds arriving earlier than those of the other sex. From this it results that some males gain the victory over others, and succeed in pairing earlier and with the earliest and most vigorous females. The males are always the most eager, the females generally coy; and Mr. Darwin believes that in almost all cases the female exerts a choice, and rejects those males who please her least. Hence have arisen two sets of modi-

fications in male animals: 1. Weapons of various kinds have been developed, owing to those best able to fight having most frequently left progeny to inherit their superiority; 2. Musical organs, bright colours, or ornamental appendages, have been developed, through the females preferring those so gifted or adorned. The laws of inheritance are first discussed; the transmission of characters to the male alone through the female, and the transmission of variations at certain ages to the offspring at the same age, and to one or both sexes. A large portion of the animal kingdom is then passed in review, as respects the differentiation of the sexes and the means by which such differentiation has been produced. This part of the work is illustrated by numerous woodcuts, showing the extraordinary differences of form and structure between the sexes. Many parts of the body have been modified to enable the male to seize and hold the female; and this is adduced as an argument that the female exerts a choice, and has the power of rejecting any particular male. But this hardly seems to follow, for it may well be maintained that when the more active male seizes a female, she cannot escape, and that she has no means of rejecting him and practically never does so.

The males of a considerable number of homopterous and orthopterous insects emit musical sounds by means of very curious and varied apparatus, and there is no doubt that these sounds serve to attract or charm the female. Among most insects the males fight, but neither spiders nor dragonflies have been observed to do so. Among all other insects than lepidoptera, the sexes are as a rule coloured alike or nearly alike, the exceptions being comparatively few; but among butterflies especially, diversity of colour is the rule, the males being almost always most brilliantly or most intensely coloured; and the difference is often so great that the two sexes look like widely different species. Beetles differ more in form than in colour, the males often possessing wonderful horns, spines, or protuberances, immensely long legs or antennæ, or enormous jaws, while in colour they hardly differ at all or are only somewhat brighter. Passing on to the vertebrates, we find that male fishes often fight, and exhibit as much ardour as terrestrial animals; some of them undergo strange changes of form at the breeding season, and some few differ conspicuously from the females in colour, or by the possession of elongated fins, spines, or other appendages. In other cases, although the sexes are usually alike, yet in the breeding season the males acquire new or more vivid colours.

Passing by amphibians and reptiles, among which many curious sexual characters occur, we come to birds, a class which exhibits them in their highest perfection, and which has furnished Mr. Darwin with the most powerful arguments for the complete development of his theory of sexual selection. Almost every imaginable kind of sexual ornament is here to be found. In an immense number of cases male birds are far more beautifully coloured than the females; and besides this, they often possess the most gorgeous developments of ornamental plumage, as in the train of the peacock, the wings of the African night-jar, the tail of the lyre-bird and of the resplendent trogon, the crest of the umbrella-bird, and the breast plumes of the bird-of-paradise. Spurs are also developed upon the legs or the wings, and the male is generally larger, and has a louder or more melodious voice. Among birds is found the first direct proof that the female notices and admires increased brilliancy or beauty of colour, or any novel ornament; and, what is more important, that she exercises choice, rejecting one suitor and choosing another. There is abundant evidence too that the male fully displays all his charms before the females, and some of the facts adduced on this head are most curious and interesting. Mr. Darwin also devotes himself to showing how some of the most marvellous developments of beauty in plumage may have been produced by the constant selection of slight modifications; and he explains in this manner the origin of the eyed train of the peacock, and the wonderfully decorated wings of the Argus pheasant, with an acuteness and success hardly inferior to that which he exhibited when investigating the structure of coral reefs or of orchids. The four chapters on birds would alone demand a lengthy article to do them justice, but as we shall have to return to this subject when we come to criticise some portion of the theory, it will be as well now to pass over the two chapters on the sexual differences and weapons of the mammalia, and devote some little space to a sketch of the concluding chapters, which again treat of man.

The sexual differences of man are stated to be greater than in most species of quadrumana, while in their general features and mode of development man agrees remarkably with those animals, as an example of which we may quote, that whenever the beard differs in colour from the hair on the head, it is always lighter, both in man and monkeys. The law of battle for wives still prevails among some savages, and to this circumstance Mr. Darwin thinks may be traced the undoubted inferiority of woman, not only in bodily strength but also in courage and perseverance, qualities equally necessary to ensure victory. He thinks also that but for the fortunate circumstance that the law of equal transmission of characters to both sexes has commonly prevailed among mammalia, man might have become as much superior to woman in mind as the peacock surpasses the peahen in plumage. Considerable space is devoted to prove that savages think much of personal appearance, admire certain types of form and complexion, and that probably selection of wives and husbands has been an important agent in determining both the racial and the sexual differences of mankind. The evidence adduced, however, seems only to show that the men as a rule ornament themselves more than the women, and that they do so to be admired by their fellow-men quite as much as by the women; and also that men of each race admire all the characteristic features of their own race, and abhor any wide departure from it; the natural effect of which would be to keep the race true, not to favour the production of new races. It is admitted that promiscuous intercourse and infanticide would to a great extent prevent the action of sexual selection; but it would also be rendered nugatory by the fact that among savages no woman remains unmarried, youth and health being amply sufficient charms to procure her a husband. It also seems very uncertain whether any effect would be produced by the more powerful men possessing themselves of a number of the most beautiful women, and rearing on an average a greater number of children, as Mr. Darwin thinks they would do. Where polygamy prevails the number of children to one father may be very large, but will the number to each mother be as large as with the remainder of the tribe who are forced to practise monogamy? This important point is not alluded to. The absence of hair on the body is admitted to be a character that cannot be accounted for by "natural selection," because it cannot be conceived to have been a beneficial variation; but "sexual selection" is supposed to account for it. At an exceedingly early period in our history our semi-human ancestors were hairy, and it is thought that one or both sexes preferred less hair; and any partial nudity that appeared led to a more early or a more constant wedlock, and thus gave an advantage to such individuals and

their more numerous progeny. The example of monkeys and apes is adduced, many of which have bare skin on the face or on other parts of the body; and the New Zealand proverb, "There is no woman for a hairy man," is thought to bear upon the question. This explanation is by no means satisfactory. The analogy of the quadrumana and of other animals would have some force if there were still hairy and hairless or partially hairless men,—with bare faces and breasts, but hairy backs, for example; but we have to deal with a complete nudity, which has no parallel in the animal kingdom except in cases where "natural selection" has evidently come into play. That a smooth-skinned race like the New Zealanders should object to hairiness is natural; for, as Mr. Darwin says, each race admires its own characteristics carried to a moderate extreme. Hairy races would therefore admire abundant hairiness, just as bearded races now admire fine beards; and any admiration of deficient hairiness would probably be as rare and abnormal as the admiration for partial baldness or scanty hair in women, would be among ourselves. Any individual fancy for such an abnormal peculiarity as deficient hair in a hair-covered animal could produce no effect; and that any such fancy should become general with our semi-human ancestors, and so produce universal nakedness, does not seem at all probable, when we have no evidence of such a result of sexual selection elsewhere in the whole animal kingdom. It is true, that in that early state the struggle for existence would have been severe, and only the best endowed would have survived; but unless we suppose a universal and simultaneous fancy among all the most vigorous and therefore probably the most hairy men for what would be then an unnatural character—deficiency of hair in women—and that this fancy should have persisted in all its force for a long series of generations, it is not easy to see how this severe struggle for existence and survival of the fittest would in any way aid sexual selection in abolishing the hairy covering. On the contrary it seems more likely that it would entirely prevent it. We can hardly therefore impute much influence to sexual selection in the case of man, even as regards less important characters than the loss of hair, because it requires the very same tastes to persist in the majority of the race during a period of long and unknown duration. All analogy teaches us that there would be no such identity of taste in successive generations; and this seems a fatal objection to the belief that any fixed and definite characters could have been produced in man by sexual selection alone.

In his last chapter, Mr. Darwin gives an able summary of the whole argument; and, while regretting that the result he has arrived at will be highly distasteful to many persons, maintains, that the whole evidence leads to the conclusion that man, notwithstanding his noble qualities and his godlike intellect, still bears in his bodily frame the indelible stamp of his lowly origin.

Having thus sketched in outline the theories advanced by our author, and given a summary of the facts by which he supports them, we have now to notice in more detail certain portions of the argument which appear to rest upon an insecure foundation either of logic or of fact.

The first and most obvious objection that will be made to this great work is, that it consists of two books mixed together. The whole of the matter relating to sexual selection among animals, would have formed a fitting third volume in the series of works treating in detail of the origin of species; while the part which treats of man, is an application of those principles to the human race which had hitherto only been discussed as regards other animals and plants, and would have formed a fitting companion volume to the *Origin of Species*. This rearrangement could easily be effected in a future edition, and would have many advantages; and should a similar suggestion come from other quarters we hope Mr. Darwin will adopt it.

In entering upon a criticism of some portions of these volumes, I am compelled to touch upon certain topics on which I hold, and have published, views differing considerably from those maintained by Mr. Darwin; and I am glad to have this opportunity of showing to what extent a study of his facts and arguments have modified my opinions. Before plunging into the intricate subject of "sexual selection," I must, however, make a few remarks on Mr. Darwin's use of the same term "instinct" for what seem to me very distinct things. He classes as instincts, hunger, self-preservation, the mother's love of her offspring, and the infant's power of sucking. The first is a sensation, the second acquired habit, the third an emotion, the fourth a pleasurable exercise of certain muscles—none of them instinct in the same sense as the cause of the migration of birds, of the building of platforms by apes, of the avoidance of poisonous fruits or the dread of snakes—all of which are specially mentioned as instincts. To go into the question of which of these latter are acquired habits or acquired knowledge, and which are truly instinctive, would lead us too far; but it is certainly not in accordance with our author's usual precision of language on other topics, to use the same term for a simple sensation like hunger—for a faculty which may be experience or may be simple dislike acquired by natural selection, like the avoidance of poisonous fruits—and for all the mental processes involved in a highly complex operation like that of the construction of a bird's nest. It is no doubt mainly due to the poverty of our language that one word has been used for so many distinct things; but as long as this is the case it is hardly possible to avoid confusion of ideas about instinct.

In discussing the subject of sexual selection it would perhaps have been a more convenient, even if a less scientific arrangement, to have treated first of those groups in which the evidence is clearest and most decisive; for Mr. Darwin is often obliged to refer to these in advance to strengthen his argument in the case of those inferior groups in which it is much more difficult to obtain evidence. I shall therefore first consider what is proved in the case of birds.

In birds sexual differences are both more generally the rule and more wonderfully varied in character than in any other class of animals. The males sometimes possess special weapons for fighting together; more frequently they charm the female by vocal or instrumental music; more frequently still they are ornamented with all sorts of crests, wattles, horns, air-sacs, plumes, and lengthened feathers springing from all parts of the body. They are extremely pugnacious; they sing in rivalry, and they perform the most extraordinary antics and dances during the breeding season, exhibiting in the most curious and often unexpected manner all their peculiar adornments before the female. It is proved that in many cases they have a taste for colour and for novelty; and some female domestic birds are shown to have had such a fondness for a peculiarly coloured male as to refuse to pair with any other. When in addition to this we consider that many birds are polygamous, and that in these the sexual differences are almost always greatest, we must admit that sexual selection would necessarily produce an effect in developing weapons, musical organs, or ornaments in one or both sexes. But while sexual selection has thus been doing its work, the still more powerful agency of natural selection has not been in abeyance, but has also modified one or both sexes in accordance with their conditions of life; and these in the case of birds are somewhat different in the two sexes. Whole groups of birds are evidently coloured for protection, resembling the desert sands, or the green leaves, or the

arctic snows, among which they live; and as we may be sure that variations tending to other colours have appeared in these birds, and as we have no reason to believe that in these groups only the females have been indifferent to such adornment, we must admit that natural selection has here checked the action of sexual selection. There are, however, an immense number of birds in which the female only is of dull brown or green tints, while the male is adorned with the most splendid colours; and there are also a very large number in which both sexes are equally or almost equally brilliant; and, with very rare exceptions, the rule is found to hold that the former class all build open nests, the latter all covered or hidden nests. The bright-coloured female birds are thus concealed while incubating, the dull-coloured are exposed. This very curious relation appeared to me to indicate that natural selection had been more powerful than the laws, whatever they are, which primarily determine the colours of birds; that the females had in one case been prevented from acquiring any considerable portion of the gay colouring of the males because it was hurtful to them, and in the other case had acquired it because, being concealed during incubation, it was no more hurtful to them than to the males. Mr. Darwin objects to this explanation of the facts. He maintains that the "laws of inheritance" determine whether colour or any other ornament appearing in one sex shall be transmitted to that sex only or to both. So far there is nothing to object to. But he goes further, and maintains that this tendency cannot be affected by natural selection, and that if a particular colour-variation begins to be transmitted to both sexes, the mode of transmission cannot, by natural selection, be changed, so that the colour may continue to be transmitted to the male to whom it is useful, but cease to be transmitted to the female to whom it is hurtful. Mr. Darwin admits that the law itself varies very frequently; for he gives numerous instances in which the different species of a genus exhibit all the possible modes of transmission, and as these have all descended from a common ancestor, the law has varied somewhat rapidly. He also says, "The equal transmission of characters to both sexes is the commonest form of inheritance," and we may therefore fairly assume that before diversity arose between the sexes it was the rule for both sexes to vary together. But he believes that, under these circumstances, it would be exceedingly difficult for natural selection to change the male alone, and he gives an imaginary illustration to exhibit this difficulty. He supposes a fancier to wish to make a breed of pigeons in which the males should be pale blue, the females remaining the usual slaty colour; and he says, "All that he could do would be to persevere in selecting every male pigeon which was in the least degree of a paler blue," and to match these with slaty females, the result being, of course, "either a mongrel piebald lot, or more probably the speedy and complete loss of the pale blue colour." But the supposed fancier has here gone quite the wrong way to work. His primary want is, not "blue males," but a breed in which there is a tendency to *differentiation of sex*. His proper plan, therefore, would be to look over as many sets as possible of the progeny of single pairs of pigeons till he found one in which a *differentiation of sex appeared in the right direction*, the males being lighter, the females darker, in however slight a degree. Breeding from these again, he would probably in a few generations find a greater differentiation occur, for we know that such changes in the mode of transmission have often occurred in nature; and only when he had obtained a breed in which the sexes were strongly differentiated, variations of colour occurring frequently in the male sex, rarely or not at all in the female, would it be advisable for him to begin selecting for the exact tint of colour he desired in his males. Now, though nature may often do more in the way of selection than man, we can hardly believe that anything can be done by man's selection which may not be done as effectually by natural selection; and as it is admitted that the dull colours of the females sitting on open nests are a protection to them, and also that variations in the mode of transmission frequently occur, what is to prevent the females being modified in the way most advantageous to them for protection, while the males are being modified in the way most advantageous to them, by sexual selection? When the males of a species began to gain bright colours by sexual selection, and these colours were transmitted to the females till they became injurious, it may be fairly assumed that they would be transmitted in somewhat varying degrees, for Mr. Darwin states (p. 177, vol.ii.), that the degree of limitation differs in species of the same group; and as from mere association in the same locality individuals of the same family have a good chance of breeding together, the less brilliant females and more brilliant males of such families would often produce offspring in which the sexual differences were still greater, and these would have the best chance of surviving again to leave offspring. It is true that brilliant males of the same stock with brilliant females would have an equal chance of leaving descendants, but as the females of their families would be at a great disadvantage and would less frequently rear offspring, while the females of the differentiated families would be protected, the latter would soon be in a majority of two to one, and must inevitably supplant the former. This view enables us to understand many facts given by Mr. Darwin which seem difficulties on his own hypothesis. Thus the sexes of Culicidæ and Tabanidæ among flies, differ in the structure of the mouth in accordance with difference of habits; some male Cirrhipedes have lost almost all their external organs, while the female has retained hers; and female glow-worms, as well as many female moths, have lost their wings. Such varied adaptations of one sex alone could only occur if the rule were almost universal, that variations were limited to the sex in which they originally appeared; but we have seen that the contrary is nearer to the truth, and it seems more probable that the phenomenon of strictly limited sexual transmission was actually produced by natural selection as soon as the need arose for a differentiation of the sexes in organization, habits, or economy, than that it is an independent law. It evidently could have been so produced as well as the primary separation of the sexes which Mr. Darwin does not seem to doubt was effected by means of natural selection; and he appears to be unnecessarily depreciating the efficacy of his own first principle when he places limited sexual transmission beyond the range of its power.

Passing now to the lower animals—fishes, and especially insects—the evidence for sexual selection becomes comparatively very weak; and it seems doubtful if we are justified in applying the laws which prevail among the highly organized and emotional birds, to interpret somewhat analogous results in their case. The rivalry between males, either by fighting together or by emitting attractive sounds or odours, undoubtedly acts in the case of insects as well as in the higher animals; but it is quite different with the other form of sexual selection. This depends upon the appreciation of slight differences of colour by the female, and also by her having the power as well as the will to reject such males as are slightly inferior in attractions; and on both these points there is no direct evidence but what tells against Mr. Darwin's view. Thus, he informs us that "fresh females are often found paired with battered, faded, or dingy males," and breeders agree that in the case of the various silk-moths the female exerts no choice whatever, Dr. Wallace of Col-

chester stating that he frequently finds the most vigorous females of *Bombyx Cynthia* paired with stunted males. But the Bombyces are among the most elegantly coloured of all moths.

From the fact that many male butterflies may be seen pursuing or crowding round the same female, Mr. Darwin concludes that the females prefer one male to another, because, if this were not the case, the pairing must be left to mere chance, and this does not seem to him a probable event. But surely the male who finally obtains the female will be either the most vigorous, or the strongest-winged, or the most patient of the two or three suitors—the one who tires out or beats off the rest. The pairing therefore will not be left to chance, and it is probably by such struggles that the males of almost all butterflies have been rendered much stronger-winged than the females. Throughout the whole of the other orders of insects there is no direct evidence whatever of sexual selection as regards colour; for the colours are generally similar in both sexes, and the particular colours that occur seem to be often determined by the greater or less need of protection. Thus the stinging Hymenoptera are, as a rule, conspicuously coloured; as are large numbers of the Hemiptera, which are protected by their disgusting odour. Coleoptera are almost all palpably protected, either by resembling inanimate objects, by obscurity, by hard coats of mail, or by being distasteful to birds; and those of the two latter categories are almost all conspicuously coloured. It seems to me therefore, much more probable that the colours of insects are due to the same unknown laws which have produced the colours of caterpillars, than that they are due to sexual selection. In caterpillars we have almost all the classes of coloration found in perfect insects. We have protective and conspicuous tints; and among the latter we have spots, streaks, bands, and patterns, perfectly definite in character and of the most brilliantly contrasted hues. We have also many ornamental appendages; beautiful fleshy tubercles or tentacles, hard spines, beautifully coloured hairs arranged in tufts, brushes, starry clusters, or long pencils,—and horns on the head and tail, either single or double, pointed or clubbed. Now if all these beautiful and varied ornaments can be produced and rendered constant in each species, by some unknown cause quite independent of sexual selection, why cannot the same cause produce the colours and many of the ornaments of perfect insects, subjected as they are to so much greater variety of conditions than their larvæ? In the case of butterflies it is a curious fact that the females are often much more variable than the males. The females of *Papilio memnon* and *Diadema auge* are perhaps the most variable of all butterflies, consisting of scores of such different insects that they have over and over again been described as distinct species, while in both cases the males are very constant. Had the males been differentiated by sexual selection we should have expected them to be more variable, as they always are among insects as regards largely developed jaws, horns, or other weapons undoubtedly used for sexual purposes. In many groups of butterflies too, the males of the different species of a genus closely resemble each other, while the females differ considerably, so that it often happens that forms considered to be mere varieties as long as the males only are known, become recognised as good species when the females are discovered. This is the case generally in *Ornithoptera*, several groups of *Papilio, Adolias, Diadema;* and it is so exactly the reverse of what obtains in birds that we must hesitate to apply the same explanation to the two sets of phenomena.

There are two other difficulties in the way of accepting Mr. Darwin's wide generalization as to the agency of sexual selection in producing the greater part of the colour that adorns the animal world. How are we to believe that the action of an ever varying fancy for any slight change of colour could produce and fix the definite colours and markings which actually characterize species. Successive generations of female birds choosing any little variety of colour that occurred among their suitors would necessarily lead to a speckled or piebald and unstable result, not to the beautifully definite colours and markings we see. To the agency of natural selection there is no such bar. Each variation is unerringly selected or rejected according as it is useful or the reverse; and as conditions change but slowly, modifications will necessarily be carried on and accumulated till they reach their highest point of efficiency. But how can the individual tastes of hundreds of successive generations of female birds produce any such definite or constant effect? Some law of necessary development of colour in certain parts of the body and in certain hues is first required, and then perhaps, in the case of birds, the females might choose the successive improvements as they occurred; though, unless other variations were altogether prevented, it seems just as likely that they would mar the effect the law of development of colour was tending to produce.

The other objection is, that there are signs of such a tendency, which, taken in connection with the cases of caterpillars, of shells, and other very low organisms, may cover the whole ground in the case of insects, and render sexual selection of colour as unnecessary as it is unsupported by direct evidence. In many islands of the Malay Archipelago, species of widely different genera of butterflies differ, in precisely the same way as to colour or form, from allied species in other islands. The same thing occurs to a less degree in other parts of the world. Here we have indications of some local modifying influence which is certainly not sexual selection. So, the production in the males only of certain butterflies, of a peculiar neuration of the wings, of differently formed legs, and especially of groups of peculiarly formed scales only to be detected by microscopical examination, indicate the existence of some laws of development capable of differentiating the sexes other than sexual selection.

On the whole then it seems to me, that the kind of sexual selection which depends on the female preferring certain colours or ornaments in the male, has not been proved to exist in insects. Their colours are probably due to some as yet unknown causes; the differences of the sexes consisting, partly of a greater intensity of colouring in the male, due perhaps to his smaller size and greater vigour, and partly of more or less protective tints acquired by the female alone on account of her slower flight and greater need for protection while depositing her eggs. Many other points of great interest must be passed over, but sufficient has been said to enable the reader fairly to compare the facts and arguments previously adduced by myself with those now set forth by Mr. Darwin, and to form a judgment as to the comparative importance to be attached to sexual selection and the need of protection, in determining the sexual differences of colour in animals.

Having in the first part of this article made some objections to the theory of sexual selection in its application to man, I will now briefly notice Mr. Darwin's account of the probable mode in which man became developed from his brute ancestor. All the evidence goes to show, that the change from brute to man took place in some limited area, probably tropical. Here he lost his hairy covering, acquired his erect form and his wonderful brain, and became so far advanced in the arts and in morals that natural selection ceased to act upon his mere bodily organization. It is also probable that he learnt to speak language, discovered the use of fire,

and perhaps even of canoes, before he spread over the earth, and before the several races of man were differentiated. The agency through which this vast transformation occurred was the struggle for existence and natural selection—a struggle first with other animals, and when they were surpassed between tribe and tribe; and this alone Mr. Darwin thinks would, under favourable conditions, raise man to his present high position in the organic scale.

In this view there are many difficulties. How is it possible to conceive, that during the enormous interval required to change a quadrumanous, hairy, speechless animal, into erect, smooth-skinned, large-brained, fire-using man, while the struggle for existence was most severe (for by the severity of the struggle alone he was raised), he yet never spread over the earth but remained concentrated in a limited area. Had he spread widely during the process of modification, divergence of character would inevitably have occurred, and we should have had several distinct species of man. Mr. Darwin argues that the fact of man, even at his lowest stage of civilisation and intellect, being able to maintain himself, surrounded by the most powerful and ferocious animals, is due to his large brain, which is thus of the most essential use to him. But almost all herbivorous animals also maintain themselves under similar conditions, with no special endowment of brains; and in South America the apparently helpless and almost idiotic sloth is not exterminated, though exposed to the attacks of pumas, tiger-cats, and harpy-eagles. Man could have acquired very little of his superiority to animals by a struggle with animals. "Natural selection does not produce absolute perfection but only relative perfection." We have to fall back therefore on the struggle with his fellows—family with family, tribe with tribe. But for this to be at all effectual, one of the most essential conditions is a large population inhabiting an extensive area, and this the conditions of the problem deny to us. The vast amount of the superiority of man to his nearest allies is what is so difficult to account for. His absolute erectness of posture, the completeness of his nudity, the harmonious perfection of his hands, the almost infinite capacities of his brain, constitute a series of correlated advances too great to be accounted for by the struggle for existence of an isolated group of apes in a limited area. And Mr. Darwin himself gives hints of unknown causes which may have aided in the work. He says: "An unexplained residuum of change, perhaps a large one, must be left to the assumed uniform action of those unknown agencies which occasionally induce strongly marked and abrupt deviations of structure in our domestic productions." And again: "If these causes, whatever they may be, were to act more uniformly and energetically during a lengthened period (and no reason can be assigned why this should not sometimes occur), the result would probably be, not mere slight differences, but well marked, constant modifications."

In concluding this very imperfect account of one of the most remarkable works in the English language, it may be affirmed, that Mr. Darwin has all but demonstrated the origin of man by descent from some inferior animal form—that he has proved the vast importance of sexual influences in modifying the colours and the structure of the more highly organized animals—and that he has thrown fresh light upon the intricate question of the mode of development of the moral and intellectual nature of man. Yet it must be admitted that there are many difficulties in the detailed application of his views; and it seems probable that these can only be overcome by giving more weight to those unknown laws whose existence he admits, but to which he assigns an altogether subordinate part in determining the development of organic forms. ALFRED R. WALLACE.

Philosophy.

The Nature and Origin of Moral Ideas.—Sir A. Grant's paper in the last number of the *Fortnightly* on this subject has the radical defect that—if we may use the peculiar dialect of Sir W. Hamilton—"it evacuates the phenomenon explained of all in it which desiderates explanation." In the first place, Sir A. Grant does not attempt to explain the origin of particular moral notions or principles, but only of the "blank formula of conscience," the general sense of duty, which he regards as the only eternal and immutable element in morality. We do not quarrel with this limitation of the enquiry in itself: but it has led him to ignore an essential element in the "form of duty," viz. the universality of application which the moral faculty at any rate *claims* for its decisions. No moral imperative is felt to be addressed to the individual only who is conscious of it, but to all persons in similar circumstances: however little others may recognise its validity. The sense of duty thus completely individualised in its import is explained to be really self-love or "the desire of self-preservation transformed into the desire of self-approval." It seems confusing to apply the same term to two desires so distinct, even granting that the latter is a metamorphosis of the former: however, the important point is to learn how this notion of *approval*, implying, as it does, conformity to rule or standard, is introduced. How is it that "self-regard takes the form of self-respect?" Strange to say this is just what Sir A. Grant does not see the need of explaining. He assumes man to possess free choice of actions, and tells us that repetition of the act of choice generates the feeling of admiration or approval towards the action chosen: not seeing that the whole difficulty lies in accounting for the peculiar characteristics which distinguish each of these feelings from simple preference and from each other. Whether self-consciousness is, or is not, as prominent as Sir A. Grant takes it to be in all stages of the evolution of moral sentiments, seems a matter of very subordinate importance. It may be added that the views of two well-known moralists, Butler and Kant, are strangely misrepresented in this paper.

Physiology.

Aphasia.—An interesting summary of what is known on this subject and some important observations on cases which have come under his own cognisance are given by Dr. Alex. Robertson, in the *Glasgow Medical Journal*, February 1871. Though much has been written on this subject the results are not very satisfactory, since aphasia proper has often been confounded with defective articulation and amnesia. Dr. Robertson carefully defines aphasia. Patients suffering from aphasia are unable to communicate their thoughts by words and possibly by any form of language whatever, although their intelligence is not greatly impaired. Prof. Trousseau believed that in aphasia there was not only a loss of speech, but an impairing of the understanding, "The patient does not speak because he does not remember the words which express ideas." This conclusion Dr. Robertson shows, from observations on two cases under him in 1866, to be incorrect. He was told by a patient, who had recovered from aphasia, that during her illness she knew quite well what to say, the words were in her mind, but she could not utter them. In amnesia words do not occur to a patient spontaneously, but he can repeat them immediately after hearing them or seeing them in print. This morbid condition is associated with great enfeeblement of mind, which in some cases is so severe that a single sentence forms the whole stock of a patient's language, and is given as an answer to all questions. Two rare forms of this disease are known: Agraphia, in which the patient speaks but blunders sadly in writing, and aphemia, in which he writes but cannot speak. There are curious cases on record in which a person could remember only the initial letter of words, and others in which all the words were ended alike. Mr. Darwin, in his new work, *The Descent of Man*, p. 58, speaks of cases in which the power to remember substantives is lost, whilst other words can be correctly used. It will be remembered that in 1865 M. Broca made the startling communication to the French Academy of Medicine that there existed a distinct faculty of language, which was localized in one small portion of the brain, viz. the posterior half of the lower left frontal convolution. To this conclusion he was led by observing that in several cases of aphasia which came under his notice this particular spot in the brain was atrophied or injured by disease. Subsequent observation has left it very doubtful whether the atrophy of a particular spot of the brain is, as a rule, the concomitant of aphasia. The result of Dr. Robertson's examination of four cases which he records is in favour of the conclusion that aphasia is accompanied by an atrophy of the fore part of the left hemisphere of the brain; he considers, however, that further observations on the subject are still necessary to determine this point. He believes not that any faculty of language exists in this spot, but that it simply contains the conductors by means of which the expression of language is accomplished. He

suggests that the apparent difference between the functions of the two hemispheres may be due to differences in the distribution of the minute blood-vessels in them.

The Nature of the Spleen.—Dr. Silvester of Clapham has published a little brochure, in which he endeavours to show, from various considerations, that the spleen is not the undeveloped liver of the left side of the body, nor the parenclyma of the liver disunited from the pancreas, nor a blood gland in the mesial line of the body, having no homologous relationship with the liver. It is, on the other hand, to be regarded as a sanguiferous gland, situated on the left side of the abdominal cavity, and as being the left-lateral homologue of a portion of the liver—the liver being a combination of a sanguiferous gland and a biliary apparatus. Dr. Silvester considers that the intestinal canal is mesial and symmetrical as far as to the stomach; but that this organ, together with the whole of the small intestine, is only developed on the right side of the body. The large intestine, again, like the commencement of the alimentary canal, is mesial and symmetrical. The only indication of a left small intestine is afforded by the vermiform appendix of the cæcum; if this were continuous, by means of a convoluted canal, with the cardiac extremity of the stomach, the whole alimentary canal would be symmetrical. He shows, ingeniously, how the absence of the left small intestine explains the existence of numerous anomalous arrangements, that cannot otherwise be accounted for—as the circumstance of the small intestine receiving only one artery from the aorta, the singleness of the umbilical vein, the asymmetry of Peyer's patches, &c. The liver he holds to be a compound gland, formed of a bile-secreting and a blood-making portion, of which the biliary portion being required for digestion is developed on the right side only: on the left, as the intestinal tract is undeveloped, there is no bile-secreting organ, but the blood-making portion appears in the form of the spleen.

Lymph-spaces of the Cornea.—In Stricker's *Medizinische Jahrbücher*, Heft 1, is an interesting paper by Dr. Genersich, of Pesth, on the above subject. When the cornea is treated with nitrate of silver there are seen in it, when viewed under the microscope, certain irregularly stellate bodies with long anastomosing processes which appear light on a dark ground. These are called by Recklinghausen Saftkanälchen, and are considered by him to be spaces from which the lymphatic canals of the cornea take origin. This interpretation of the phenomenon has been doubted by many observers, and especially more recently by Schweigger Seidel, who considers these silver images to be entirely post mortem products due to the action of the reagents employed in preparation. Dr. Genersich's observations tend to confirm Recklinghausen's views. He first inflamed the cornea and found that the Saftkanälchen shortened their processes and became rounder, behaved in fact very much like the connective tissue corpuscles in Stricker's well known observations. The fact that they thus alter their form under the influence of inflammation he holds to be an argument against the silver images being artificial products. He next took corneæ intensely stained with silver and placed them in the lymph sacs of living frogs. After five or six days they were taken out and examined with a Hartnack's No. 10 immersion lense. The tissue was as usual full of leucocytes or wander cells which had made their way into it. In some places the silver staining still remained perfect, the boundaries of the Saftkanälchen being well defined. Dr. Genersich observed leucocytes moving within these Saftkanälchen, and saw them pass from one stellate space to another along the narrow channels of intercommunication. In no case did he see a leucocyte pass the boundary of a Saftkanal. He moreover observed in one case the entrance of a second leucocyte into an already occupied stellate space. The two leucocytes fused together, forming one large mass. This mass subsequently divided again into two, and one part made its way out of the space. If there be no flaw in these observations, they leave no doubt as to the correctness of Recklinghausen's views.

On the Excitation of Nerve and Muscle with Discontinuous Electric Currents.—Dr. Engelmann contributes an elaborate paper to *Pflüger's Archiv* (Band. iv. p. 3), showing that if a constant current be transmitted through a nerve or muscle so as to cause it to contract, and if the current be interrupted for a short period no new wave is transmitted through the nerve, nor any new contraction excited in the muscle, provided the interruption do not exceed a certain period. He finds that the interval between two shocks must be shortened if the strength of the current be considerable, in order that no convulsion shall occur at the closing and opening of the current; whilst it may be prolonged with diminishing excitability of nerve and muscle and in animals that have been poisoned with Woorara.

On Peristaltic Movements.—M. Engelmann and G. v. Brakel (*Pflüger's Archiv*, Band iv. p. 33) show that in opposition to the statement sometimes made that anti-peristaltic movements do not occur, they may easily be rendered visible in the intestines and ureters of animals recently dead. Engelmann opened the abdominal cavity of a cat that had just been killed, and found the intestines absolutely quiescent, but on seizing and pinching a fold of intestine a wave of contraction was observed to be propagated peristaltically to the ilio-cæcal valve, and antiperistaltically to the pylorus from the point irritated. Both waves travelled at the rate of about one inch and a half per second. Numerous other experiments undertaken by M. Brakel on the ureters and uterus, as well as upon various parts of the intestinal canal of many animals, as upon those of rats, mice, pigeons (especially well), frogs, rabbits, &c., conclusively demonstrated that in all membranes composed of smooth muscular tissue wherever peristaltic contractions can be induced antiperistaltic contractions may also occur.

Physics and Chemistry.

On the Spectrum of the Aurora.—On viewing the spectrum of the aurora with a Browning's miniature spectroscope, F. Zöllner observed, besides the line in the green, which is in all probability that first noticed by Angström, and those usually seen,—a red line more refrangible than the red hydrogen line C, and which on direct comparison was not found to coincide with any line in the spectra of either hydrogen, nitrogen, oxygen, or carbonic acid. Only in those portions of the heavens which appeared strongly reddened was it of any intensity, and it was there always accompanied by the green line. F. Zöllner believes it may be asserted that the spectrum of the aurora does not coincide in its principal lines with the spectra of any of the elements as yet observed, and that the exceedingly probable and simple explanation of this is that it does not coincide with the known spectra of the gases present in the atmosphere because it is of a different order to any which it has hitherto been possible to obtain artificially; and he concludes that if the aurora is due to the incandescence of gas particles of our atmosphere, the temperature at which this incandescence takes place must be very much lower than that at which the same gases, confined in a Geissler's tube, can be rendered incandescent by electricity. The gas spectra obtained artificially must in general be the result of high temperatures, since the relatively very considerable brightness, where but few of the incandescent particles are present, necessitates a very great emission of light by each particle, and this can only be effected by a high temperature. (*Poggendorff's Ann.* cxli. 574.)

Composition of Iron-Rust.—At a meeting of the Manchester Literary and Philosophical Society, held January 24, Dr. E. Crace Calvert stated that some experiments by Sir Charles Fox led him to suppose that the composition of iron-rust was much more complicated than is generally taught in our text-books. An investigation of the subject led him to the conclusion that pure and dry oxygen does not determine the oxidation of iron, that moist oxygen has only feeble action: dry or moist pure carbonic acid has no action; but that moist oxygen containing traces of carbonic acid acts most rapidly on iron, giving rise to protoxide of iron, then to carbonate of the same oxide, and lastly to a mixture of saline oxide and hydrate of the sesquioxide of iron. Carbonic acid is thus the agent which determines the oxidation of iron; and hence rusting is due to the small quantity of this gas in the atmosphere, and not to its oxygen or its aqueous vapour.

THE PRONUNCIATION OF LATIN.

II.

The article by Mr. Max Müller, "on the pronunciation of *c* before *e, i, y, ae, eu, oe*," which appeared in the *Academy* of Feb. 15, and is argued out with his usual power, will help no doubt to make innovation on these points more difficult. His chief objection to change would seem to be the same as that urged in the Oxford circular, that it could not "be attempted without intolerable offence to the ears of all the Latin-reading nations." He speaks of "fear of ridicule," "a dislike of the harsh and disagreeable sound of such words

as *Kikero, fakit.*" This difficulty has never struck me as of such very great weight; and my ear has already accustomed itself to look on *Kikero, skelus, skio* and the like as even more euphonious than their former sounds. Of course I assume that *Sisero, Sesar, Sephalus, sinic* and the like are still to be English for the new *Kikero, Kaesar, kynicus*, just as much as for Κικέρων, Καῖσαρ, Κέφαλος, κυνικός. Our present English pronunciation of Latin appears to afford some arguments to the point. Some centuries ago we pronounced with the rest of Europe (I assume now the new and corrected sound of the vowels) *cana, cara* and the like as *kana, kara:* when the revolution took place in our vowel sounds, we said *kena, kera*, not *sena, sera.* Now that we propose to reform our vowel sounds in *cena, cera*, why should we find *kena, kera* more offensive than *sena, sera?* Our English *k* is common before all vowels alike and such consonants as it can precede in Latin, and is at least as euphonious as *s* or *tch: kettle* and *kin* are not less mellifluous than *settle* and *sin: Kikero* I prefer to *Tchitchero;* and I doubt whether *Kikero* is to an Italian more offensive or strange than *Sisero*, as they too have abundant *k* (*ch*) sounds before *e* and *i.* Assuredly the many Greek words like *Cilicia, Cibyra, scena, cithara, Cithaeron* I would rather have with their Greek than their Latin sounds.

Quite the same is my experience with the very numerous cases of *-ci, -si, -ti* before another vowel: *vicies, visio, vitium; species, spatium, ratio, gratia, solacium.* Habit here too is all-powerful, whichever direction it takes. The common English pronunciation of Greek words like Λυσίας is I believe Λυshίας, Πελοποννησhιοι, Μιλησhιοι and the like, though custom seems to permit a more correct sounding of the σ. The pronunciation of the oldest Greek scholars within my recollection, such as the late Bishop Butler and Mr. George Burgess, proved that some generations ago Greek was in many points sounded more like Latin than it is now. Bishop Blomfield was fond of telling an anecdote about a Freshman examined by Porson. The Freshman talked of *βέλshῐον*: Porson intimated a preference for *βέλ-τῐον.* The Freshman politely allowed the Professor to please himself; but had all his life been accustomed to *belshion* and intended to stick to it. I think it not very unlikely that before his degree he became reconciled to *βέλτιον*, and that if the will were present, it would take us less time to exchange *rayshio* for *ratio, speeshiees* for *spekies.*

Nay if we keep within the limits of the Oxford paper, we shall be forced to many awkward inconsistencies. Suppose we are comparing the successive forms of words which we see collected in the first volume of the new *Corpus Inscript.* such as *coira, coera, cura; Cailius* and *Caelius; Coilius* and *Coelius, Caicilius* and *Caecilius*, we must pronounce *Koira, sera, kura; Kailius* and *Selius; Koilius* and *Selius; Kaisilius* and *Sesilius.* The more ancient *pulcer* and *Gracci* will be *pulser* and *Graksi*, the more recent *pulcher* and *Gracchi* will be *pulker* and *Grakki: coëpi* and *coepi* will be *koëpi* and *sepi.* And so with an indefinite number of terminations: *baca* and *bacae* will be *baka* and *basae, siccus* and *sicci* will be *sikkus* and *siksi.* Long-suffering as we are on such points with our present system, a partially improved method would perhaps render them intolerable. The Italian shuns such inconsistencies by substituting *ch* (=*k*) for *c: secco, secchi*, and *lungo, lunghe.*

It is doubtful whether our improved *y* sound of *j* will not by contrast make such inconsistencies appear even more flagrant. Habit makes us acquiesce in our English way of pronouncing such words as *ioci, iugi, coniugibus* and the like: but will not *yosi, yuji, conyuyibus* be somewhat uncouth? The Italians practically reverse this process, and give our *j* sound to the consonantal *i*, and our *k* and hard *g* sound to the *c* and *g*, by writing *giuochi, gioghi.* This *gi* in fact is the almost universal substitute for the Latin *j, aiutare* (*adiutare*) being quite exceptional.

But though to my present feeling to reform the pronunciation of *j* for instance and leave that of *c* unchanged would almost be worse than to do nothing, the important point is to know what is right or probably right. However firmly one may have held the common belief that the sound of the Latin *c* was in all cases the same as κ or our *k*, the fact of such an authority as Mr. Max Müller calling it in question must make one hesitate. Still a variety of considerations compels me to retain my former belief.

He points out with much force that it does not follow, because Greeks and others in transferring Latin words into their own language always represented *c* by *k*, that therefore the sound of the two letters was always identical. And yet the fact that Greek and barbarian, Goth and German alike, do reproduce the Latin *c* by *k* is such a *primâ facie* argument of identity or near resemblance that strong counter-evidence is needed to rebut it. Hahn's Grammar and Dictionary show that the Albanian has sounds representing most of the modern corruptions of the Latin *c*, such as various σ and ζ sounds. The *cicer*, which must have been imported into those countries in early times, perhaps by Atticus on his farm at Buthrotum, is represented by κγικγερε: this *y* (or German *j*) sound being exceedingly common in Albanian before all vowels, α and ο as well as ε and ι. Now when I think of the Greek Κικέρων and then of his own eponymous *cicer* reproduced on one side by the Albanian κγικγερε and on the other by the German *kicher*, each of these languages showing only the first and to them most natural deviation from the pure *k* sound, the concentrated force of the three impresses me strongly.*

For the Greeks, though indeed they did represent *f* by φ, took much pains to reproduce the most peculiar Latin sounds. How trying must it have been to the eyes and ears of a Greek—unless he wished to laugh at the barbarians—to find in his Polybius Ποστούμιος Ῥήγουλος (Postŭmius Regŭlus), in his D. Cassius Οὐολτούρνον (Vulturni), in his Dionysius Οὐολούσκιος (Volscius), in his Ptolemy Οὐιρονεδρούμ, and the like. If the Latin *-ce* and *-ci* had anything of an *s*-sound, why should not the Greeks represent them by some combination of ξ or ζ or σ, such as were used in Byzantine times? The Greeks would probably have given to these sounds some conventional meaning, as to those odd accumulations of *ου*: nor do I think they would have cared for the quantity of such barbarous words; or, if they had cared for it, would have hesitated to change it. Indeed any consideration of quantity seems to me to apply with tenfold force to the supposition of an *s* added to the *k* sound in Latin, so long as quantity was regarded, or to the Italian *tch*, which surely must have been anterior to the English or French *s*-sound.

Yet more weighty to my mind is the fact that the Romans in all cases expressed κ by *c.* In old times they could only reproduce Greek words in the rudest way; but for several generations this nation of philologers expended vast energy in overcoming this difficulty. For this purpose they introduced no less than five "diacritical" letters or combinations

* It strikes me as improbable that Ulfilas, after years of intercourse with Roman dignitaries in Constantinople during its early days, and living with his flock in the midst of Latin-speaking nations, should have got his Latin words through any "Greek transliteration;" and, as to the form *aivaggeli*, surely although in modern Greek γγ and in Italian *ng* are alike sounded as *ng*, the very fact that the Greeks put γ for ν and that some of the best Roman grammarians wished to write in Latin *aggulus, aggens, iggerunt*, and the like, prove that it was different in ancient times.

of letters, *y*, *z*, *ch*, *ph*, *th*, in order to reproduce with the nicest accuracy every Greek sound; and schooled their tongue to utter words which once were most strange to them. At first content with *Tēses*, they finally brought themselves to adopt *Theseús*, a sound and intonation most alien to a Roman ear. Long satisfied with *Saguntum*, with *sepurus* or *sepirus*, *lucinus* or *licinus*, they came at last to *Zacynthus*, *zephyrus*, *lychnus*, containing each of them three letters or combinations of letters utterly foreign to them. So that at length they learnt to revel in such sweet sounds as *Antheús*, and *Mnestheús*, and *Actiàs Oreíthyia*.

Why then, when they had got to *Cepheús*, *Cephalus*, *Chalcis*, *cithara* and the like, if *c* was not exactly equivalent to *k*, did they not adopt here too a "diacritical" letter? One was at hand, more ready for use than any of the five adopted, their own *k*, now lying idle, with only an antiquarian value before *a* in a few words or symbols of words. And on this point the *dekembres* of No. 844 of the *Corpus Inscr.* vol. i. seems to have some bearing. This is one of nearly 200 short, plebeian, often half-barbarous very old inscriptions on a collection of ollae. The *k* before *e* or any letter except *a* is solecistic, just as in No. 831 is the *c.* instead of *k.* for *calendas*. From this I would infer that, as in the latter the writer saw no difference between *c* and *k*, so to the writer of the former *k* was the same as *c* before *e*. Perhaps *keri* tells the same tale, if, as Mommsen assumes, it be the genitive of *cerus* (*creator*).

The following too appears to me to have no small significance. In Cicero's time from an abuse of Greek fashions the aspirate was permanently attached to a few Latin words. Cicero tells us (*Orator*, § 160) that till late in life he had persisted in saying *pulcros*, *Cetegos*, *triumpos*, *Cartaginem*; but after a hard struggle evil habit and public opinion forced him to insert the *h* in these words. It appears now from inscriptions and Quintilian (1, 5, 20) that this *h*, which in some words was permanent, in others not, was attached to *c* alike before *a*, *o*, *u* and *e*, *i*: in the first vol. of the *Corpus Inscr.* we find *Volchacia* and *Achilio* (*Acilio*); often *Pulcher*, but also *Pulcer*. We have *Gracchus* and *Graccus*, *Gracchis* and *Graccis*: Quintilian refers to what he calls Catullus' "nobile epigramma" *Chommoda dicebat*, and says that some inscriptions still extant have *choronae chenturiones praechones*. It is I believe generally allowed that the ancient sound of *θ*, *φ*, *χ* was that of the tenuis with a distinct *h* sound attached to it. But even conceding that *ch* was like the modern Greek or Scotch or German guttural, in either case I do not well see how the aspirate could have been attached to the *c*, if *c* had not a *k* sound, or how in this case *c* before *e* or *i* could have differed from *c* before *a*, *o*, *u*.

And finally, what is to me most convincing of all, I do not well understand how in a people of grammarians, where for 700 years from Ennius to Priscian the most distinguished writers were also the most minute philologers, not one, so far as we know, should have hinted at any difference, if such existed: neither Ennius, Accius, or Lucilius, the three greatest of the early poets; nor Cicero, Varro, or Cæsar; nor Pliny or Quintilian, nor Gellius, Charisius, Donatus, Servius, or Priscian. Lucilius devoted whole books to such slight matters as the use of *fervit* or *fervet*; *i* or *ei* in terminations. Cicero, in his *Orator* and elsewhere, dwells on what seem to us very trivial minutiæ. Varro asserted that *lact* was right, *lac* wrong; Cæsar, in his *de Analogia*, addressed to Cicero, maintained that Varro and *lact* were both wrong, *lac* alone right. He told Cicero that the genitive of their common friend Pompeiius's name ought to have three *i*'s, and explained how they were to be pronounced; but seems to have said nothing of the *c*'s in *Cicero*. Quintilian tells us how to pronounce the *i* of *optimus*, the final *e* of *here*, and much else of an equally important nature. And all know that Gellius, Servius, Priscian, and the rest, are brimful from first to last of the most insignificant details: but of a soft *c* not one syllable.

Nay, what is even more to the point, Priscian relates at length how Pliny heard three different sounds of *l*: an "exilis sonus," as in *ille*: a "plenus," as in *sol*: a "medius," as in *lectus*. So Priscian himself finds the *n* of *nomen* to be "plenior," that of *annis* to be "exilior;" and not only is there a difference in final *m*, but the *m* of *magnus* "apertum sonat," the *m* of *umbra* "mediocre." Of *c* οὐδὲ γρῦ, singular indeed if its sound differed perceptibly before different letters; for surely the distinctions in the letters just enumerated cannot have been so very great.

Quite as little classical authority can I find for our strange confusion of sounds in many classes of words, important from their great number, as they happen to occur in so many common inflexions: I speak of *ce*, *ci*, *se*, *si*, *ti*, coming before another vowel, to all of which we give the same Hebraic *βέλshιον* sound: *iaceam*, *placeo*, *iacies*, *faciunt*, *condicio*; *nausea*, *caesius*, *divisio*; *ratio*, *gratia*, *retia*, *otium*, *indutiae*, &c. &c. The modern confusion of sounds here comes I believe not from classical times, but from the "colluvies gentium" which met together on the breaking up of the old world. Mr. Müller says Corssen has "proved (p. 54) that from about 200 A.D. words with *ti* began to be spelt with *ci*. How was that possible? if *ci* was always pronounced *ki*, then assibilated *ti* could never have been written *ci*." The "never" is surely too much: Ribbeck in his *Prolegomena* to Virgil, p. 241, gives dozens of instances where one or other of his capital MSS. writes *c* for *t* or *t* for *c*; such as *ac* for *at*, *tetera* for *cetera*, *tumulos* for *cumulos*, *etquis* for *ecquis*, in none of which can the two letters have had the least similarity of sound. But he gives not a single instance of confusion in a capital MS. between the *ci* and *ti* in question: these MSS. write without fail *dicio*, *solacia*, *facies*, *proditio*, *seditio*, *ratio*, *spatium*. And yet almost every line of Latin offers opportunities for blundering on this point. When we consider this, the half-dozen instances in Corssen seem quite inadequate to prove confusion between *ci* and *ti*. For there are but six which have even a *primâ facie* look of sufficiency: the most promising of these is *renunciationem*, from a Roman inscription of A.D. 211. But, when we examine its pedigree, we find that Orelli copies it from Reinesius's collection, "quibus nihil imperfectius vitiosiusque extet," says Iac. Gronovius: "ipse lapides nullos viderat," says another scholar: "who exceeds all bounds in saxa violentius grassando," says a third. When we remember then that in Reinesius's time *renunciatio* was the recognised spelling, that one instance after another of *conditio* for example vanishes when it can be put to the test, surely the chances are a hundred to one that the *c* is due to Reinesius or some previous transcriber, not to the old Roman chiseller. Two more of unknown age are due to old copies taken when *ocio* at least was a received spelling: two more are published by Renier from a copy taken by a French officer at Medjana in Africa, Africa great mother of barbarisms and heresies. The sixth has an unquestionable voucher: Mommsen's *Inscr. Reg. Neap.* 109 has *disposicionem*. It was copied at Salerno; but it must be late, and is very barbarous, containing also *rivocaverit*, *distituta*, *populusquae*, an unmeaning *suetad*, the language being in part unintelligible. Nay Mommsen himself in his elaborate monograph on the Verona palimpsest of Livy, after pointing out the many signs it contains of decaying classicism, adds that it is remarkably free from pure barbarisms; that it never puts for instance Latin *f* for Greek *ph*; and of course never confuses *c* and *t*, "quod qui ante *septimum* saeculum obtinuisse sibi persuadent ne! ii *vehe-*

menter errant." And yet if Corssen had applied his vast industry to post-classical times, he might have collected without effort 100,000 clear instances of the confusion in question, the only reason with many apparently for writing *racio*, *spacium*, *faties*, *speties*, being that the spelling was wrong. We still see some relics of this barbarism of the middle ages in *conditio*, *solatium*, *nuncius*, and the like.

We have however late classical authority of the fifth century for a corruption of *ti* (not *ci*): Servius tells us that *medius* was pronounced *medsius*, something like the Italian *mezzo*: Pompeius, probably of the same age, informs us that it is a fault to say *Titius*, not *Titsius*. If therefore we prefer the fifth century to the age of Cicero and Quintilian, we should say, not *Tishius*, *Horashius*, but *Titzius*, *Horatzius*: but then to be consistent we should also say *medzius*, *commodzius*. From the strange emphasis with which Pompeius asserts that *Titsius* is right, *Titius* wrong, I should infer that this was a new fashion; and that *laiktio* represented to Ulfilas the sound of *lectio* in his day, while *kautsjo* gave the sound of *cautio* in the year 551. In Servius' time the natural feeling for quantity was utterly gone: it had to be learnt as artificially as it is learnt now. But in earlier classical times such pronunciations were out of the question. Indeed if we are to observe quantity, which many of us think a vital part of reform, I hardly know how with any of the modern fashions of pronouncing we are properly to enunciate *rătio* and *Horātius*, *făcies* and *solācium*. H. A. J. MUNRO.

TO THE EDITOR OF *THE ACADEMY*.

SIR,—Having read Professor Max Müller's article in the *Academy* on the pronunciation of *c* in Latin, I take the liberty to draw your attention to a peculiarity in the pronunciation of modern Greek, which is of interest, as bearing on the subject of the article. In many of the Greek islands the κ is pronounced like the Italian *c* before the vowels ε, ι, υ; viz. they pronounce *Ciceron* for Κικέρων, *cefalí tu Círu* for κεφαλή τοῦ Κύρου, *cyriací* for κυριακή, and so on in all similar cases; while the κ preserves its harsh sound before the other vowels.

You are also no doubt aware of the soft sound which the κ assumes before the same vowels ε, ι, υ, in modern Greek pronunciation generally, as contrasted with its sound before α, ο, ω, ου. D. BIKELAS.

TO THE EDITOR OF *THE ACADEMY*.

SIR,—Prof. Munro has favoured me with a sight of his reply to Prof. Max Müller, which is to appear (as I understand) in your next issue. As this reply refers to "the Oxford circular," I think it convenient that the paper which he distinguishes by this name should be accessible to your readers. In sending you a copy of it for publication, I must ask your permission to state clearly its origin and purpose. At a meeting of the Oxford Philological Society in October, 1870, it was agreed that it was "expedient to attempt a reform of the pronunciation of Latin at Oxford;" and a Committee was appointed to frame a scheme of reform, and to make enquiries about the feasibility of introducing such a reform into the public schools. The Committee consisted of Prof. Max Müller, Mr. H. F. Tozer of Exeter, Mr. D. B. Monro of Oriel, Mr. J. Purves of Balliol, Mr. J. Wordsworth of Brasenose, and myself. By this Committee the paper which I now send you was drawn up. It was sent to the Latin Professors at the other British Universities, and to the Headmasters of many of the more important schools, with a view to elicit opinion upon the general subject. A very large majority of the Headmasters to whom it was sent declared themselves in favour of reform, but few comparatively entered into questions of detail. We were told, moreover, by some of them, that the pronunciation of Latin was one of the subjects fixed for discussion at a Conference of Headmasters to be held at Sherborne in December. I have since heard that they met accordingly, and resolved: (1) "That this meeting is of opinion that the system of Latin pronunciation prevalent in England is unsatisfactory;" and (2) "That the Latin Professors at the Universities of Oxford and Cambridge be invited to draw up and issue a joint paper to secure uniformity in any change contemplated."

Our paper was presented to the Oxford Philological Society at its meeting in January, together with an account of the correspondence to which it had given occasion, and of the Resolutions agreed upon by the Headmasters at Sherborne, but no vote followed. The paper, therefore, which I send you, and to which Prof. Munro refers as "the Oxford paper" or "the Oxford circular," cannot claim to be regarded as representing the Oxford Philological Society as a whole, and still less, of course, the University of Oxford. No one, indeed, is responsible for it but the six gentlemen who framed it. Let me observe, as I have a share in this responsibility, that our paper was intended to be practical and tentative, not final or scientific. It seemed to us that a proposal would be unpractical which should be likely to add largely to the labour of learning Latin. For this reason we imposed upon ourselves the rule of recommending no sound which could not be illustrated without reference to foreign languages or to provincial dialects of English. The effect of this rule will be seen in our treatment of the diphthongs. Perhaps you will allow me to add that a meeting of "Graduates favourable to a change in the pronunciation of Latin" was held in Oxford on the 2nd of this month, at which the proposals in our paper were considered. Twenty persons only attended. At this meeting there was a cordial agreement in the general principle of our paper, viz. that in any practical scheme of reform fine distinctions of sound, and sounds which do not occur at all in the speech of educated Englishmen, must not be insisted on. Our recommendations about the vowels, semi-vowels, and diphthongs, were also accepted, but on the subject of the diphthongs there was a good deal of division. And, further, it was the opinion of the majority that the proposed change should include the letters *c*, *g*, and *t*, which should be sounded hard before all vowels alike.

EDWIN PALMER, *Corpus Professor of Latin.*

Oxford, March 9, 1871.

THE OXFORD CIRCULAR.

THE time seems to have arrived for an attempt to reform the pronunciation of Latin in England. The pronunciation now in use among us gives to Latin a sound which it is impossible to believe that it ever had while it was a living language. It makes Latin in an English mouth unintelligible to all other Latin-reading nations. It is a fertile source of confusion in lectures which touch upon Comparative Philology.

The chief cause of these evils is to be found in the application to Latin of the modern English vowel system. In this most important part of the field the course which reform should take is obvious, as there is no controversy about the pronunciation of the vowels in ancient Rome, and, with insignificant exceptions, a uniform pronunciation of them prevails over the continent of Europe.

The diphthongs are of less importance, but of course a change in the pronunciation of the simple vowels will entail changes here also.

With regard to the semi-vowels, there is a difference between the cases of *j* and *v*. There is no reason to believe that the English sound of *j* belonged to the ancient Latin *i*, when it had the force of a consonant; but on the contrary, the Latin *i*, when consonantal, is generally acknowledged to have been equivalent to the English *y*. On the other hand although there are reasons for identifying the consonantal sound of the Latin *u* with the sound of the English *w*, there is no general consent in favour of such an identification. Scholars of the first rank dispute it, the sound of *w* is unknown to the modern languages of Latin origin, and the sound of the English *v* is employed by all European nations which read Latin to represent the consonantal sound of the Latin *u*.

In the mutes difficult questions arise. There is good reason to believe that *c* and *g* had, in ancient Rome, a hard sound only; but all the nations which now read Latin give them, more or less uniformly, soft sounds before the vowels *e* and *i*. Again, the proper method of treating *c* and *t* before *ia*, *ie*, *ii*, *io*, *iu*, is open to discussion; nor are other cases wanting in which it may be reasonably argued that the pronunciation of individual consonants by the ancient Romans was more or less different from that now current in England.

Under these circumstances, we venture to suggest that a few changes of a simple nature may suffice to produce an approximation to the ancient sound of the Latin language, which will be worth the labour involved in making them, while the inquiry into the minuter details of the ancient pronunciation is left to professional scholars.

The proposal which we would make is as follows:—
That in pronouncing Latin vowels—

ā should have the sound of *a* in *father*.
ă " " " the first *a* in *papa*.
ē " " " *a* in *cake*.
ĕ " " " the first *a* in *aërial*.
ī " " " *e* in *he*.
ĭ " " " *e* in *behalf*.
ō and *ŏ* should be sounded as at present.
ū should have the sound of *o* in *who*.
ŭ " " " *u* in *fruition*.

That in pronouncing Latin diphthongs—

ae should have the sound of *a* in *cake*.
au " " " *ow* in *owl*.
ei " " " *i* in *idle*.
eu should be sounded as at present.
oe should have the sound of *a* in *cake*.
ui " " " *we* in *we*.

That in pronouncing Latin semi-vowels—

j (*i*) should have the sound of *y* in *yard*.
v (*u*) should be sounded as at present.

With regard to the pronunciation of Latin consonants, the most important change, if it were thought that it could be attempted without intolerable offence to the ears of all the Latin-reading nations, would be that—

c should uniformly have the sound of *k*, or *c* in *cage*.
g " " " " " *g* in *gate*.

But without clearer evidence of willingness to support such a change than we at present possess, we do not wish to touch the question of the true consonants.

It will be observed (1) that we propose to abandon the current pronunciation of four vowels, five diphthongs, and one semi-vowel; (2) that the vowel *e* and the diphthongs *ae* and *oe* will, on our plan, still have but one sound, just as now; though it will be the sound of *a* as in *cake*, and not of *e* as in *lever;* (3) that we do not propose the introduction of a single sound unknown to the English language, as it is now spoken. This last point has seemed to us of so much importance that it has deterred us from attempting to alter the pronunciation of the diphthong *eu*, or to discriminate between the sounds of *ae* and *oe*.

An important paper, entitled "A Few Remarks on the Pronunciation of Latin," has just been printed for private circulation by Professor Munro, of which we give the following summary:—

It is desirable and practicable to observe quantity systematically—to distinguish between long and short, and longer and shorter, syllables. But if we are to do this, we must break alike with all existing pronunciations. We should also endeavour to reproduce approximately the "quality" of the vowels. For this purpose Italian offers many aids which it would be most unwise to neglect. English is so utterly different in all its tones from old Latin that often we cannot find in it even single sounds to give as the representative of a Latin sound. Those who know Italian should in many points take Italian sounds for the model to be followed; those who do not know it should try to learn from others the sound required, or such an approximation to them as may be possible in each case. In particular, *ā, ă, ī, ĭ, ū, ŭ, au, eu*, should be sounded as in Italian: *ē* should be the Italian "closed" *é, ae* the "open" *è* heard in *Cèsare, sècolo: ĕ* as *è*, but short: *ō, ŏ* the closed and open Italian *ó, ò:* but Latin *o* for *au* should be open, as *plòstrum, Còrus:* the rare *oe* as *ae*, or German *ö: ei*, the Italian or Latin *e* sound quickly followed by an Italian or Latin *i* sound: finally, the diphthongs in words like *eius, Graius, Troja*, should be sounded as *ē-yus, Grā-yus, Trō-ya*.

Of the consonants, *i* (or *j*) should be our *y*, *u* or *v* our *w* (see especially Gellius, x. 4, xix. 14, 5–8): *c* and *g* should be *k* and hard *g: bs, bt* should always be sounded, if not written, as *ps, pt: d* and *t* should be real dentals, not linguals as we pronounce them: final *m* was (should be?) sounded slightly and indistinctly: *quu* should be avoided (*cum* or *quŏm*): *r* we should sound more strongly and distinctly. The pronunciation of *s* should vary: *musa*, &c. as in Italian (as if *mūza*): but where it stands for original *ss*, it should be sharp (as in *sad*): so *causa* as *cau-ssa*, Ital. *cosa* (with sharp *s*), *casus* written by Virgil and Cicero *cassus*, pronounced *cā-ssus:* so, of course, *sol, ni-si*, &c. The quantity of vowels should be attended to in many cases where it does not affect metre, *i.e.* where vowels are long both naturally and by position. Thus, *āctus*, but *făctus; īnsanus, infelix*, but *indoctus; amāns, amāntis, legēns*, but *legĕntis; mōnstrum horrēndum înforme ingēns*, &c. So *ēst* from *sum* but *ĕst* from *edo*. When we scan *pātrem*, and the like, we should separate the two consonants, but keep the vowel short—*păt-rem*—the short sound being that of prose. The accent should be recalled to its right place before enclitics—*armágue, tantáne;* similarly, *postéa, adéo, tantôn, intersê, apudmêst*, &c. Elided syllables should not be altogether passed over.

Intelligence.

Messrs. Henzen and Borman have printed the *Inscriptions of the Town of Rome* (vol. vi.) as far as page 112. During Mr. Borman's absence in the field, Mr. Henzen superintended the printing. After Mr. Borman had recovered from his wound received at Mars-la-Tour, he resumed his work, and Mr. Henzen returned to Rome. The *Inscriptiones Sacrae* are nearly printed, the *Imperial Inscriptions* are ready for press. Mr. Hübner has begun the printing of the *British Inscriptions* (vol. vii.). The *Wall Inscriptions* of Pompeï, edited by Mr. Zangemeister, are finished, and will soon be sent out. Vol. iii., edited by Mr. Mommsen, has advanced from page 640 to page 800; important appendices and index will follow. Vol. v. is printed from pages 168 to 328, comprehending the eastern half of Upper Italy as far as Verona.

The Baron von Maltzan has contributed a series of Letters from Arabia to the *Augsburg Gazette*, from one of which we gather that a Himyaritic inscription reached Aden in January, about the Boustrophedon writing of which no doubt can be entertained; also that M. Halevy has completed his long and difficult exploration of Yemen, and brought back copies of about 500 Himyaritic inscriptions. M. Halevy is a French Jew, and travelled in the character of a native Rabbi. He seems to have copied the inscriptions in Hebrew characters, and to be now engaged in reconverting these into Himyaritic.

Professor Madvig, who has long been eminent among scholars for the soundness as well as brilliancy of his emendations, has just published a collection of the fruits of many years' study of Greek and Latin authors. The first volume is to contain a dissertation "de arte conjecturali," and the "emendationes Græcæ," in number above three thousand. A second volume is promised for Latin. This department is at present pursued so assiduously, and on the whole with such indifferent results, that Madvig's *Adversaria Critica*—so the work is entitled—are likely to make an epoch in the history of Philology.

We understand that the volume of miscellaneous translations now in preparation for the Society of Hebrew Literature will contain:—1. Part of the Machbeuth Ithiel, Alcharizi's version of the Makámat of Hariri, from a MS. in the Bodleian Library. 2. The Biur (commentary) on the 2nd chapter of Genesis (to be continued in future volumes). 3. Zunz on the Sufferings of Israel during the Middle Ages. 4. Bertinoro's Travels. 5. Samuel the Prince, the Letter of Chisdai to the King of the Chozars. 6. Autobiographical letter of Maimonides. The Society will also publish a translation of Aben Ezra on Isaiah, with notes, indexes, and a copious introduction.

Amongst the libraries destroyed at Paris is that of M. Bréal, the well-known Philologist.

Egyptologists will be interested to learn the following particulars which we have just received from Paris. M. de Rougé is absent, being detained by his magisterial duties at the village of Pressigny (Sarthe). There is no news of M. Chabas. M. Mariette has been at Paris during the siege, and has read a memoir on the Age of Stone in Egypt before the Academy: he has just published two vols. in fol. of *Denderah*, and the first vol. of the Papyri of the Museum at Boulac, which will be on sale for a month. M. Maspero is at Paris, and has read before the Academy a memoir on Epistolary correspondence in Egypt and the Egyptian Pronoun. He is publishing a translation of the Abbott Papyrus, which was read before the Academy in July, 1869, and already printed in the *Mémoires* of the Institute; together with his translation of the "Romance of the Two Brothers," printed in the *Revue des Cours Littéraires* in 1870, No. 47. M. Dévéria, the former colleague of M. Longperrier, died at Paris on Jan. 16.

Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance.
The Editor of The Academy *cannot undertake to return communications which are not asked for.*
The next number will be published on Saturday, April 15, and advertisements should be sent in by April 11.

NOTICE.

The Academy *will in future appear regularly on the 1st and 15th of every month.*

General Literature.

A Vision of Love Revealed in Sleep. By Simeon Solomon. F. S. Ellis, 1871.

We have every reason to congratulate ourselves when the genius of a distinguished artist finds a double channel for its self-expression—when a poet can furnish us with illustrations of his poems copied from the very visions which inspired them, or when a painter is able to tell us in words what he means to convey to our imaginations by the forms and colours of his pictures. Mr. Solomon's prose poem is a key to the meaning of his drawings. It lays bare the hidden purpose of the artist, and enables us to connect picture with picture in a perfectly intelligible series. Those who are familiar with his sketches or with the photographs which have been taken from them will recognise the perfect unity of style which marks the vision and the outlined forms. Those again who can appreciate the delicate and subtle key of colour used by the painter in his finished pictures will trace the same harmonies of hue in many of the descriptions of the vision, for instance in the vestments tinted "like the heart of an opal" and "like a flame seen through water" of the final scene.

As its name implies, this prose poem has for its subject Love. The mystery of Love is here displayed as in a pageant to the dreaming spirit of the poet by his soul conceived as an external and superior power. It is not therefore without good reason that the single illustration with which the book is adorned should represent the Soul and the Novice: in the same way, if a medieval artist had designed one woodcut for the *Divine Comedy*, he would probably have drawn Dante with Virgil or with Beatrice as his initiator in the mysteries of the spiritual world.

The Love of Mr. Solomon's *Vision* is quite distinct and unconventional. He is unlike "the bitter sweet impracticable wild beast" who bent Sappho's soul as "storms break oaks upon the mountains." He is unlike the blacksmith of Anacreon's Mythus, who forged the soul upon an anvil and then plunged it in a wintry stream. Nor again has he anything in common with the beautiful winged boy of Praxiteles, or with the runaway of Moschus. The parrot-winged fire-faced child of Arabian fancy belongs to another race and lineage. So does that champion of chivalrous love beheld in vision by Pierre Vidal, who rode a snow-white horse and had the face and limbs of a young knight, followed by the damsels Modesty and Mercy, and by Loyalty for squire. Nor, again, is the Love of this new Mythus to be found upon the pages of the *Vita Nuova*. The pilgrim who met Dante on the Way of Sighs, the grave-faced and inexorable youth who sat by his bed-side and wept, and communed with him, and was sweet and stern, has more perhaps in common with the Love of Mr. Solomon's *Vision* than any other. But he is not the same. In truth, the originality of any poetical or pictorial Mythus, such as is embodied in this vision and in the series of Mr. Solomon's drawings, consists in its creator having viewed an old problem with new eyes, and communicated to the object some of the qualities of his own soul and of the age in which he lives. This, in our opinion, Mr. Solomon has done with eminent and unmistakable distinctness. His Love is not classical, not medieval, not Oriental; but it has a touch of all these qualities—the pure perfection of the classic form, the allegorical mysticism and pensive grace of the middle age, and the indescribable perfume of Orientalism, which, by the way, finds a more than usually definite expression in the last scene of this vision. Added to these general qualities we trace in this spirit of love a vague yet intense yearning, a *Sehnsucht*, which belongs to music and is essentially modern. If, finally, we seek that characteristic which is most truly peculiar to the poet himself, we find it to be a certain Biblical solemnity of spiritual sense inbreathed, as Milton phrases it, into the forms of art.

It savours somewhat of Philistinism to question the details of a vision and to expect an exact meaning in all the figures of so pictorial a work of imagination as this of Mr. Solomon's. Yet we may call attention to the subtlety by which he has divided the soul of the seer from the man himself, and has made that soul with purged and disembodied vision act as the hierophant of a revelation which the man in his completeness would have been incapable of discerning. Other poets have chosen some guide, like the Sibyl of Virgil or the Beatrice of Dante or the Angel of the Apocalypse, for their illuminator. Mr. Solomon has proved the modern quality of his genius by the selection of no other power than that of the indwelling soul of man. The first words of the soul upon the pathway of initiation are:—

> "Thou hast looked upon me, and thou knowest me well, for in me thou but seest thyself, not hidden and obscured by the cruel veil of the flesh. I am come forth of thee for thy well-doing."

After this preface the soul leads forth the seer to a place where Memory abides; then showing him simple Pleasure in the figure of a woman:

> "Looking upon her, I saw that she was good, but I knew that there was that about her that left me not content; she was like as sweet notes heard once and lost for ever."

Then they come to the station of Love bruised and bound; where also Passion is revealed as "she who had wounded and had sought to slay Love, but who, in her turn, was grievously wounded and tormented in strange self-devised ways." Passing from this place, they reach "him who had done battle with Love, Death, who would love us did he dare, whom we would love did we dare." Parenthetically it may be said that one of the most beautiful and subtly finished portions of this *Vision* is that in which Death is described. Divine Charity bringing Sleep to earth, Time holding stricken Love within his arms, and Night and Dawn and Day, and the Spirit of Dreams in sleep, are all seen in the successions of the mystery. Till at length, after a space of time and after due lustrations and equipment in the robes of purity, insight is granted to the seer into the holiest of Holies, where Love himself, no longer afflicted and dethroned, but in his glory and his power, is displayed. Thus lightly and vaguely to indicate a few scenes of the *Vision* is all that a critic can attempt. To read the inner meaning of the mystery—to decide whether Love wounded by Passion upon earth, abandoned to oblivion, put out of sight and overgrown by weeds and briars of this mortal life, is revealed in his full splendour at the gates of Death, or Death's twin-brother Sleep—must be left to the judgment of the readers of the pages of this book.

It is enough once more to point out the subtle harmony which subsists between the poetic and the pictorial faculties of the artist's genius. Those who desire a comment on the figured allegories of Mr. Solomon will find it in his *Vision;* those who wish to see his vision as he saw it with their very eyes have only to turn to his drawings for full and ample illustration. The frontispiece of the book is itself a good example of the painter's style, at the same time that it sets forth the relation he desires to establish between the seer and the soul.

If any definite criticism should be added to this account of Mr. Solomon's *Vision*, it must be that there is a certain vagueness in the succession of the scenes, and that his literary style, while it shares the delicacy and peculiar flavour of his pictures, has somewhat also of their profuse perfume and languor. To lay stress on these points would be ungrateful. We should rather be thankful that such an artist as Mr. Solomon has found a voice so clear and sweet as that which may be listened to in this narration of his Apocalypse of Love. J. A. Symonds.

History of the Spanish Drama. [*Geschichte des Dramas.* Von J. L. Klein. VIII. *Das spanische Drama.* Erster Band.] Leipzig: 1871.

This volume of Klein's work only contains his views respecting the origin of the Spanish drama, and critical notices of those early pieces, in verse and prose, which preceded the first acted plays. He halts long by the way, to recount events in the lives of his authors, to rhapsodize on their works, and to draw fanciful parallels; so that we reach the end of one bulky volume without being introduced to a single dramatist whose plays were actually represented on a stage.

The Italian priesthood, unable to suppress the gross farces acted by popular buffoons, at length so far yielded as to adopt such representations as a part of the ceremonial of their Church; and these sacred plays passed from Italy into Spain, certainly before the time of Alfonso the Wise, who enacted laws respecting them in his code of the *Siete Partidas.* This is the view taken by most writers of the origin of the Spanish drama. But Klein seeks for more distant sources; and suggests that the germs of drama may be found in a poem written at Saragossa in 380 by Aurelius Clemens, in which six vices and six virtues contend for mastery in hexameters; and in a soliloquy of the soul on sin, written by St. Isidore in the 7th century. He fancies that rudimentary dramatic ideas may be detected in the life-like dialogues of Clemens, and in what he calls the dialogue-soliloquies of St. Isidore.

He finds another source of the Spanish drama among the Persian Arabs, but he fails to exhaust this interesting branch of his subject, by connecting the Persian representations with any analogous performances in Moorish Spain. He mentions that Alexander Chodzkos, the Russian Consul at Teheran, in his investigations into the origin of the *T'aziyah* (not *Téazié*, as Klein as it), or tragic plays to commemorate the martyrdom of Hosein and Hassan, traces them back to the time of the feud between the Beni Omeyyah and "the Persian Arab Ali-Bekenner." Klein says that these death lamentations then came into vogue, were introduced into Spain by the Western Khalîfas, and thus formed another germ of the Spanish drama. I cannot conceive who can be intended by the "Persian Arab Ali-Bekenner." Ali the Khalîfah was not a Persian in any sense, but it was the feud between him and Mo'âwiyah, involving the death of Hosein and Hassan, which unquestionably gave rise to the division of the Moslems into Sunnis and Shiahs, and to the traditional commemoration of the martyrdom of the sons of Ali. *T'aziyah* means condolence, and as Easterns never condole without making a noise, it signifies also lamentation, as Klein correctly observes. But it comes from the verbal root *'aziya*, "to take comfort," and not, as Klein states, from *'aza*, "grief." The fullest description of the Persian *T'aziyah* will be found in a letter written by Pietro della Valle (*Pinkerton*, ix. p. 38). The performance is certainly dramatic, and bears some resemblance to the miracle plays of the middle ages.

There can be no doubt that the public recitation of poems and romances was one of the amusements of the Arabs prior to Islam, and Fresnel tells us that the reciters on these occasions were masked, and were attended by what he calls "un rhapsode" or crier. Here we have some elements of a dramatic performance, and the usage has certainly obtained among the Arabs ever since. That the public recitation of poems passed into Spain with the Arabs cannot be doubted, and, as some of the Khalîfahs of the West were Shiah, the commemoration of the martyrdom of Hosein may also have been celebrated in Spain. But there is no Arab dramatic literature. In the *Bibliotheca Arabia-Hispania Escurialensis* of Casiri, which is quite a treasury of Moorish literature, there is no notice either of the commemoration of Hosein, or of any other dramatic performance. We are also told by Moratin that Conde had never found a sign of any dramatic writing among the many Arabic manuscripts he examined.

All traces of the Roman theatre disappear from Spain with the Arab conquest, and the genius of the Mohammedans was opposed to dramatic representations. Even now a devout Sunni regards the Persian *T'aziyah* with horror, not only on account of the claim to the Khâlifate in favour of Ali's descendants which it involves, but also from religious scruples. The Provençals, with a poorer language than the Arabs, and less versed in science, were endowed with rich gifts of imagination, and were deeply moved by tales of heroism and love. Their Troubadours established colleges for singing and recitation in north-eastern Spain; but we find nothing in their songs which breathes the dramatic spirit. The origin of the Spanish drama will be sought for in vain among the Gothic saints, Moorish poets, and Provençal troubadours.

The first idea of secular dramatic representation was doubtless based on the mystery plays imported from Italy in the early part of the 13th century. At the same time the old ballads and chronicles, and even the literature of the Arabs, must have influenced the writers who led the way to the foundation of the secular drama of Spain. Among these, the warlike Infante Juan Manuel holds a distinguished place; and Conde is of opinion that the "Conde Lucanor" of that prince was compiled in imitation of Spanish tales. Indeed there is distinct evidence that Juan Manuel was conversant with Arabic. Juan Ruiz, generally called the Archpriest of Hita, wrote between 1330 and 1343. He never composed dramatic pieces, but his genial comic dialogues, and his humorous satire are akin to the spirit of a dramatist. The Archpriest tells us that his verses were written in prison, which gives occasion for Klein to break out in rhapsodies on the *Käfigpoeten*, and to call upon the thrush and the nightingale to lament that their songs perish, while those of the caged Archpriest survive. Klein compares him to Boccaccio, likening the poetry of the Spaniard to a Venus in nun's clothes, and that of the Italian to the same goddess in a state of nature. Ticknor had already drawn an interesting and more judicious paralled between the Archpriest of Hita and our own poet Chaucer, who wrote a little later in the same century.

Passing over the quaint and pleasant redondillas of the Jew of Carrion, and the more important and popular "Coplas de Mingo Revulgo," which Klein discusses in much detail; this author's first volume concludes with a discussion of the *Celestina*, the undoubted immediate forerunner of Spanish acted plays of a secular character. The first act of this famous tragi-comedy, as it is called, was written in 1480 by Rodrigo Cota of Toledo, and the other twenty by Rojas of Montalvan. Its length and structure make the *Celestina* incapable of representation; but Ticknor has pointed out that its dramatic spirit and movement have left traces of their influence on the national drama ever since. The leading character in the piece is the old witch Celestina, whom Klein well describes as the quintessence of all the evil and all the genius of her age and country; and he justly holds that the dramatic merit of the authors rests on this creation. He agrees with all previous critics in the opinion that the idea of Celestina is derived from the Trota Conventas, a somewhat similar character drawn by the Archpriest of Hita, and with the majority in believing that the first and the subsequent acts are by different hands. But while others have remarked upon the extraordinary similarity in style and finish which pervades the whole work, Klein maintains that there is no comparison between the first and subsequent acts, and that there is not so much life and movement in half a dozen of the later acts as in the first. Yet he allows that the ninth act is the work of a master in the art of describing empassioned love, and would alone suffice to give its author fame as a tragic poet. Klein makes much the same defence of the shameless libertinism of thought and language to be found in the *Celestina*, as appears to have been put forward at the time of its first publication. "Is not a doctor to cure an ulcer?" he exclaims. He holds that the great fault of the *Celestina* lies in the lameness of the catastrophe, caused by want of knowledge of the poetic atonement of sin. But he fully admits that the dramatic history of Spain has its true commencement in the *Celestina*, not because it was the first work of its kind, but because of its literary excellence and of its thoroughly national character. Its popularity was certainly remarkable: it was translated into many languages, Cervantes gave it the highest praise, and down to the time of Don Quixote no book was so much read in Spain.

Although the works of these forerunners of the Spanish secular drama are discussed by Klein with great fulness and with evident mastery of the subject, some disappointment will be caused, in perusing his volume, by the fanciful parallels and rhapsodies and by the long digressions in which the author occasionally indulges. Sometimes, too, an impression is left that he cannot fully appreciate the beauties of Castillian poetry; as when, speaking of that exquisitely plaintive elegy by Jorge Manrique, he coldly observes that the son might as well be celebrating the death of the stoic Zeno as that of his father. These remarks, however, are only intended to point out blemishes which seemed to detract from the undoubted merits of the work. In perspicacity it is not to be compared with the history of Spanish literature by Ticknor, and the works of Møratin and Ochoa will be more useful to the student from the length and completeness of their extracts. But Klein has certainly done good service by discussing, with great fulness of detail, and in a lively and imaginative style, although with an overflowing redundancy of adjectives, the creations of those early Spanish authors whose works are now little known to the general reader, but whose influence was felt and may be traced in the writings of the later and more famous poets and dramatists of Spain.

C. R. Markham.

Young Russian and Old Livonian. [*Jungrussisch und Altlivländisch.* Politische und culturgeschichtliche Aufsätze von Julius Eckardt.] Leipzig: Duncker and Humblot, 1871.

This book can hardly be considered an organic whole; it is true that its Young Russian and Old Livonian parts have one fundamental idea in common—that of representing the very complex and extensive influence of Germans and German ideas over the East of Europe, and the energetic national reaction at present setting in against it. But the several essays which form each part respectively have been chosen from apparently no other motive than that they had been left out of Dr. Eckardt's previous publications on these two subjects, of which the *Baltische und Russische Culturstudien* was reviewed, *Academy*, No. 2, p. 51.

The Young Russian portion consists of three essays—"The New Era in Russia," "Alexander Herzen," and "Pictures of Travel in Gallicia." The first of these has already appeared in English, forming the opening portion of Dr. Eckardt's *Modern Russia* (published by Smith, Elder, and Co., 1870), and was noticed *Academy*, No. 6, p. 163. The second essay is so far connected with the first as it contains the biography of the principal agent in bringing about the political and social changes therein described. The connection of the third is so little apparent at first sight as to require special explanation in the preface. The thought which suggested the juxtaposition also appeared in the first paragraph of one of his previous works, *Die baltischen Provinzen Russlands*, where a place is assigned to the Poles of Lithuania and Gallicia by the side of the Swedes of Finland and the Germans of the Baltic Provinces, as representatives of Western civilisation. Both in the biographical sketch of Herzen and in the "Pictures of Travel" Dr. Eckardt writes with a spirit and vivacity which cannot fail to interest the reader, and his knowledge of the Russian language enables him to draw on sources of information little accessible in Western Europe. His observations on the abortive attempts made to naturalise German literature in the Bukovina show that his patriotic feelings do not interfere with that scientific objectivity which is for the most part so favourable a feature in German writers on historical or quasi-historical subjects. The weak and wavering policy of the Austrian government, and the unpractical character of the Poles, with their contempt for details, are well brought out. So, too, is an additional source of political anarchy—the very recent origin of Gallicia as a united whole. Austria's share in the partition of Poland united into the one crown-land of Gallicia fragments of Little Poland and of Red Russia which had never been so closely united before.

The second and much smaller half consists of five sketches relating to the politics and society of the Baltic Provinces during the last century. They have much less living interest than those which describe the Russian movements of the present day; at the same time they have more of that value which depends upon access to unpublished documents. The first sketch describes the experiences of Herder's friend Hartknoch, as a bookseller in Livonia between 1763 and 1789. The second and third throw light on the career of two German adventurers in the service of Peter the Great—Heinrich Fick and the Admiral von Sievers. Still more light is thrown on the times in which they lived by the succeeding sketch entitled "*Aus dem Leben der Familie von Münnich.*" In it an attempt is made to illustrate the transition which marked the latter part of the eighteenth century—a transition from a formalism in which individuality was lost to a greater spontaneity both of feeling and its expression. The last essay describes the subjection of Courland to Russia, from an unpublished document by

one of the actors in the comedy, who is somewhat mysteriously described as Baron X.

Arthur J. Patterson.

The Life and Letters of the Rev. Richard Harris Barham, author of *The Ingoldsby Legends*, with a Selection from his Miscellaneous Poems. By his Son. Bentley, 1870.

The popularity of *The Ingoldsby Legends* has been so great that even those who do not admire them must turn with interest to any memoir of their author, and would welcome with pleasure a less "imperfect biography" than that before us.

Mr. Barham was apparently a prosperous man, with whom life, on the whole, passed easily. He had property of his own, as well as a minor canonry of St. Paul's and a small living in the City; and in the anxieties of his profession, if the petty squabbles of the Chapter-house are excepted, he had, if we may judge from these volumes, but little share. He was not one of those who write for bread, nor is he represented here as making others laugh while he wept himself; accordingly, there is not in his poems much of the irony of true humour; but he appears to have been always trying to be funny, and to live with funny people. The book is crammed with his funny letters and his funny rhymes, and the funny sayings of the men he met, and the stories which he had heard and those which his friends had heard, and even with stories which have a less valid claim than these to form part of his biography.

The Ingoldsby Legends have been well called "a protest against mediævalism," opposing, as they do, a healthy vulgarity to excess of refinement in thought and expression, and a sturdy Protestantism to the *dilettante* churchmanship of the day. If the spreading love of art and increasing fastidiousness make us prone to tolerate what is dull and feeble for the sake of what we call "the æsthetic," we may find an antidote in these poems, where extravagant rhymes and boisterous metre are the virtues of style, and where the thought is never so amusing as when it verges on the coarse, the indelicate, or the profane. Now nothing more interesting could be expected from a life of Mr. Barham than that it should tell us whether he raised this protest with any conscious or deliberate intention. On this point the work before us is not explicit. He was a staunch Protestant, and meant to support by his writings the cause which he professed; he was also a zealous Tory; but whether he understood the wider meaning of his work, we are not informed. It would seem that he did not. He was a coarse, kind man, with a genial love of laughter, and a curious fondness for tales of ghosts and murders; and what he liked he wrote.

But one is reluctant to judge the man from his *Life*, even though it is written by his son; for it is a mere piece of bookmaking. As a collection of anecdotes about Hook and Sydney Smith, it may be called amusing; and there are a few facts that are even valuable; such as those connected with the family of Mr. Hughes, whose wife, from her great knowledge of local histories, supplied the materials for many of the *Legends*, and whose son, then a boy at Rugby, contributed towards a proposed novel his experience of "School-days," the germ, it may be, of *Tom Brown*.

But this one-sided biography is an injustice. Mr. Barham was a loving and useful man, though not a great one; and it is cruel that so large a portion of his *Life* should be allotted to the funny sayings and doings of himself and his friends and other people.

R. S. Copleston.

Marlowe's Faustus. By A. v. d. Velde. Breslau: 1870.

Dr. v. d. Velde's metrical translation of *Marlowe's Faustus* may also be of interest to the English student, as in the introduction it is proved most conclusively that the English poet derived his subject-matter from the *German* history of Faustus printed 1587, with which (and not with the old English ballad) Marlowe agrees in most important points. An English translation of the German work was not, it is true, published until a later time, but the missing link seems to be supplied by the two actors, Thomas Pope and George Bryan, who appear to have performed in English plays both at Dresden and at Berlin from 1585 to 1587, and to have then returned home; from them Marlowe may be supposed to have learnt the tragical history of Faustus. Dr. v. d. Velde agrees with those critics who assign Marlowe's play to the year 1588 or 1589, in support of which opinion he quotes the lines in the first act where Faustus speaks of "chasing the prince of Parma from our land"—Alexander Farnese, prince of Parma, leaving the Netherlands soon after the defeat of the Spanish Armada (1588).

The author of the present publication was not aware of Goethe's high opinion of Marlowe's play, which has recently become known through Henry Crabb Robinson's Diary; had he been acquainted with it, he would no doubt have expressed himself differently on p. 30. Unfortunately, he could not avail himself of Dyce's excellent edition of Marlowe, which would perhaps have modified his statement, that the quarto of 1604 contains, to all intents and purposes, the genuine work free from interpolations and "additions:" see Dyce, p. xxi in the new edition, 1865.

W. Wagner.

LITERARY NOTES.

Mr. W. R. S. Ralston is engaged upon what seems likely to prove a very interesting book on the popular literature of Russia. An attempt will be made in it to convey to Western readers some idea of the rich stores of song and story which Russian collectors have within the last few years been gathering together, and also to place at their disposal some of the results at which the leading Russian critics have arrived with respect to their age, origin, and value. It will be divided into three parts, of which the first will be devoted to the songs of the people, the second to the epic poems, and the third to their prose stories.

In the first part some account will be given of the chief festivals of pagan origin still kept up in Russia, and of the relics of old songs which are consecrated to them.

The books from which it will be mainly taken are Orest Miller's excellent "Manual of Russian Literature" (*Opuit istoricheskago obozryeniya russkoi slovesnosti*), Sakharof's "Folk-lore of the Russian People" (*Skazaniya russkago naroda*), Tereshchenko's "Manners and Customs of the Russian People" (*Buit russkago naroda*), Snegiref's "Festivals and Superstitious Rites" (*Ruskie prostonarodnuie prazdniki i suevyernuie obryadui*), and, above all, Afanasief's three invaluable volumes on the "Poetical Views of the Slavonians about Nature" (*Poeticheskiya Vozzryeniya Slavyan na prirodu*). This part will include a sketch of the "Fairy Mythology of Russia," and a brief account of the marriage and funeral songs of the people, as well as of their charms, incantations, &c.

The second part will deal with the *Builinui* or popular epics of Russia—the poems in which are celebrated the deeds of the old Slavonian heroes, especially of those who were supposed to be gathered together in the Court of Vladimir at Kief. An attempt will be made in it to familiarise the English reader with the names and characters of the chief of these heroes—such as Svyatogor, of the mythical period; Ilya Muromets, Alësha Popovich, and Dobruinya Nikitich, of the Vladimirian cycle; and Sadkoi or Vasily Buslaevich, of Novgorod. And some account will be given of the discussion which has taken place in Russia relative to the origin of these poems. The authorities chiefly relied upon in this part will be the great collections of

popular poetry (*Pyesni*) made by Ruibnikof and the two Kiryeevskys, and that of poems on sacred subjects (*Stikhi*), edited by Bezsonov, under the title of *Kalyeki Perekhojie*, Maikof's essay "On the Builinui of the Vladimirian Cycle" (*O builinakh Vladimirova tsikla*), various treatises by Buslaef, the most erudite of all the writers on the subject; the articles in tbe *Vyestnik Evropui*, in which Stasof maintained that the Builinui were not of Slavonic origin, but were imported directly from the East, and the bulky reply published by Orest Miller under the title of *Ilya Muromets*.

The third part will be devoted to the prose stories (*Skazki* and *Legendui*), which will be taken for the most part from the rich collection (in eight parts) of Afanasief. A certain number of the most original tales will be translated, and an analysis of others will be given, so as to show in what points the Slavonic renderings of the old stories with which we are all so familiar resemble or differ from those which are peculiar to the various other branches of the Aryan race.

M. Louis Leger, one of our contributors for Slavonic literature and history, has just been called to Prague to undertake the direction of the *Correspondance slave*, a Bohemian journal published in French.

The *Revue des Cours littéraires* is to be transformed into a journal like the *Saturday Review*, under the name of *La Tribune politique et littéraire*.

In an article in the second January number of the *Revue des Deux Mondes* on the well known Finnish epic *Kalevala*, M. A. Geffroy is of opinion that its present form must be received with reservations. The poems collected by Dr. Lönnert, a more scrupulous Macpherson, are genuine, but the arrangement is only matter of conjecture. M. Geffroy gives a sketch of the highly mythological framework of the poem, on which legends of the common popular type are freely grafted.

George Sand's *Journal d'un Voyageur pendant la Guerre* will be read with interest as a companion to some passages in Goethe's works bearing on a time of similar national disaster. The writer, whose descriptive style is full and flowing as ever, believes that universal suffrage has actually done something for the political education of the peasantry, of whose future, as a class, she has always been inclined to take a more favourable view than other republicans. (*Ibid.* Feb. 15.)

M. E. Blanchard publishes from the papers of the Lazarist missionary, Armand David, an account of his explorations undertaken last summer in the little known region of the Ourato, north of Ortoos, or, as he writes it, country of the Ortous. A comparison of the flora and fauna of that district with those of other parts of China is promised. (*Ibid.* Feb. 15, Mar. 15.)

In the *Révue des Cours littéraires*, M. E. Despoir, following M. Fournel, treats the common version of the story of Gilbert as fabulous. The young satirist was, at worst, neglected by D'Alembert; Fréron extolled him, his poems found a publisher without difficulty, and he was in receipt of several pensions from the court, representing an income of more than two thousand livres. He died insane and at the Hôtel-Dieu; but the first fact is explained by an accident—a fall from his horse in riding, and for the second his patron, M. de Beaumont, only is answerable, as in health the poet had free quarters in his house. A contemporary notice speaks of the archbishop as sending to enquire after him twice a day, and knows nothing of the neglect and misery which have been supposed to assimilate his end to that of Chatterton.

At a recent sitting of the Academy Della Crusca in Florence the secretary read an obituary memoir in honour of the late Archduke Leopold of Tuscany, who at the time of his death (27th February last) had been the oldest member of that body. Among his services to literature and science are recited the editing of Lorenzo de' Medici's poems, the collection of the MSS. of Galileo, the association of Rosellini and Raddi with the mission of Champollion, the mission of the naturalist Parlatore into the extreme north of Europe, the preparation of the catalogues of the Palatine Library, the publication of the memoirs of the Accademia del Cimento, and the encouragement which he gave to the University of Pisa.

Eugenio Camerini devotes an article in the *Nuova Antologia* for March to the dramatic works of Giovan Battista Porta, considered as one of the precursors of Goldoni. They are chiefly of interest as showing, first, the versatility of the author, and then the intimate connection which subsisted, until Goldoni's time, between the written drama and the improvisation of the actors. A good actor not only knew by heart all the retorts of the dramatic *répertoire* of the age and could bring them into the point, but he could also arrange impromptu the regulative comedy of intrigue, made up of disguised, practical jokes and lovemaking at cross purposes, with a dexterity probably at least equal to that displayed in Porta's published works, which may therefore be taken as a fair specimen of the native Italian drama imitated in Molière's farces.

In reviewing Mr. Stephens's Catalogue of Prints at the British Museum, we demurred to his writing "Sir Edmund Berry Godfrey;" inferring that the name was correctly (as very generally) printed in contemporary documents "Edmundbury," and must be related to "Bury St. Edmund's." But Mr. Stephens was right, and our reviewer was wrong. A record written by the father of Sir E. B. Godfrey sets forth: "His godfathers were my cousin John Berrie, Esq., Captain of the Foot Company of the town of Lidd: his other godfather was my faithful loving friend, and my neighbour in Grubb St., Mr. Edmund Harrison, the king's embroider."

The following Anglo-Saxon texts are promised by the Early English Text Society:—The Blickling MS. of unique homilies, to be edited by Dr. Morris. Lives of Saints by Ælfric from Cotton MS. Jul. E 7. Homilies from a Trinity Coll. Cambridge MS. by Mr. Aldis Wright. Some homilies of Lupus by Mr. Lumby, who has also in the press a translation (into A.-S. verse) of a poem attributed to Bede, *De Judicio Mundi*.

Art and Archæology.

PEEL COLLECTION OF PICTURES.

For a few weeks past there has been a report of a change in the Directorship of the National Gallery. Perhaps indeed the wish was father to the thought, as several gentlemen were already in the field as candidates for the important position. Mr. Boxall, however, retains office, and has celebrated his renewal of the tenure of direction by the most important purchase of pictures ever made by the nation, at one time—the collection of the late Sir R. Peel; the most important in point of number and sum expended at least. The taste of Sir R. Peel was limited, hidebound, we may say. The Dutch school alone was the school he appreciated, and that distinctively from the Flemish properly so called. Nevertheless, we have gained by this purchase of Seventy works several Flemish and English pictures, and first and most important of all Rubens' "Chapeau de Paille," an Antwerp lady of the Lunden family in a great black Spanish hat, not of straw; and also another Rubens, "The Bacchanals," and two Rembrandts.

With these exceptions and a few English pictures, the whole of this large number of seventy are Dutch of the later time. By Hobbima (whose absence some would say was a merit in any gallery) there are four. By Ruysdael, another dark green artist, there are three; W. Van de Velde, eight; Teniers, three; J. Van de Velde, two; Adrien Van de Velde, two; Karl Dujardin, two; A. Cuyp, three; and by P. Wouvermans, the painter of cavalier parties assembling among classic ruins, and other "compositions," that can only be characterized as nonsense pictures, no less than six. Besides all these there are a good many by other Dutch artists of a higher class: Gerard Dow, Terburg, Jan Steen, Metsu. The price paid by the country, it appears, is 70,000*l*., a thousand pounds each picture, if the

number is exactly seventy. This must be double the value of the one-half of this entire collection, but much below the value of perhaps a dozen specimens comprised in the list. We are glad to find that the National Gallery, not having expended all the annual grants for some years past, possesses a considerable portion of the funds necessary for this extensive purchase.

SOCIETY OF FEMALE ARTISTS.

THE gallery in Conduit Street, Regent Street, is again open: the collection being both in oil and water colour of very various merit. The principal exhibitors are Madame Bodichon, Miss Southerden Thompson, Mrs. Backhouse, E. V. B., the Misses Claxton, and Misses Thornycroft. Perhaps we ought to add Miss Bouvier, and Mrs. Ward, were it not that the hot round face that lady paints has been seen so often that we are positively repelled by it. "A Girl at Crochet" (13), Mrs. Backhouse, is an able study, though the child does not look enough engaged in her work—a very bad fault; and "The Little Blonde" (122), by the same, is also distinguished by executive ability. But the best (99) figure picture in the room is perhaps "L'Espoir de la Famille," by Madame C. Bisschop, *née* Kate Swift. The picture is quite French in manner, and both the old lady and the bonne are unmistakable French women; the power of colour is very remarkable. "Goodrich Court, an Autumn Morning" (3), by Miss E. D. O'James, has a richness and fulness of tone that seems to promise good results on a larger scale. "Stonehenge" (129), by Madame Bodichon, is admirably felt. The warmth dying out of the sky and the sad grays spreading over it realise the sentiment of the place. "Souvenir d'Algérie" (111), and "Atlas Mountains, near Algiers" (118), are not elaborated works but rather sketches. No. 133 is a small sea-shore with the white surf of the tide tumbling in, admirably painted, by Miss Edith Wheeler. The artist has called her picture by Tennyson's lines,

"Break, break, break, on thy cold gray stones, O sea!"

but as there are no gray stones nor shingle of any kind, nor even sand, the quotation seems rather inappropriate. The works exhibited by E. V. B. are fine pen-and-ink etchings, showing the invention of this accomplished designer. They are called "Dream No. 1," "Dream No. 2," and so on; but, although interesting to decypher, appear to us not so well drawn as many illustrations we have seen engraved with these initials to them.

Altogether, this exhibition does not seem to do the English lady painters justice, or rather we should say the English lady painters do not seem to unite in this Society. If all the female exhibitors in London concentrated their abilities on these walls, we should have a different tale to tell!

NEW BRITISH INSTITUTION, OLD BOND STREET.

THE second Spring Exhibition of this body opened on the 27th February. The room is a small one, and comprises only 210 pictures in oil, a good number of which are Belgian, some of them sent over to the forthcoming International Exhibition, but not delivered there on the assurance that the space devoted to Belgium is long filled up. There is besides a stand in the centre of the room with Water Colour Drawings. As usual in all our smaller exhibitions the landscapes predominate, and among these, although Mr. J. G. Naish puts in an appearance in "Westward!" (162), and also Mr. A. Macallum, and other English landscape painters of standing, the best picture by a long way is by a Belgian, M. J. von Luppen, "Souvenir des Ardennes, Belgium" (79). The daylight so clear and unaffected is really refreshing, and very rare indeed, especially among our landscapists, who are very prone to compete with figure painters in amount of colour. Among the more important works the principal are, Mr. Lucy's "Burial of Charles I." (72); Mr. Archer's (205) "A Bit of Romance: the Host takes his Guest home for the Night"—the host being a hermit, and the guest a weary knight; and Mr. Selons' "Ariel" (173)—

"On the bat's back do I fly
After sunset merrily."

INTERNATIONAL EXHIBITION OF 1871.

(To be opened in May.)

WE have already incidentally mentioned this first of a series of important future exhibitions, which will, very probably, make a great change in the fortunes of the whole of the others. Even the Academy will, it is said, be impoverished this year by the number of important works already destined for the International. With plenty of space, which negatives in some measure the importance of "self and friends," and let us hope, without coterie influence, this vast collection of all kinds of decorative and general productions of art and manufacture will attract thousands, while other exhibitions are limited to hundreds, and must become infinitely more desirable as a show room for the world in general, and so of higher importance to artists. There will always remain one exclusive Art exhibition, and this must be Burlington House, but every other will be second to the International if that is at all so successful as we presume it will be. The Committee appointed, however, to decide on the works to be received or rejected is of a very anomalous kind. Sir Dudley Coutts and Lord Elcho are unexceptionable, but the artistic portion of the Committee is different; it is composed of the following gentlemen:—Messrs. Elmore, Warren, Alfred Hunt, Frank Dillon, H. Marks, and Alfred Clint. WILLIAM B. SCOTT.

ART NOTES.

The Italian *Official Gazette* for the 10th ult. publishes a condensed minute of the proceedings of the Commission for the preservation of ancient monuments in the Marches, at its general meeting held at Ancona on the 10th of December, 1870. The report of the Marquis Raffaelli, president for the section of Macerata, after reciting the steps taken for the preservation and restoration of paintings in that city, and calling the authorities to account for their delay in handing over to the local municipalities the works of art belonging to the suppressed religious foundations, proceeds to recommend excavations at Urbisaglia (the ancient Urbsalvia), where a colossal bronze foot of the Augustan period was found two months ago near the site of the amphitheatre. The report of the section of Pesaro mentions the discovery of a Roman inscription at Urbino, and near Pesaro itself of what must "be placed among the most precious memorials of Italic art and religion, before Rome was, of archaic Egypto-Italic style, and depicting the passage of some souls to the next world on board of three boats." From Fano an arrangement is reported for supplying the place of Guercino's "Guardian Angel" in the church of Sta. Lucia with a copy, and removing the original (the subject of Mr. Browning's well known poem) to a place of greater safety.

The director of the Royal Galleries at Florence has made arrangements for the immediate exhibition, in the corridor leading out of the Uffizj, of a selection from the unexampled collection of Italian engravings ordinarily packed in the portfolios of the museum. The selection will extend from the earliest wood engravers down to Calamatta, and among its specimens of the predecessors of Marc Antonio will comprise Pollaiuolo's "Fight of the Ten Naked Men," Botticelli's "Assumption," and Mantegna's series known as the Giuoco.

According to the *Zeitschrift für bildende Kunst*, there is a hitch in the negotiations set on foot for the purchase, by the St. Petersburg government, of the set of antiques of mixed Greco-Egypto-Asiatic style found with the remains of an important temple at Golgos in Cyprus, by General Cesnola.

M. A. Legros has completed a large and noble picture of a Spanish church-interior, with a group of priests and worshippers kneeling in the choir; also a full-length life-sized portrait of an English gentleman standing uncovered by a church-porch.

Mr. G. Mason's large picture of Reapers going home at sundown will not be finished in time for the Royal Academy this year.

The veteran and learned artist, Tommaso Minardi, born at Faenza in 1787 and appointed to a chair in the Academy of St. Luke so early as 1821, died a few weeks ago in Rome. Minardi was in his youth a friend of Canova, and was at Rome the founder and leader of a school opposed to that of Camuccini and the "academical" followers of David. Longhi's famous en-

graving of the Sistine "Last Judgment" was executed after a drawing by him. His finished works in painting are not numerous. He was the author of some highly reputed critical discourses.

The supplement to Lützow's *Zeitschrift* for March 17 contains a further chapter in the controversy between the Berlin Academy of Arts and the Minister Von Mühler. The minister had taken notice of the first remonstrance of the Academy only in a new minute addressed, not to that body itself, but to the Senate. The members of the Academy hereupon again appeal directly to the minister to withdraw his interference; insisting on the purely artistic nature of the question, and on the embarrassment in which they find themselves placed by proceedings of a nature to deter competent persons among their body from taking any part in exhibition arrangements. Artists, they contend, will rather not exhibit at all than under the restrictions henceforth to be imposed; and a solution can only be found on condition that "his excellency will graciously condescend to drop his proposed agreement with the Royal Academy upon principles which admit of no agreement, and will not refuse his assent upon purely artistic problems to the authority of the Academy, which that body believes it can justly claim to exercise: which assent once given, the last word in this matter would have been spoken." Meanwhile the *teterrima causa* of the strife, the picture of the "Birth of Venus" by Schlösser, is being exhibited with great applause in the Cologne Museum. It is described at length in the *Kölnische Zeitung* for March 14; together with a "Judith" by Clemens Bewer of Düsseldorf, which the writer strongly praises, and a "Stephen before the Judges" by Julius Hübner, the distinguished director of the Dresden Gallery, which he condemns almost as strongly.

The *Fortnightly Review* for April contains a contribution by Mr. Sidney Colvin to the already copious literature of the Mausoleum of Halikarnassos, taking occasion partly from the final arrangement of the remains of that monument in the British Museum, partly from the approaching completion of the Albert Memorial in Hyde Park. The aim of the writer has been to treat the subject from the point of view of general culture rather than from that of rigid antiquarianism. At the same time he attempts a detailed historical and æsthetical estimate of the place which these remains hold in Greek art, with peculiar reference to the relations subsisting between the Mausoleum frieze and the friezes from Phigaleia and from the temple of Athene Nike, and with notice of the most recent criticisms of German writers. It may be pointed out that with regard to the well known and exquisite fragment in relief styled unanimously hitherto a female charioteer, the writer passes over the sex of the figure with the ambiguous word "youthful." In point of fact this figure is certainly male. The beauty of the face and fashion of the hair, together with the flowing drapery, made upon its discoverers as well as upon subsequent students the impression of a type at first sight decisively feminine. The evidence by which a closer examination reverses this impression is as follows. The throat has the masculine characteristic of the "Adam's Apple" strongly marked: the breast is not so much concealed by the stumps of the outstretched arms but that its masculine character must be confessed: the arms preserved upon similar fragments of the same frieze, who are less defaced in this respect, though more in others, are men's and not women's arms: the hair is blown back by the wind in a way to heighten the feminine effect of its dressing, which for the rest is the same as in some extant male sculptures: and lastly, the talaric chiton, clinging to the figure in the shape of an elongated S-curve and flowing full about the heels, is no index of sex, but a costume almost universally characteristic of drivers in chariot-races; a good example for comparison being the bearded ἡνίοχος of the pseud-archaic amphora from the Cyrenaica (C. 116 in the British Museum Catalogue). These considerations have persuaded Mr. Newton, the distinguished discoverer of the slab, that his own and the received account of it must henceforward be altered in this particular.

Dr. Julius Meyer of Munich is about to republish, in a separate form, and with additional matter, the elaborate and exhaustive article on Correggio which has appeared in the fifth and sixth serial parts of his great new edition of Nagler's *Künstler-Lexicon*.

On the occasion of the Dürer anniversary in May a special exhibition of drawings and prints by the master will be held in the Museum of Vienna. It is also announced that a modernised version and commentary of Dürer's letters is to be executed by Dr. Moritz Thausing for the new series of *Literary Sources for the History and Technic of Middle Age Art*, projected under the care of Dr. von Eitelborger.

The Dresden exhibition of Holbeins, projected for last summer and postponed because of the war, will probably take place in October of this year, and in addition to the Darmstadt Madonna (which it is proposed to hang for the sake of comparison beside that of the Dresden Gallery) will include many examples from different parts of Germany, and also, it is believed, some that will be lent by Her Majesty from the English Royal collections.

A new edition of Messrs. Crowe and Cavalcaselle's *Early Flemish Painters*, enlarged and corrected, is shortly to appear.

M. Heilbuth sends for exhibition to the Royal Academy a landscape with figures, being a recollection from Bougival. M. Hébert's Roman picture of "Morning and Evening" we understand to be also in England.

Music.

Trio en Sol Majeur pour Piano, Violon et Violoncelle, Op. 45; composé et dédié à Lady Flower, par J. L. Ellerton. London: Augener and Co.

Compositions of the class to which this trio belongs, though not so infrequently produced by Englishmen as is commonly supposed, are very rarely printed and almost never performed. Music exists, for all practical ends, in time; and such time as the comparatively few English people who can play or who care to listen to instrumental chamber music can give to it, they would in general rather give to what has been already tried and found pleasing than to what, being as yet untried, may be found otherwise. The unenterprising management of our opera-houses and concert-rooms is but an expression of English popular taste—more properly, of English distaste for, or disinclination towards, the unknown. The result has been notoriously most discouraging to English musical composition, which, it is certain, could but a little of the sunshine of public favour be let in upon it, would reveal itself in proportions as noble as, to the mass of our countrymen, they would be surprising.

Mr. Ellerton's trio is a work which efficiently performed—by one of Mr. Chappell's, Mr. Ella's, or Mr. Holmes's parties of *virtuosi*, for instance—would give a cultivated audience very great pleasure. The subjects are for the most part elegant, and always sufficiently worked, the episodes are fanciful, and the passages thoroughly becoming the instruments to which they are assigned. In the first movement especially—always, from its form, the most difficult to conduct—the successive phrases grow out of one another in a manner which, while apparently spontaneous, and the result no doubt of a happy inventiveness, can only be attained to by those who have subjected that inventiveness to severe and long-continued discipline. This movement is followed by an elegant and coherent Adagio, in E; and this again by a Scherzo, remarkable for the purity of its part-writing, in E minor. The composition is brought to an end by an Allegro Vivace in the original key, G. The ingenious and effective treatment of a fragment the first subject immediately prior to its re-entry (at the *à tempo* in p. 36 of the score) will not fail to strike the intelligent hearer. From the words "second edition" on the title we suppose this

composition—altogether new to us—was first published on the Continent, and, like many others from the same accomplished hand, has there found both doers and hearers.

John Hullah.

NOTES ON MUSIC.

We have had amongst us for some weeks past a great musician, composer, executant, and conductor, a veritable *maestro*, a "vollkommener Kapellmeister." Few amateurs can know so little about continental music as for a moment to have confounded Dr. Ferdinand Hiller with the mob of makers of transcriptions and breakers of pianoforte strings, who at about this time of year are wont to descend upon London; but it is evident, from the scanty attendance at his first recital, and the perplexed admiration of those who have only recently made acquaintance with his music and his pianoforte playing, that rumour had done less than justice to his genius and accomplishment. During his too short stay among us—it will have come to an end before these lines are in type—Dr. Hiller has conducted a performance of his cantata "Nala and Damayanti" (composed for the last Birmingham Festival) at St. James's Hall; also one of his symphonies (that in E minor, entitled "Es muss doch Frühling werden"), and played Mozart's "Coronation Concerto" (No. 24, in D) at the Crystal Palace. He has, moreover, given three concerts, not only exclusively composed of his own music, but in which he himself was the principal performer. The impression left by the former is that it reveals varied invention, inexhaustible fertility of resource, and perfect knowledge of and command over the material in which the musical composer works. Of his pianoforte-playing it is hard to speak in terms that, to those who have not followed it up, will seem other than extravagant. In mechanism it is simply faultless; and, more than this, indicative at every turn of something altogether unattainable by the mere *virtuoso*. His cadenzas to Mozart's concerto, evidently thrown off at the moment, seemed like parentheses which a sympathetic commentator had interpolated for the further illustration of a text, and which were so thoroughly in keeping with it that they might easily have been the work of its author. Everybody who has made acquaintance with Dr. Hiller, as composer or as executant, must feel that his views of the capabilities of music have been enlarged thereby, and that a new source of instruction and pleasure in the art has been opened up to him.

The second concert of the Philharmonic Society (on Wednesday the 22nd ult.) had but one fault—excess. Who can pretend to take in—as it were, at a gulp—two symphonies of the highest class, a pianoforte concerto grand in every sense, two overtures, one as recondite as it is unfamiliar, and three or four vocal pieces, one of them not only new to everybody who heard it but in a style as remote from our sympathies as our experience? A large portion of the Philharmonic audience answers this question, concert after concert, by leaving at the close of the first part, or after the first piece in the second. Surely one symphony, of the class of the "Reformation" or the "Jupiter," is as much as the most enthusiastic and accustomed auditor can enjoy at a single sitting, and this should always close the first part of it—supposing, of course, the division into parts, long since abolished at the Crystal Palace, to be a necessity at St. James's Hall.

"I like your opera very much," said Beethoven to Paer, who had sent him a copy of his *Leonora*,—"so much indeed that I mean to set it to music." It is a pity that Signor Petrella did not send his *Le Precauzioni* to Rossini, who might have been roused from the musical inactivity of his later years by the perusal of a *libretto* so full of capital situations, occupied too by so many strongly marked characters. As scene after scene passed away on Tuesday night (the 21st) at the Lyceum, and with them opportunity after opportunity, always missed by the composer, it was impossible not to feel that if Signor Petrella be anything like a fair representative of musical Italy of to-day, musical Italy is in a less hopeful condition than political. Yet, it is certain, the *maestro* enjoys a great reputation among his countrymen, and is the composer of some dozen of operas of promising titles—e. g. *Marco Visconti*, and *I Promessi Sposi*—which have attained considerable transalpine popularity. In inverse proportion however to the ineptitude of the composer to turn situation to musical account was the power and the determination of the genial and experienced actors of the Opera Buffa troupe to turn it to dramatic. This and this alone could have carried the opera through even in the presence of the very indulgent audience who assisted at its first presentation. The music is wanting in melody, character, and constructive skill; its orchestration is that of the *casino;* but the personations of the always penurious and commonly angry Mugio by Signor Borella, and of the half-witted Cola by Signor Ristori, were efforts of histrionic skill not easily to be forgotten. Madlle. Colombo added another to her successes in the part of Albina, and in combination with Mesdlles. Monari and Veralli made a group which, like that in *Il Matriomonio Segreto*, relieved by its elegance the somewhat broad comedy, and occasionally farce, of which the drama is largely made up. Alas! that the application of all this power and sweetness should have been turned aside from *Cosi fan Tutte*—which it seems we are not to have—wasted on this feeble product of Signor Petrella.

The most distinguished musician our country has produced for a century and a half—the single Englishman who, since Purcell, has made a reputation among those who speak the universal language out of as well as in his own country—has been knighted. The musical compositions of Professor Sterndale Bennett are universal possessions, played, sung, and studied wherever singers, players, or musical students are to be found. They form, however, but a portion of the work by which he has entitled himself to the gratitude of his countrymen, and the signal favour of his Sovereign. Throughout his life he has been a preacher and a prophet in his art; giving freely his time and his talent wherever they seemed likely to be available for good—scattering with unsparing hand seed wherever there seemed a chance of its bearing fruit. Not to speak of the numerous rising musicians who owe their present condition and status to his influence, direct or indirect, the resuscitation of the Royal Academy of Music, which, by a long course of amateur management, had been brought to the verge of utter extinction, is a service which, while it could only have been rendered by a man of special position and genius, attainments and character, few so placed or endowed would have cared to undertake or could have carried into effect, in the face of difficulties and discouragements of which it will be useful and interesting some day to give an account.

The "acoustic properties" of the Royal Albert Hall, so many trials of which under various but always unfavourable conditions have been authorised by the directors, will have been fully and fairly tested before these lines are in print. Of the result of the last of these—the rehearsal on Tuesday of the music to be performed on Wednesday at the opening of the building by Her Majesty—it is as hard to speak confidently as it would have been of any of the foregoing ones; for, though on this occasion the orchestra was for the first time occupied by a large and efficient band of vocal and instrumental performers, the auditorium was empty; and that which, *damped* by the presence of a large audience, may prove only sufficient *resonance*, inevitably took the form, without it, of *reverberation*. Various movements of different characters were performed—a cantata by Sir Michael Costa, composed expressly for the occasion, another by Prince Albert, various solos, concerted pieces and choruses, with and without orchestral accompaniment, and an overture. Of these the movements or portions of movements of which the pace was the slowest and the intensity the least were heard, from whatever part of the building, to the best effect. Thus while every note and combination of notes in the prayer from Auber's *Masaniello*—in simple counterpoint almost throughout, and without orchestral accompaniment—came on the ear clearly and in its true proportions, the overture (to *La Gazza Ladra*), every note of which *must* have been played by so competent an orchestra with perfect accuracy, was from no part of the building intelligible, and from some parts simply a mass of confusion. How far the occupation of the auditorium will render loud and rapid passages practicable to any good effect in the Royal Albert Hall remains—at the moment of this present writing—to be proved. Possibly it may be found necessary to adopt new and special methods of orchestration for the music intended for performance here.

Science and Philosophy.

An Examination of the Utilitarian Philosophy, by the late John Grote, B.D. &c. &c. Edited by J. B. Mayor. Bell and Daldy.

This work, the first of a number of unpublished treatises left behind by the late Professor of Moral Philosophy at Cambridge, has been very carefully edited by his literary executor, Professor Mayor. The few alterations which he has permitted himself, without affecting the peculiar character of Mr. Grote's style, as a natural and intimate expression of very fresh and independent thought, have decidedly mitigated the perplexing prolixity in which it has always tended to luxuriate.

The style, indeed, in its good and bad qualities alike, is very well adapted to the substance of the treatise: and will lead the discerning reader to expect from the book exactly what it has to give. Mr. Grote has set himself to teach, by example and precept equally, the need and importance of being unsystematic: and that not merely as a temporary probation, but as a permanent condition of sound thinking on moral subjects. Not that we are tempted to this renunciation of system by any delusive promises. "No person," says Mr. Grote, "who has seriously thought about moral philosophy can expect from it a real solution of the difficulties and perplexities of human life." All we can hope to attain, by duly recognising the "largeness and variety of human life," is "right manner of thought upon the subject." Mankind in general, in so far as they act upon principle, act upon a rather random mixture and alternation of principles. The philosopher should aim at clearer apprehension and better application of these different principles: but should distrust any attempt to harmonize them, from fear of narrowing his view. We are not surprised to find that Cicero, the *bête noire* of exact reasoners, is a favourite moralist of Mr. Grote's.

Now criticism of systems and methods, at any rate in departments of thought where there is so much divergence as there is in Ethics, is continually required: and can perhaps be best performed by a thinker who has come to distrust all systems. And Mr. Grote's acuteness, subtlety, and impartiality, eager interest in human thought and life, and uniformly friendly and conciliatory temper, are qualities as rare as valuable in a critic. But to criticise methods properly, one must take an interest in them as methods, and continually try to view them in their most perfect form, carefully disconnecting their intrinsic excellencies and defects from any confusions or inaccuracies imported into them by individual expositors. Here Mr. Grote fails. He has a keen insight into the properly human element of a philosophy, into the "manner of thought" and habit of feeling of its adherents: but he has little insight into the abstract element. He can describe thinkers and discuss opinions: but is an impatient anatomist of systems, and a bad judge of their internal coherence.

Thus though many of his attacks on Mr. Mill's "neo-utilitarianism" are very effective, and indeed quite unanswerable, they rather lose their force from being mixed with much random hitting that often falls very wide: and the whole criticism, though very kindly in tone and abounding in expressions of sympathy, curiously fails to be sympathetic: because Mr. Grote has never managed to look at morals as a utilitarian looks at it. The strangest example of this is that in several places he forgets that the absolute end of utilitarianism is not happiness, but maximum happiness: naturally, in such places, his argument beats the air in the blindest fashion.

This randomness is increased by the loose colloquial manner in which he writes. Such a style has, as I have said, a certain charm, and is a natural one for an original and impartial thinker to adopt, in recoil from the sham preciseness got by taking vague notions for definite, and the illusory completeness attained by ignoring difficulties, which we often find in English ethical writers. Still, the effort to be precise and complete cannot be pretermitted without serious loss. A man who writes as he would talk, however deeply he may have reflected, inevitably writes much which is inconsiderate, and which, if he is criticising, will seem captious. And some of Mr. Grote's criticisms are of this kind: sudden small cavils, which the caviller himself elsewhere half answers.

One or two of the weightiest objections against Mr. Mill's form of utilitarianism have been already presented to the public, though with less force and closeness, by Mr. Lecky: who unfortunately weakened their effect by trying to argue against all modes of hedonism at once, thus confusing himself and his readers, and becoming an easy prey to the enemy. *E.g.* the criticism by either writer on Mr. Mill's "qualitative preferableness of pleasures" is essentially sound: but Mr. Grote puts the dilemma more clearly. Either the qualitative distinction resolves itself after all into a quantitative one, or pure utilitarianism is abandoned. If one pleasure is preferred to another *not* because it is more pleasurable, but because it is "higher," "better," more "dignified:" surely we have judgments indistinguishable from those of a "moral sense," overruling purely hedonistic comparison. It matters not that Mr. Mill makes the preference to lie between pleasures instead of actions. If the pleasures are not compared in respect of mere pleasantness, we have intuitivism in the garb of hedonism.

Another peculiarity of Mr. Mill's system is its Proof, or rather "considerations capable of determining the intellect in its favour," as their author modestly describes them. "The sole evidence," says Mr. Mill, "it is possible to produce that anything is desirable is that people do actually desire it:" and he has no trouble in proving that all men desire happiness as he defines happiness as the sum of objects desired: so, each man's happiness being the sole thing desirable to himself, the [greatest] happiness of the community is the sole thing desirable to all persons taken together, i.e. *per se*.

The prolonged guerilla warfare which Mr. Grote carries on against this ingenious edifice of paralogisms is a good illustration of his style. He is throughout subtle: he is much too long: he leaves nothing unsaid: he says some things twice over, makes too much of petty arguments, drops great ones too casually, and presents the whole in a bewildering spontaneity of semi-arrangement.

Still the reader is made to see very clearly that, as it

belongs to human nature to frame ideals of disposition as well as of action, what each man desires is usually different from what he thinks desirable. Again, Own Happiness and Others' Happiness, though both happinesses, are in relation to the individual's appetition much more dissimilar than similar, and the desirableness of the latter does not follow from the desiredness of the former. No doubt if humanity could perform collectively an act of appetition, it would desire its own collective happiness—that being, on Mr. Mill's definition, a tautological proposition: but as it is always the individual who desires, there appears so far no reason why the aggregate of happiness should be desired or thought desirable by any one. Further, happiness, as Mr. Mill defines it, is a notion to which Benthamic measurement cannot be applied: it may be doubted whether all pleasures are commensurable, but it is quite certain that all objects of desire are not. Grant that we can compare the gratifications of Conscience and Palate: a virtuous Epicurean claims to have done the sum and brought out a clear balance in favour of Conscience: still this does not help Mr. Mill, who vindicates for utilitarianism the dignity of self-sacrifice, and says that "virtue is to be desired for its own sake." Virtue and its attendant pleasure are as incommensurable as a loaf of bread and the pleasure of eating it: much more is a notion which includes all four one to which quantitative measurement is inapplicable.

It is curiously characteristic of Mr. Grote that, after showing the uselessness of "happiness," so interpreted, for calculative purposes, he declares a strong preference for it over the old Benthamic notion of "sum of pleasures." In its very vagueness it seems to him "truer to human nature." He might at least have noticed how perfectly free Bentham is from Mr. Mill's confusions. Both alike hold the psychological proposition that a man always does seek his own happiness, along with the ethical proposition that he ought to seek the happiness of other people: but Bentham did not base the latter on the former. Indeed he can scarcely be said to have formulated it expressly. The word "ought" was distasteful to him. He, Bentham, desired the general happiness: "selfishness in him had taken the form of benevolence;" but he never expected such a transformation to be general. So to attain his own benevolent ends, he calls on the legislator (whom we may call a professional philanthropist) to execute a delicate and complex readjustment of the consequences of actions, so that benefit to the community may always be artificially combined with a balance of pleasure to the individual. Mr. Mill too usually requires the legislator—aided by the educator—

"to bid self-love and social be the same;"

however, in the 4th chapter of his *Utilitarianism*, he has made a solitary and unfortunate attempt to dispense with both.

In the chapter on Sanctions, Mr. Mill, while relying much on the educator to produce a utilitarian conscience, gives him a powerful auxiliary in the "social feelings of mankind," which are to "constitute the strength of the utilitarian morality." Mr. Grote sees here the great divergence from Bentham: but, confounding the man with the method, he fails to see that there is not necessarily any deviation from Benthamism. If the sympathetic pleasures and pains are really of great and growing influence, it is a mere oversight in Bentham not to have given them an important place among his sanctions (as he half acknowledges in a letter to Dumont, written in 1821). But when Mr. Mill describes these sympathetic sanctions as "disinterested," and gives a psychological account of self-sacrifice, we are conscious of an effort to combine the incompatible: for if sanctions are pleasures and pains, "disinterested sanction" is, as Bentham says, an inexact term, and self-sacrifice an abnormal tendency to fly in the face of sanctions.

Much of this and other confusion in Mr. Mill's treatise is well traced by Mr. Grote to his ethical "Positivism:" *i.e.* the attempt to blend views of what will be and what ought to be, while the logical relation of the two is never clearly worked out. In the common view it is the essence of morality to frame some ideal of action, varying indefinitely from the actual. "Positivism" embodies the reaction against such ideals, and claims in some way to do without them and put "fact" in their stead. It may take the form of a disposition to be content with things as they are, with human nature as it exists in oneself and others: such an "esprit positif" has for maxim

"Faire ce qu'on a fait, être ce que nous sommes."

But we rather know ethical Positivism at present in the form of a "morality of progress." It is rather "faire ce qu'on fera" that our Positivist now desires: the world is moving and improving, and he will move and improve with it; if he be an enthusiast, just in front of it. In one of the most suggestive chapters in the book, Mr. Grote examines this notion of Progress, argues the necessity of an ideal standard in order to judge that movement in a given line is improvement, and criticises in detail prevalent views of the right lines of progress for speculation and society.

The non-critical part of Mr. Grote's book I can scarcely call constructive. It is not even a sketch of a system: it is a collection of sketches. He considers that utilitarians are right in the general assertion (carefully explained to be almost meaningless) that all action is aimed at happiness. But he would distinguish the study of the general effects of Conduct on happiness, from the enquiry into the principles of Duty, or right distribution of happiness, and from the investigation of the Virtues, or generous dispositions, which must be left freely to follow their special altruistic aims, and not made to depend on a utilitarian first principle. What the last two methods are to be, and how the three enquiries are to be harmonized, Mr. Grote does not clearly explain. In his desire to comprehend the diversity of human impulses, he has unfortunately neglected the one impulse (as human as any) which it is the special function of the philosopher to direct and satisfy: the effort after a complete and reasoned synthesis of practical principles. He has somewhere drawn a neat distinction between "moralisers" and "moralists." With a similar antithesis, one may say of the constructive part of his treatise that it contains much excellent philosophising, but very little philosophy. Henry Sidgwick.

The Intelligence and Perfectibility of Animals from a Philosophical Point of View. With a few Letters on Man. By Charles George Leroy. London: Chapman and Hall, 1870.

This volume consists of a number of letters written in the second half of last century, partly under the pseudonym of "The Naturalist of Nuremberg;" the remainder purporting to be replies to these earlier ones addressed by a friend of the "Naturalist's" to a lady of his acquaintance. They are, however, all from the same pen, that of M. C. G. Leroy, who, born in 1723, succeeded his father as ranger of Versailles and Marly, and are the results of his observations, while occupying this position, on the habits and intelligence of animals. Their object is to show that animals are capable of self-improvement and of perfectibility within certain limits, and that that faculty which is ordinarily called instinct is in reality a form of intelligence or reasoning. In order to appreciate the boldness and originality of M. Leroy's views, it is

necessary to endeavour to throw oneself back into the state of the development of thought in his day. It is curious to trace the demands on science made at different epochs by orthodox religious dogma. Just as now the evolutionist is told that the theory of a continuously acting creative power is opposed to the teaching of Scripture, so a century ago orthodoxy required of scientific men the belief that man was the only being possessed of even the least degree of mental power. Hence the doctrine, favoured by the French materialists, and derived from Descartes, that the apparently intellectual actions of animals are due to a mechanical automatic cause, was adopted by those who then attempted to combine science with religion, and received some sanction from the writings of even so profound a naturalist as de Buffon. It was the absurdity of this doctrine which Leroy set himself to demonstrate, his arguments being derived from the habits of the wild and domestic animals which came under his notice at Versailles and Marly. In so doing he anticipated views respecting the relationship between the mental faculties of man and those of the lower animals which have not been fully developed until our own day.

Even within the last thirty years the prevalent idea among naturalists with regard to instinct was that it was a faculty implanted directly in the animal, transmitted from generation to generation without change and without capability of improvement, and entirely different in nature from that reason which is the proud boast of man alone. When Mr. Darwin published his theory that instinct is nothing but the experience of former generations inherited and constantly improved, just as bodily peculiarities or mental tendencies are inherited, the idea was a novel one to the greater part of the educated public. Nearly a century ago, however, we find M. Leroy combating the notion of a "predetermined harmony," and maintaining that the faculty of animals which is ordinarily called instinct is as deserving of the name of intelligence as are our reasoning powers, differing from them only in degree. He argues that the mere fact of any one chastising a dog for a fault is a proof that he considers the dog to be gifted with memory; and the dog, in exercising its memory, and refraining in future from committing the same fault for fear of chastisement, reasons in a perfectly syllogistic way.

M. Leroy divides the actions of animals into two classes, those which proceed from instinct and those which result from sensibility; and here he does not seem to us so happy as in his more general theory. By instinct he means intelligence acquired either directly by the experience of the individual or hereditarily by the combined experiences of its ancestors; by sensibility he understands the necessities of the external organization of the animal. Under the latter head he would include the first seeking for its proper food by the young animal, whether carnivorous or herbivorous. But it would seem necessary to suppose some inherited intelligence even in the first attempt of an animal to seize its appropriate food, still more in the first effort of water-birds hatched on land to gain their proper element—unless, indeed, we adopt the theory which some writers are now again bringing forward, of an innate intelligence and power of adaptation independent of experience.

M. Leroy's Letters on Man are not so satisfactory, and appear to be fragmentary. Their main object is to maintain the position that the faculty which chiefly distinguishes man from the rest of the animal creation is the possession of the power of compassion or sympathy. Enough has however been said to show that in publishing an English edition of the work the translator has brought a useful contribution to the history of the development of scientific thought.

Alfred W. Bennett.

PROFESSOR DE MORGAN.

In Augustus De Morgan England has lost a really great mathematician, and one who was many things besides a mathematician, though here our limits will only allow us to speak of him in this capacity. His claim to a high place in science rests mainly upon what he did for the foundations of analysis, upon his having powerfully contributed to render its methods more profound and more rigorous. It is well known that much of the work of the analysts of the last century has had to be done over again by the analysts of this. Relying on the generality of the instrument they were using, the older enquirers often cared but little to examine into the assumed universal applicability of their methods, and seem to have regarded all symbolical results as true in some sense or other, notwithstanding the arithmetical untruth that might be apparent in them. The reform of the bases of the differential and integral calculus, which was inaugurated by Cauchy, was introduced into this country by De Morgan; and probably his *Differential Calculus* is, at this moment, one of the very best books on the subject in existence; it is certainly, considering its extent, one of those mathematical books in which the fewest errors of reasoning can be detected. Curiously enough though De Morgan was the founder in this country of what we may term the *rigorous* school of analysts, he was not orthodox on one of its cardinal points of doctrine—he did not reject the use of divergent sines with that perfect horror which Abel, Gauss, and Cauchy endeavour to infuse into the minds of their readers. But the scorn which De Morgan poured on what he termed the "*Soit* $\phi(x)$ *une fonction quelconque*" style of argument is all that is required to make the student reflect that the more general any reasoning in mathematics (or indeed in any other science) may appear to be, the more narrowly does it need to be scrutinized at every turn.

It is remarkable that a man of Augustus De Morgan's great original power should have produced so little of what are called original researches. He did not often, to use his own phrase, "lapse into a memoir." He seems to have delighted in digging deep on old ground rather than in wandering over the surface of new fields; and perhaps the intensity of mind required for the former kind of work is a higher and rarer gift than that fertile inventiveness of things not far to seek which has characterized some eminent mathematicians. Besides, De Morgan's other interests and occupations must to a great extent have called him away from mathematical researches. In addition to his duties as a professor, he took an ardent interest in logic and mental philosophy, and in the early history of mathematics. On the latter of these subjects he was certainly the greatest authority in the world; and either alone might have sufficed to occupy the whole attention of a less able man. His style has been reproached for its obscurity. The reproach is probably unfounded, and is one which is sure to fall on any writer who rejects that spurious and superficial clearness which is another name for inexactness. What his literary powers were is known to many readers from his delightful *Budget of Paradoxes;* to fewer, perhaps, from the inimitable introduction to *From Matter to Spirit.*

H. J. S. Smith.

THE KARA SEA.

One of the chief practical results of the recent German and Swedish Arctic explorations is that numbers of Norwegian vessels now annually resort to the seas north of Europe, and reap a good harvest in walrus and seal fishery. In 1868 these vessels numbered twenty-five; next year there were twenty-seven, and among them was that of Johannesen, whose voyage round the island of Novaia Zemlia completely overturned all former notions of the conditions of the ice in the Sea of Kara. In 1870 the number of vessels which sailed for the seas round Novaia Zemlia had increased to sixty; and foremost again was Johannesen, who boldly sailed into the icy sea eastward to the mouths of the Obi and Yenisei on the Asiatic coast, and northward to the 77th parallel.

In five of these vessels very careful observations were recorded of the depth and temperature of the sea, the currents, and the state of the ice. From these journals, previously examined and reduced by Professor Mohn, the director of the Meteorological Institute of Christiania, Dr. Petermann has been able to draw up a very complete account of the condition of the whole region

of Novaia Zemlia and the Kara Sea during the summer months.* The observations show that this Mediterranean averages only fifty fathoms in depth, and that it becomes rapidly shallower to northward; but by far the most important discovery, and one which opens up a new and profitable field of industry is this, that throughout the whole of the months of July and August the Kara Sea is perfectly navigable.

Thus the well-directed efforts of the masters of five fishing vessels have opened up a large part of the Arctic Sea. From Scotland there sail annually, and have sailed for perhaps a hundred years, a fleet of well equipped ships, now chiefly steam-vessels, to the seal and whale fishery on both sides of Greenland; but since the early part of this century, when the Scoresbys gained their fame in Arctic exploration, it does not appear that any single observation tending to advance our scanty knowledge of the geography or meteorology of these northern regions has been placed on record by any British whaler. Is it that there are no Scoresbys now, or that such men have nowhere to turn to for encouragement in such work, from which they themselves would reap the greatest benefit? Keith Johnston, Jun.

Scientific Notes.

Geology.

In *Das Ausland* for March 27, Dr. Moriz Wagner gives the first of what promises to be a very interesting and valuable series of papers, entitled *New Contributions to the Darwinian Controversy*. After pointing out that Darwin's theory consists essentially of two portions, Evolution and Natural Selection, he sketches the pre-Darwinian history of the former hypothesis, paying special tribute to the farsightedness of the views of Lamarck and Goethe. The main portion of this article is occupied by a statement of the evidence furnished by geology in favour of the theory of a gradual evolution of organic forms from earlier ones, in opposition to that of special creations. The sudden appearance in palæontology of organic forms strongly differentiated from any earlier ones is always in direct proportion to the amount of disturbance characteristic of the strata in which they are found; the more conformable to one another are two adjacent geological strata, the greater affinity is there in their organic remains. In the more recent formations such suddenly appearing new types do not amount to above 2 per cent of the whole number. Genera of marine animals, as Trilobites, Brachiopoda, and Orthoceras, are found distributed in palæozoic strata over the whole world; while the area of land animals is generally very restricted. Another argument in favour of the derivation-theory is furnished by the affinity of the land animals now existing in any part of the world with those which inhabited the same country at an earlier period, as evidenced by their fossil remains. In the diluvial and pliocene deposits of South America, for instance, are found the remains of Marsupials and Edentata, as armadilloes and sloths, intermediate between those forms which still exist and those which are found in the lower tertiary strata of the same region. The ape-remains again of the bone-caves of Brazil can be assigned to living New World genera, while those found fossil in Europe and Asia belong to existing genera of the Old World. The fossil remains of Mammalia hitherto found in Australia belong exclusively, like the living forms, to Marsupial orders. All these facts are what would be expected were the theory of evolution true, while they would be inexplicable by any doctrine of special creations.

Fossil Mammals from the Secondary Rocks.—There is a society in London, established now for twenty-five years, and doing most excellent work, yet whose very existence is to a great extent unknown. We refer to the Palæontographical Society, which owes its origin, in 1847, to a gathering of some half a dozen geologists, called the "London Clay Club." This society aims at accomplishing for palæozoology what the "Early English Text Society" and other kindred bodies have undertaken for palæohistory, namely, to illustrate and describe the ancient plants and animals whose remains are found in the various strata composing our islands. With this object in view, twenty-four large volumes have already appeared, containing 6769 pages of letterpress, and 1044 plates of fossil remains. The last of these volumes, just issued, deserves special attention, as it contains, besides plants, Echini, Lamp-shells, and Eocene Mollusca, a complete monograph, by Professor Owen, on Fossil Mammals, from the Secondary Rocks. The interest attaching to these remains is very great indeed, as they represent in past time, however humbly, that type of the animal kingdom in which man is placed. The earliest evidence of a mammal as yet met with was found by Plieninger in the Keuper or Rhætic of Würtemberg. Similar remains have also been discovered in Somersetshire by Mr. Charles Moore, F.G.S., of Bath, and Mr. W. Boyd Dawkins, F.R.S. These consist of detached teeth only of an exceedingly minute Marsupial animal called *Microlestes*, which was probably insectivorous in its diet. Following these, but vastly higher up geologically, we come to three other genera in the Stonesfield slate near Oxford, represented by lower jaws, also exhibiting the dentition of Marsupials. Lastly, at the top of the Oolites, we meet with eleven genera and twenty-seven species in the Purbeck Freshwater Limestone of Durdlestone Bay, Dorsetshire, all collected by Mr. S. H. Beckles, F.R.S., and represented by a series of jaws and teeth equally minute, and belonging also to Marsupial types. As to the interpretation put on certain of these remains by Professor Owen, much difference of opinion has been expressed, first by the late Dr. Falconer, and since by Professors Busk, Flower, and Mr. W. Boyd Dawkins, the author re-asserting his conclusion that *Plagiaulax* was a carnivore, although so small in size, whilst the late Dr. Falconer and others argued against its carnivorous and in favour of its vegetarian diet. With the question of *Plagiaulax* has also been associated that of *Thylacoleo carnifex*, the extinct Marsupial tiger of the Wellington Caves, N. S. Wales, which Busk, Flower, Boyd Dawkins, and Gerard Krefft consider not a true carnivore, whilst Owen asserts it to be the fellest and most carnivorous of its order.

Ceratodus Forsteri.—The number of the *Annals of Natural History* for March contains two papers on this curious Australian fish, which has excited so much interest among naturalists from its apparent relationship to the extinct fishes of very remote geological periods. Messrs. Hancock and Atthey consider that the fish has probably nothing to do with the genus *Ceratodus*, which appears to belong to the Selachii. They regard the so-called *Ceratodus Forsteri* as most nearly allied to *Dipterus* and *Ctenodus*, genera of Cycloid Ganoids. They also recognise its near affinity to *Lepidosiren*, which is particularly pointed out by Dr. Günther, the author of the second paper, who describes the structure of the recent fish, and also recognises its resemblance in the microscopical character of the teeth to the extinct genera *Dipterus* and *Psammodus*. From his investigations he is led to the opinion that the Dipnoi (including the so-called *Ceratodus*, *Lepidosiren*, and *Protopterus*) cannot be separated as a sub-class from the ganoid fishes, but that they form a sub-order (order?) of Ganoids, which he characterises as follows:—"Ganoid fishes with the nostrils within the mouth, with paddles supported by an axial skeleton, with lungs and gills and notochordal skeleton, and without branchiostegals." He includes *Dipterus* (which he identifies with *Ctenodus*) in this group. He also proposes to unite the Ganoid and Chondropterygian fishes into one sub-class, Palæichthyes, which he characterizes as follows:—"Heart with a contractile bulbus arteriosus; intestine with a spiral valve; optic nerves non-decussating."

Chemistry.

The Breitenbach Meteorite.—This aërolite, which belongs to the siderolite class of meteorites, was found in 1861, at Breitenbach, in Bohemia. It bears a great resemblance to the meteorites of Steinbach and Rittersgün, and probably formed part of a great aërolitic shower which fell over the region extending from Meissen to Breitenbach. In a memoir of this meteorite (*Proc. Royal Society*, xix. 266), Professor N. Story-Maskelyne describes it as consisting of a mesh of nickeliferous iron, enclosing within its hollows two silicious minerals. The first of these is a bronzite of a bright green colour, with the formula $Mg\frac{3}{4}Fe\frac{1}{4}SiO_3$, and crystallized in the orthorhombic system. The other mineral is silica, having the specific gravity of quartz after fusion, and crystallized in the orthorhombic system. Such a result is of no small interest, since from the fact that the tridymite of Professor vom Rath has been shown to be hexagonal in its symmetry, this mineral of the Breitenbach meteorite is a trimorphic form of silica. The elements of the crystal are $a : b : c = 1{\cdot}7437 : 1 : 3{\cdot}3120$, and the angles $100 : 101 = 27° 46'$, $100 : 110 = 60° 10'$, $110 : 101 = 63° 19'$. The optic axes lie in a plane parallel to plane 010, the first mean line being the normal to the plane 100; they are widely separated, presenting in air an apparent angle of about 107°. The specific gravity of the new form of silica is 2·245, that of vom Rath's tridymite being from 2·29 to 2·3, and that of quartz 2·65. The nickeliferous iron, the chief constituent of the siderolite, proved on analysis to be an alloy of the formula $Fe_{10}Ni$, with a trace of copper. In addition to these two minerals, the iron encloses occasional crystals of chromite in well developed octahedra, some troilite (iron monosulphide), and a small amount of schreibersite.

Solid Carbon Disulphide.—M. Ballo has endeavoured to solve the question (*Berichte der Deutschen Chem. Gesellschaft zu Berlin*, 1871, No. 2) whether the body arising from the rapid evaporation of the sulphide is due to the actual freezing of this body, or is a combination of it with water. By carefully removing all the moisture from the atmosphere in which the evaporation took place, he found the formation of the snow-like substance was reduced to a minimum, and the results of his analyses of the solid product, formed under ordinary conditions, led him to the view that it is in reality a hydrate of the formula $CS_2 + H_2O$, which contains 19·14 per cent. of water.

* *Mittheilungen*, iii. 1871.

New Blood Crystals.—According to Dr. Preyer (*Chemisches Centralblatt*, No. 7, 1871) the addition to an aqueous solution of blood, from which the chlorine has been removed by argentic nitrate and subsequent filtration, or to an aqueous solution of pure hæmoglobine, of an equal volume of ether and a little glacial acetic acid, causes the ethereal layer to turn dark brown and to exhibit four absorption bands, one between C and D (the acetic acid band), which lies close to C, a very weak one near D, a strongly marked broad one at E, and another strongly marked one between *b* and F. A similar spectrum, which was first observed by Stokes, is also given by the hæmatine, that contains no iron. Preyer has found that the colouring matter of the above solution can be crystallized, if the ethereal layer from the colourless hæmaglobine solution or the blood freed from chlorine be separated, very slowly evaporated, and finally dried over potash solution. The crystals are for the most part acicular, frequently contorted, sometimes in stellar aggregation, sometimes detached. The majority are finely pointed, many show jagged edges. They doubly refract light, surpass in size all other blood crystals, are insoluble in ether, alcohol, and water, but readily dissolve in potash solution of aqueous acetic acid, and can be recrystallized from the last-mentioned menstrum. They are not identical with hæmine or hæmatoidine, nor apparently with Lehmann's hæmatin crystals. They have received the name of hæmatoine.

Fluoride of Silver.—Mr. Gore has found (*Proc. Royal Soc.* xix. 235) that argentic fluoride is only superficially decomposed by chlorine at 60° F. in 38 days, and at 230° F. was but slightly acted on in 15 days; heated to a red heat in platinum vessels it is entirely decomposed in accordance with the following equation:—

$$4AgF + 4Ce + Pt = 4AgCe, PtF_4.$$

An aqueous solution of the fluoride, when treated with chlorine, evolved oxygen. At temperatures below 200° F. the action of bromine on the fluoride resembled that of chlorine; at a low red heat complete decomposition of the silver salt occurs, a portion of the fluorine being liberated and an insoluble fluoride of platinum and bromide of silver being formed. The reactions of iodine were in most respects like those of chlorine and bromine.

Guanidine.—Erlenmeyer some years since formed guanidine by the ultimate action of ammonia on chloride of cyanogen, the intermediate product being cyanamide. A. Bannow (*Berichte der Deutschen Chem. Gesellschaft zu Berlin*, No. 3, 1871) has investigated the action of iodide of cyanogen on ammonia, and finds that it is directly converted with the greatest ease into guanidine hydriodide. By digesting the iodide for three hours in the water-bath with three times its weight of alcoholic ammonia, of 10 per cent., the odour of the iodide completely disappears, and the colourless contents of the tube furnish on evaporation nearly the theoretical amount of almost pure guanidine salt.

Miscellaneous.

Kingfishers.—Mr. R. B. Sharpe, Librarian to the Zoological Society of London, has now completed his *Monograph of Kingfishers*, and it is seldom that we have to notice a work of this nature that leaves so little to be desired. It is of a handsome yet portable quarto size, and every known species of these beautiful birds is represented by well coloured figures, which have been drawn with great spirit by M. Keulemans, and which will not suffer by comparison with the very best of those in Mr. Gould's folios. Besides the plates, there are careful descriptions of the several species; and in a well studied introduction the classification, affinities, and geographical distribution of the family are fully discussed. Kingfishers have many points of special interest. They are exceedingly isolated, having no near allies whatever; as may be well understood when we find that the very different-looking Hornbills are supposed to be their nearest relations. They are also most curiously distributed over the earth; for, though found in every country, yet in the region which of all others abounds most in rivers and in fish (South America) they are least plentiful. Had the author not told us in his preface, no one would have suspected, that this was the first production of a young naturalist; for the book is so carefully done that it will take rank as a standard authority on the group of birds of which it treats, while it is at the same time so well got up as to form a most beautiful and attractive ornament for the drawing-room table.

Spanish Forests.—The question of Forest Conservancy has especial importance for Spain, and the work just published at Madrid, on this subject, by the eminent engineer Don Francisco Martino, furnishes very full information respecting the proceedings of his department in Spain during the last ten years. It appears that a corps of forest engineers has been at work since 1854, and a periodical called the *Forest Review* has reached the third year of its existence. The forest engineers, in spite of much discouragement and want of necessary support and aid from the government, have achieved good results in various parts of Spain, by checking abuses and introducing scientific methods of treating the woods and forests. They have also submitted many valuable reports on subjects connected with their department.

The publication is announced of the *American Archæological Review and Historical Register*, to be devoted to archæology, anthropology, and history, with especial reference to that country. The editor, Mr. Wills de Hass, offers as a guarantee of his ability for the task his "thorough and systematic researches in the vast mound-field of the Mississippi Valley," and promises "besides original contributions, a comprehensive *résumé* of the latest foreign enquiries and research, a condensed sketch of the progress of discovery in all parts of the globe," together with "critical reviews and bibliographical notices of new publications on archæology, ethnology," &c. There can be no doubt that such a publication is needed in the United States. The *Review* will appear quarterly or monthly, according to the support it receives.

The *Medical Annual* published by the Medical Society of Vienna has appeared this year under a new form. It is now edited by Professor Stricker, who intends it from henceforward to be devoted almost entirely to the recording of laboratory work, instead of clinical observation as heretofore. Clinical observations, however, which have a special scientific interest will still be admissible. From a note by the publisher, M. Braunmüller, we gather that the publication is to be regarded as a continuation of Professor Stricker's well known *Studien aus dem Institute für experimentale Pathologie*, which appeared in 1869. Four numbers will appear yearly. The present number contains an introductory paper by Professor Stricker entitled "Pathologie und Klinik," two interesting papers on the cornea, three on inflammation of tendons, lymphatic glands, and bone respectively, a paper on pyæmia, and several others.

A new series of the *Messenger of Mathematics* will be commenced on May 1st, under the editorship of W. Allen Whitworth. M.A., Fellow of St. John's College, Cambridge; C. Taylor, M.A., Fellow of St. John's College, Cambridge; W. J. Lewis, B.A., Fellow of Oriel College, Oxford; R. Pendlebury, B.A., Fellow of St. John's College, Cambridge; J. W. L. Glaisher, B.A., Scholar of Trinity College, Cambridge.

History.

Rome and the Campagna. A Historical and Topographical Description of the Site, Buildings, and Neighbourhood of Ancient Rome. By Robert Burn, Fellow and Tutor of Trinity College, Cambridge. Deighton and Bell.

Rome has always had peculiar attractions for the people of Northern Europe, and some of the earliest guidebooks were composed for their use. Dante speaks (*Parad.* xxxi.) of the barbarians of the North as looking up at the mighty buildings with astonishment and awe. John Capgrave, a Norfolk man who compiled the *Legenda Angliae*, also wrote a description of Rome, of which a fragment has been preserved to our own times. A strange name and a stranger legend is usually attached to each building: it is needless to say that the age of scientific archæology had not begun. When William of Malmesbury comes to the First Crusade he cannot resist the temptation to give his readers a long description of the Great City, with an introductory poem by Hildebert of Le Mans. His idea is to take the circuit of the walls, and pausing at each gate to notice the most sacred shrines in the neighbourhood. The Romans themselves naturally followed the plan of describing the "Regions" into which Augustus had divided the city; a modern naturally somewhat modifies this idea, as the boundaries of the Regions are now by no means clear. It is easier, after describing the line of the walls, to sketch the public buildings in or around each of the Fora, and then to give a separate account of each hill, and of the Campus Martius which lies at their feet. Mr. Burn has adopted this arrangement, and prefixed to it a description of the site and geology and early history of the city, and added at the end some notices of the Campagna. A special feature in his work is the full account of the great villas of the imperial time, when the

early cities had perished, and Latium was divided among a few rich owners, when Pliny could say "latifundia perdiderunt Italiam." The Villa of Hadrian near Tibur occupied the space of an ordinary Italian town eight miles in circuit, and contained within itself a circus, three theatres, huge thermæ, an imitation of the vale of Tempe, of Tartarus, and of the Elysian fields. This part is admirably done, and it is most appropriately closed by an account of the period of devastation during the barbarian invasions. It is a subject of regret that Mr. Burn was not able to survey the Campagna as thoroughly as he has done Rome.

The earliest walls in Rome are built of the reddish-brown volcanic tufa which forms a large part of the hills. The earliest building is the old well-house of the Capitol, called the Tullianum, roofed by overlapping horizontal blocks which formerly met in a conical point, in a way very like the well-known gate of Mycenæ, or the Celtic beehive huts, some of which still survive in the West of England. Mr. Burn has not gone so far back as the Stone Age in his enquiry, though it has lately been made the subject of some interesting researches in Rome, of which an account is given by Mr. Chermside in *Macmillan* for September, 1867. Yet he has begun before the strictly historic ages. The round arch, the glory of Roman architecture, is of later, perhaps Eastern, origin — certainly not derived from the Greeks, who made little or no use of it. Hellenic architecture had no upper floors or stories, and therefore necessarily occupied a large area. The Roman population was closely crowded together, and the bearing power of the arch was of the highest importance. It seems to have been first used in the Cloaca Maxima, and it is no slight confirmation of Livy's statement which ascribes the Cloaca to the Etruscan dynasty of the Tarquinii that a precisely similar work occurs at the mouth of the Marta, the river on which the city of Tarquinii stood. The specus of the Aqua Appia lately discovered near the Porta Maggiore is not arched over, but has a gable-shaped covering formed by two flat stones inclined at an acute angle to each other. The aqueducts, however, are purposely varied in form that they may be the more easily recognised where they emerge from underground passages, an important point for engineers to know at once, when the aqueducts were so numerous and their course so complicated. It was not till a late period however that the arch was used to bridge over the spaces between columns so as to change colonnades into arcades (as in the palace of Diocletian at Spalatro); and the Romans never seem to have taken that step in advance, afterwards made by the inventors of Gothic architecture, the development of the *decorative* capabilities of the arch. From Etruria too came the use of brickwork, a mode of building facilitated at Rome by the abundant beds of excellent clay to be found on the western bank of the Tiber, and by the unrivalled mortar made from the granular tufa mixed with lime. A geological map of Rome is given by Mr. Burn, presenting a very clear view of the general relation of the strata; the two masses of hard tufa which form the two peaks of the Capitoline Hill (with the similar bosses on the Aventine and the Cælian) stand out distinctly from the granular tufa of the other hills, and the marine formations of the Vatican and Janiculan on the other side of the river—while up into every valley runs the freshwater alluvial soil (the Argiletum or "clay-bed") dating from the time when the Tiber formed a lake-like sea among the Seven Hills; the memory of which may be said to be recalled by its frequent floods, such as that which Horace commemorates, or that from which Rome has been lately suffering—the very legend of Romulus the founder describes a similar event. The use of concrete began under the later Republic, but the strange fragment called the Muro Torto at the corner of the Pincian Hill is probably later than Sulla's time. The visitor to Rome is at once struck by the fewness of the remains of the republican time, in which he naturally feels most interest; there is nothing that can rival the remains at Athens of a similarly early age. It is even difficult to recognise the Seven Hills, so covered are they with the wreck of buildings which has partially obliterated the hollows between, though perhaps hardly so much as has been the case at Jerusalem. Even lately the masses of earth taken by Rosa from the Palatine and thrown into the valley beneath have covered the old breathing holes or wells which descend into the specus or conduit of the Aqua Appia. In treating of the early history, Mr. Burn discusses Rosa's view that the Palatine once consisted of two heights with an Intermontium, exactly like the Capitoline Hill, and justly remarks that the excavations hitherto do not seem to bear out this view. In speaking of the Porta Capena no mention is made of Mr. Parker's theory as to its site, and in several places Mr. Burn seems to lean on the whole against the results which the former believes to have been obtained by his recent excavations. In p. 219, the idea that *Spem* in four passages of Frontinus is a manuscript abbreviation of *Specum* is not accepted by our author. In fact, Mr. Parker's enthusiasm for his favourite aqueducts, to whose history he has contributed so much good service, has in this instance carried him too far. A temple of Spes (Vetus) is mentioned as early as Livy, 2, 51, in a battle fought some little way out from the Porta Esquilina. It occurs also in the *Historia Augusta*, in the Life of Heliogabalus, ch. xiii. This was a district of gardens, and Spes was a sort of garden goddess, *i. e.* Hope of the autumn fruit, &c. There was a shrine of Quies on this same road (Livy, 4, 41), which led to Lavici, and along which much fighting took place, this being the natural road by which the Æqui would advance. In the account of the imperial Fora we are much struck with the utter want of correspondence between modern and ancient Rome. For instance, in the map to chapter vii. the modern streets are shown running across the ancient buildings in all directions. The popular thermæ and amphitheatres partially survive, but the temples of the gods and the Fora of the emperors have nearly disappeared. The ruins of two fragments only of the Forum of Julius Cæsar have been discovered; hardly a stone is left of that of Vespasian, though the Templum Pacis, in which the golden table of shewbread and the golden candlestick were deposited, was esteemed one of the finest and greatest buildings in the world. Trajan has been more fortunate in the preservation of his famous column. Mr. Burn rejects the view that the ground cut away was of the same height as the column, since this would make it out to have been a ridge higher than the Capitol. For the accurate photographs recently taken of the column we may refer to a late number of the *Academy*.

In the description of the separate hills, the Palatine and Capitol naturally take the foremost place. As to the leading question, viz. which of the two peaks of the Capitoline was the fortress (arx), and which the Temple of Jupiter Optimus Maximus, Mr. Burn takes the German view, which places the temple on the S.W. height, nearest the river. Mr. Dyer, in his well-known article (since reprinted) in Smith's *Dictionary*, had taken the other or Italian view. This internecine struggle (it has almost become of national importance) will never be finally ended until excavations are allowed on a sufficient scale, when the foundations of the great temple will be found. At present the evidence seems to favour the German view. Unfortunately all the words used for the separate peaks, *e. g.* Mons Tarpeius, Arx, Capitolium, are also used vaguely for the whole hill. Yet the

incidental notices in Livy seem to show that the temple was on the river side. The Gauls climbing up by the Tarpeian rock waken the sacred geese of Juno—this must refer to the shrine of Juno, which was next to that of Jupiter in the Triple Temple. And so such expressions as 6, ch. xvii.—*ipso paene Jove erepto ex hostium manibus*. There were probably no houses on this sacred ground. The house of Manlius was on the Arx, *i. e.* the northern hill, and on its site after his condemnation a temple was built to Juno Moneta—"Juno the Warner" (Moneta is one of the participles once active). In treating of the Quirinal, p. 250, Mr. Burn seems to speak of the treaty between Tarquin and Gabii as still in existence in Augustus' time. It can have been no more than a restoration; and Mr. Burn can hardly believe in the relics of Tanaquil preserved in the same temple of Sancus, her sandals, spindle, distaff, and bust. In another place he notices the Regia as having escaped the burning of the city by the Gauls, but one does not see why: the preservation of the houses on the Capitoline will account for some early records being saved. In p. 314 he refers to the *Apollinare* which Livy mentions 3, 63; possibly the correction "Apollinis aream" may be accepted (like Area Vulcani, &c.). In p. 359 there is no notice of Mr. Parker's solution of the question as to the double course of the Almo. In p. 441, the mention of the Fratres Arvales is very slight, considering the importance of the inscriptions concerning them lately discovered. In p. 387, Niebuhr's conjecture as to the passage of Livy 2, 39, which describes Coriolanus' conquests is not given, viz. that "in Latinam transgressus," has slipped out of its place between "deinceps" and "Corbionem," which would make Coriolanus first conquer the towns south of the Appian, and then those north of the Latin road, *i. e.* really representing the Volscian and Æquian conquests respectively. Perhaps there is hardly account enough given of the aqueducts and of the catacombs, but we may hope that Mr. Burn will be able some day to perfect his account of the Campagna. It has been difficult of late to explore the country beyond Rome, and we are grateful for the scholarly thoroughness with which Mr. Burn has done his work within the city. The maps and plans are excellent, and a good map is often the best commentary. Such a work has in part the interest of a discovery, and Roman history has no slight charm added to it by being studied at Rome. C. W. Boase.

Savonarola, Erasmus, and other Essays. By Henry Hart Milman, D.D. Murray.

These essays on ecclesiastical subjects not falling within the scope of his "Histories," have been selected from the *Quarterly Review* as a just tribute to the deservedly high reputation of the historian of Latin Christianity. Five are biographical and historical sketches; those on "Newman's Theory of Development," and the "Relation of the Clergy to the People," are of a controversial character. The closing article of the series, "Pagan and Christian Sepulchres," which is also Dr. Milman's last contribution to the *Review*, is founded on the Cav. di Rossi's great work. But the Dean treats this interesting subject with the added authority of an eye-witness, as, during a visit to Rome, he had himself explored many of the principal catacombs under Di Rossi's own guidance. The opening essay may, we think, rank as the masterpiece of the volume. With consummate skill all the details of Savonarola's career are set before the reader; the slow dawn of his intellectual powers and moral influence, the growth of his political ascendancy, the gathering hatred of his civil and ecclesiastical foes, their final triumph over him, and the pathetic and terrible history of his death. And, coming from Dean Milman's pen, it is almost needless to add that the narrative is enhanced by vivid and picturesque description and the charm of a brilliant and vigorous style. The sketch presents a few inaccuracies which would probably have been avoided had Villari's *Life* appeared prior to its publication. Fra Girolamo's career is perhaps treated too much as an isolated phenomenon; the religious history of Italy furnishes two examples of church reformers, Arnold of Brescia, and John of Vicenza, whose actions and fate closely resemble those of their Florentine successor. One point in the treatment of the subject deserves notice. As the religious reformer, as the bold denunciator of the infamous Alexander VI., Savonarola calls out the Dean's loftiest sympathies. But he has no sympathy whatever with the friar as champion of the liberties of Florence. Under this bias, instead of attributing his hostile attitude towards Lorenzo to its obvious cause—the fact that he looked upon him as usurper over the city's freedom—Dr. Milman sets it entirely down to "the rigour and intolerance of monkhood," which could brook no alliance between Christianity and classical culture. This view also leads him to refuse belief to the received account of the Dominican's final interview with Lorenzo. That scene, as recorded by Villari, once read, is not easily forgotten; Lorenzo's troubled confession of his political crimes, his reluctant vow to restore all ill-gotten gains, his agony of desire for Fra Girolamo's absolution; the stern patriot keeping back the spiritual boon save at one price—"freedom for Florence," the dying prince's gesture of refusal, and Savonarola's silent withdrawal. This highly characteristic narrative rests on the evidence of three contemporaries, one of whom, Pico, was Lorenzo's personal and intimate friend, yet the Dean rejects it for the colourless and unsupported version of Politian, a thorough-going partisan of the Medici family. The sketch of Erasmus is full, genial, and appreciative; the witty satirist of folly and superstition, the unwearied promoter of classical learning, the lover of peace in an age of internecine conflict, is described with affectionate sympathy. The examination of the motives and conduct of Clement XIV. in his suppression of the Jesuits is undertaken for the purpose of justifying that pontiff. Dean Milman inclines to the opinion that Clement was not carried off by poison, but avoids a decisive verdict upon the question.

One spirit pervades this volume, that of moderate ecclesiastical conservatism, which specially expresses itself in fear and dislike of thorough-going emphasis in thought and opinion. The writer's polemical attitude seems due in part to his dread of those sympathies with the teaching and practice of Rome which, at the time the essays appeared, the Tractarian movement was developing in the Church of England. This feeling, which underlies the whole book, strongly characterizes the critical handling of Dr. Newman's treatise on Development. Dean Milman's weakness as a controversial writer arises, we think, from precisely the same defect which Shelley points out in Wordsworth. He wholly lacks the power of putting himself into an intellectual or moral position other than his own. The article on Newman's book and that next following exhibit this mental condition as much interfering with a thorough perception of the state of the argument, and also as fatal to the power of psychological analysis—an essential element in religious criticism. In the "Relation of the Clergy to the People" a comparison is instituted between the sacerdotal theory of Rome and that of the Anglican Church. The Dean's ideal upon this subject will appear to a large and zealous section of the Church of England somewhat secular; all spiritual distinctions marking off the priesthood from the laity are denied; nothing is left to the clergy beyond a purely moral

influence and those social advantages for doing good which they enjoy as a body of carefully educated teachers, on whom State recognition and State support confer dignity, independence, and leisure for their allotted work. The tone of both essays is always calm and moderate, and taken for manifestoes of opinion put forth by a finished representative of his party, they have sterling value as contributions to the history of religious thought in this country. A future student of that history may note with some curiosity that so thoughtful a theologian could in 1846 have regarded Rationalism as a passing and superficial phase of opinion against which a "triumphant reaction" had already set in (p. 302). Perhaps the serene and equable atmosphere of belief which necessarily surrounds a Church dignitary is disadvantageous to the theological critic. It must be difficult for him to give their just proportions to the two antagonistic forces—religious doubt and religious enthusiasm—which distract or hurry away the minds of ordinary men. In the "Popes of the Sixteenth and Seventeenth Centuries," with great mastery of his subject and equal mastery of language, Dr. Milman has given an analysis of Ranke's work. He follows that author through the long procession of popes, bestowing on each his due share of notice, determined by the significance of personal character or of public action. Among them all Sixtus V. especially attracts the writer, whose admirable delineation of the strong upholder of the temporal power raises our regret that the later investigations of Baron Hübner were not open to him in place of Leti's fictitious and Ranke's imperfect sketch. A passage from the examination of the causes which brought on the Romish reaction of the sixteenth century may serve as a specimen of Dr. Milman's views and of his style.

"But the strength of the papacy was in its own reviving energy and activity. It had armies at its command, more powerful than the men-at-arms of Alva, or the chivalry of the Guises. For home or foreign service it had its appropriate and effective forces. It had its stern and remorseless police in the Dominicans, who administered the inquisition in Italy and Spain; men of iron hearts, whose awful and single-minded fanaticism bordered on the terrible sublime—for they had wrought themselves to the full conviction that humanity was a crime when it endangered immortal souls: the votaries of the hair-cloth and the scourge, the chilling midnight vigil, the austere and withering fast; those who illustrate the great truth that men who proscribe happiness in themselves are least scrupulous in inflicting misery; whom one dark engrossing thought made equally ready to lay down their own lives, or to take away those of others."

We do not forget that Ranke's volumes have also served Macaulay as a text-book. It is curious to observe the very opposite way in which the two representative writers of the *Quarterly* and of the *Edinburgh Reviews* look at the same subject. One point of difference will sufficiently illustrate the striking contrast. The popes, as individuals, have not arrested the attention of the great Whig essayist, but he gives us one grand masterly portrait—that of the man who was at once the keystone and the type of Catholic reaction. Lord Macaulay's imagination was fascinated by Ignatius Loyola; in Dean Milman's eyes he is simply "the half insane founder of Jesuitism" (p. 227). George Waring.

THE HISTORICAL MSS. COMMISSION.—II.

There is every reason to believe that the great public interest created by the First Report of the Royal Historical Commission will be even more stimulated by the publication of their Second Report. During the year 1870, 101 collections belonging to individuals and public bodies have been examined and reported upon, and most valuable results have been obtained. Owing to the operations of the Commission some important sets of papers have passed or will shortly pass from private into public hands, while others have been placed in the Record Office for public use.

The Earl of Dalhousie has resolved to print the "Registrum de Panmure"; the Early English Text Society will print the Marquis of Lothian's Anglo-Saxon Homilies of the tenth century, and has printed from an edition, supposed to be unique, of Lyndesay's Minor Poems in Lord Mostyn's collection; the Camden Society has issued a selection of letters and papers from Mr. Fortescue's collection. At the instance of the Commission the papers belonging to the House of Lords are now being calendared and arranged; among these, the documents dated between 1629 and 1640 are especially interesting and important. It is thought that the Shelburne papers now at Lansdowne House may include important documents relating to the political history of the latter half of the eighteenth century, and may illustrate the causes of the fall of the Shelburne Ministry, and the Fox-North Ministry in 1783, and those of the composition of Pitt's first cabinet. Among the Earl of Bradford's papers is the valuable correspondence of Lord Torrington while he was ambassador at Brussels from 1782 to 1792. Countess Cowper's collection at Wrest Park includes a fine copy (about 1400) of Higden's *Polychronicon*, an English Brut Chronicle, fifteenth century, and a French version, two cartularies—that of Croyland Abbey, important because the compiler ignores the early charters cited by Ingulphus; four volumes of original works by Wyclif, &c.; and also interesting political memoranda by Lords Grenville and Grantham, from 1761 to 1769. Earl Spencer's MSS. contain most important historical materials; among them are autograph notes by the Marquis of Halifax, of his conversations with William III., the journal of the voyage of Robert, first Lord Spencer, who carried the Garter to Frederic, Duke of Würtemberg, in 1603, and a large body of letters illustrative of politics and society during the sixteenth, seventeenth, and eighteenth centuries, chiefly written by the most distinguished men and women of those times; among them is an original letter by the Prince of Orange (17th December, 1688) to the Marquis of Halifax and two other peers, to advise King James to go to Ham, where he shall be safe. English history from the reign of Charles I. to the Revolution will have much light thrown upon it by papers belonging to the Earls of Mount Edgcumbe and Dartmouth; in the latter collection the political correspondence during 1688 is very extensive, and includes original letters by James II. and William of Orange. Lord Wrottesley possesses among many interesting documents an original deed of composition under the dictum of Kenilworth; no other of the kind is known to exist. The collections of Lord Lyttelton, Sir H. Dryden, and Mr. W. R. Baker are rich in letters by celebrated authors of the eighteenth century, Voltaire, Pope, Addison, Johnson, and others. Among the MSS. of the Puleston family are "A Bouche of Court," presenting minute details concerning the officers and household of Henry VIII., an elementary Latin grammar, by John Leylonde, fifteenth century, and other documents, legal and historical, some relating to the Civil War. Colonel M. Biddulph possesses a MS. Chronicle of Wales, sixteenth century; and Mr. R. Corbet, of Market Drayton, documents of local interest. Mr. W. B. Davenport has many pieces of literary interest; among these are a document possibly referring to Shakespeare, an unpublished letter and poem of Ben Johnson, and a poem by Marten the regicide. In the collection of C. C. Dormer, Esq., of Ronshan, are letters of Sir P. Sidney, and Catherine, Countess of Suffolk, to Leicester, as well as of the Royal Family during their exile, under the Commonwealth, and the journals of Mr. C. C. D.'s ancestors, masters of the ceremonies in the English Court during the seventeenth and eighteenth centuries. Mr. J. R. Ormsby Gore has the letter-book of Rich. de Bury, Bishop of Durham, *temp.* Edward III., a fifteenth-century volume of English poems, English tracts on ecclesiastical and social subjects, *temp.* Henry VIII., Higden's *Polychronicon*, and numerous original letters from Charles I. and several of his principal adherents during the Civil War. Mr. H. B. Mackeson has many documents relating to the town of Hythe. To the Nevilles of Holt belong a letter of Walter, Archbishop of Rouen, twelfth century, an original letter describing the ravages France underwent through Henry V.'s invasion, a deed giving a new fact for the life of William of Wykeham, and other papers of interest. Mrs. Prescott has letters, partly original, by Oliver Cromwell and members of his family, with Morland's original account, submitted to him, of the expenditure of money raised for the Vaudois; Mr. Rogers, of Penrose, papers connected with the Civil War and Monmouth's rebellion. The Peniarth collection

belonging to Mr. Wynne, about 600 vols., contains early copies of the histories of Beda and Henry of Huntingdon, later copies of Alfred of Beverley and Nennius; large collections for Early English and Welsh history; the original duplicate signed by Francis I. of France, of a treaty between him and Henry VIII. against the Turks; copies of State Papers, *temp.* Elizabeth; a transcript of Leland's Commentaries, which will supply the blanks in Hearne's edition; thirteenth-century copies of thirty-five charters by Anglo-Saxon kings, from A.D. 800 to 1048; a Cornish mystery play (1508); English and Welsh copies of the Brut Chronicle; very early transcripts of the Welsh laws; and an unpublished letter by the Earl of Mar (1717) on a projected Jacobite invasion. A volume in the Chetham Library presents valuable material for the civil and ecclesiastical history and topography of Ireland. Lord Camoys possesses among his MSS. "The Ladder of Perfection;" Hilton's translation of S. Bonaventura's "*Stimulus Amoris; Amor Dei*, or the Love of God;" and Richard Hampole's "Prick of Conscience." In Lord Wardour's remarkable collection of MSS. a series of household rolls exists, illustrating the history of prices in England from the reign of Edward III. to Elizabeth, and supplying particulars connected with the progress of art, commerce, architecture, &c. Miss Ainslie's MS. volume contains articles valuable for the early history of the City of London; Mr. Berington's collection includes a mass of correspondence connected with private family history from the beginning of Elizabeth's reign up to the present century. His papers concerning the council of Prince Arthur are especially noteworthy. Mrs. Collis's MSS. include a supposed unique, "The Order of Common Prayer," used in the English congregation at Frankfort. Two MSS. relating to the English Benedictines at Ampleforth College are worth attention. Among the important MSS. at Stoneyhurst College are a short Anglo-Saxon poem, a poem on the Passion, Hilton's treatise on Contemplation, pieces in prose and verse by Chaucer, Bishop Alcock, and others, a curious Latin-English dictionary, copies hitherto uncollated of Froissart (first volume), Henry of Huntingdon, of the taxation of England by Pope Nicholas IV., also a sixteenth-century act book of the commissary of Whalley Abbey, exhibiting the moral and social condition of the district, and volumes illustrative of art and church ritual. Colonel Carew possesses a tenth-century copy of the Gospels with lectionary; after which comes a copy contemporary, or nearly so, of Archbishop Fulco's letter to King Alfred; Dr. Hoskins has a set of MSS. relating to Jersey. The collection in the Cathedral Library, Carlisle, chiefly concerns ecclesiastical matters and border history. The ancient Minute Book (Register) of Clare College, Cambridge, claims notice; it has also a valuable collection of letters, among others from Tillotson, Pearson, and Saunderson. Caius College has its MS. history written by Dr. Caius, and an interesting Computus beginning in 1423; Jesus College possesses, *inter alia*, the Computi of the Nunnery of St. Radegund, and Trinity Hall letters from Queen Elizabeth, Bacon, and others, and memoranda respecting Herrick. The Computi of Exeter College, Oxford, are probably some of the earliest in that University; its ancient deeds and charters throw light on early collegiate and civic history; the Registers of Lincoln College present curious details as to college life in the first half of the seventeenth century; the Computi of Oriel and Queen's matters of antiquarian interest—the latter has the Chartulary of the Hospital of St. Julian, Southampton. The early household books of New College throw light on social customs at the close of the fourteenth century; it possesses an autograph letter by William de Wykeham, the only specimen of his writing beyond his signature which has come down to our times. Worcester College has, besides the registers, containing interesting entries, of its predecessor on the site, Gloucester Hall, a MS. register of the town of Leslie, in Fife, A.D. 1606–45, and a folio MS. giving an account of Archbishop Laud's trial, which may disclose fresh facts. The inventory of effects of Viscount Lisle—John Dudley, Duke of Northumberland, beheaded 1553—throws light on the internal economy of a peer's London house in the middle of the sixteenth century, and includes a list of the library. The Petyt MSS. in the library of the Inner Temple, owing to their bulk, have not been thoroughly examined. They appear illustrative of English political and religious history in the reigns of Edward VI. and Elizabeth. The corporation of Abingdon possesses documents relating to its domestic history in the latter half of the sixteenth century.

Lord Edmund Fitzmaurice has reported on MS. volumes of Irish parliamentary debates between the years 1776 and 1789, belonging to Mr. W. M. Torrens, M.P., which supply new materials for Irish parliamentary history, no debates hitherto published dating earlier than 1782; he has also described a collection of MSS. belonging to Mr. Harvey, of Ickwell Bury, and called attention to another in the possession of Sir Charles Dilke. Mr. Fraser reports on the highly important muniments belonging to the Duke of Montrose. They include charters from King William the Lion, and subsequent Scottish sovereigns to successive representatives of the family of Graham. The papers relating to the first Marquis of Montrose embrace the correspondence with him of Charles I. and II., Queen Henrietta Maria, Elizabeth Queen of Bohemia, James Duke of York, Prince Rupert, Prince William of Orange, and others. The letters of Charles I., which are nearly all holograph, were written from various places during the Civil War, and show the great difficulties in which the king often found himself. The correspondence of his sister, Elizabeth of Bohemia, is marked by her characteristic wit and vivacity. The papers connected with the trial of Montrose and his companions, the depositions of witnesses concerning his invasion of Scotland, and the battle of Tippermuir in Perthshire; the petitions of the Ecclesiastical Courts for the execution of his imprisoned adherents; the acts and proceedings of the Privy Council and the Committee of Estates to enforce subscription to the Covenant, all throw strong light on the condition of Scotland in those stormy times. There is also an extensive correspondence of the first Duke of Montrose, who was greatly instrumental in accomplishing the Union between Scotland and England. In addition to the Montrose Papers proper, the present duke possesses the Lennox and the Menteith collections, which are scarcely of less historical importance. The Duke of Sutherland's collection at Dunrobin Castle includes a series of title deeds, and, among important miscellaneous documents, some relating to the cathedral establishment of Bishop Gilbert de Moravia, at Dornach, in the beginning of the thirteenth century, and others illustrative of the working of the law of sanctuary. One of the papers clears up an historical difficulty. It proves to be the long lost dispensation for the marriage of Earl Bothwell to his first wife, Lady Jean Gordon, in 1565. There is a mass of important correspondence with the leading public men of the seventeenth and early part of the eighteenth centuries. Among the MSS. are the account books of Sir Robert Gordon, who managed the earldom from 1616 to 1622. These illustrate the condition of agriculture, and the sports and dress of the period. There is also the original Kalendar, of Fearn Abbey, in Ross, containing obits and historical memoranda, ranging from 1322 to 1650. The collection of the Earl of Dalhousie at Brechin Castle contains (besides the MSS. formerly reported on) the registers of most of the Scotch bishoprics and religious houses, and selections from many of the more important charter-rooms of Scotland. It has a copy of Wintown's chronicle.

For purposes of local history and genealogy, the papers of the Marquis of Huntly at Aboyne Castle, beginning in the thirteenth century, and the numerous documents of the Earl of Airlie at Cortachy are especially valuable. Among the latter is one which marks the importance of the bell of St. Medon (a relic of Celtic times), down to the year 1447, a charter by William the Lion to Cupar Abbey, a document by the vicar of Lintrathrim (May 27, 1560), stating that the English Prayer-book is used in his church, and many other noteworthy papers. The first portion of the charters of the Earl of Cawdor at Cawdor Castle throws light on the early thanes and thanages of Scotland, and the whole illustrates the condition of that country at various periods from the fourteenth century downwards. Some documents connected with lands in Argyllshire, which had belonged to the monks of Iona, are especially interesting. Among the documents in the Dunecht collection, belonging to the Earl of Crawford, is a manuscript detailing the proceedings under a commission issued by James I., in 1605, for the settlement of the borders. It contains lists of all the Grahams, and affords abundant details of the state of society then prevalent in the debateable land.

The Earl of Morton's collection of miscellaneous documents dates from 1474 to 1656. Some of these relate to important public events, others illustrate the social and domestic arrangements of the time. The Earl of Rosslyn possesses among other

valuable MSS. a large number of letters of modern date, comprising a series from Lord Clive, Edmund Burke, Lord Carlisle, the Duke of Portland, Fox, Pitt, and Lord Thurlow. The later portion of the letters, addressed to the second Earl of Rosslyn, dates from 1806 to 1830, including despatches and many private letters from Lord Brougham, unreserved political letters from Earl Grey and the Duke of Wellington. Another series, dated 1799, are from Lords Nelson, St. Vincent, and Keith. The most interesting portion of Lord Stair's collection is the "Stair Papers," the despatches, instructions, and correspondence of the second Earl, the general and diplomatist. They comprise a correspondence between the Earl as "Captain John Brown" and the Earl of Mar as "John Murray," between the years 1716 and 1720; his letters, partly in cipher, while ambassador at Paris, and many other documents which throw light on foreign and domestic politics during the last century.

The family records of the Earl of Strathmore, beginning with the year 1372, are especially notable for household and personal inventories and the detailed account of the rebuilding of Castle Glamis in the seventeenth century; those of Lord Forbes for ancient documents illustrating local history and topography with many papers of legal and historical interest; of Lord Torpichen for a series of papers belonging to the thirteenth, fifteenth, and sixteenth centuries, and connected with the history of the Knights Templars in Scotland; while the collections of Sir J. H. Burnett, Mr. John Guthrie, Mr. Irvine, and Mr. Leith exhibit documents affording insight into the agricultural and social arrangements of the district, others illustrating popular superstitions, and many bearing upon county history, and the condition of society in the seventeenth century. The records of the burgh of Montrose are of early date, and throw light on the early position of a Scottish municipal town.

The University of Aberdeen possesses a large set of documents relating to its foundation and history. A copy of "The Mirrour of our Lady" for half of the year is among its MSS. The library of Marischal College has, with other interesting MSS., the original papers and correspondence of Maclaurin. The records of St. Andrews commence almost with the foundation of the University in 1411, and contain materials for its history both before and after the Reformation; its schemes of study, its modes of collegiate life, and its eminent members. Among its valuable manuscripts is a copy of Wyntown's "Cronikil" and a notable Formulare of the sixteenth century. Besides a large correspondence bearing on the Scottish Episcopalian Church, Trinity College, Glenalmond, possesses documents relating to the Eastern Church and the proposals for an alliance between it and the Nonjurors, which was mooted early in the eighteenth century. The MSS. of Blair's College chiefly relate to the early ecclesiastical history of Scotland; among the more important of these are documents connected with the history of the Scottish Benedictines in Germany.

We understand that in Ireland also the labours of the Commission have during the past year been attended with very satisfactory results. Among the archives of the Earl of Granard the documents of the house of Forbes are important as illustrating the public affairs of Ireland; they also contain information respecting the embassy of Admiral Forbes to Russia in 1733-4, and other matters of interest. Lord Granard has too a manuscript whose authorship Mr. Gilbert assigns to Sir Alexander Stewart, first Viscount Mountjoy, in 1689, which consists of a hitherto unnoticed personal narrative of affairs in England and Ireland from the Restoration to the accession of James II., and supplies fresh details. Several fragile papers connected with Irish affairs from 1641 to 1690, and of high interest, are in the collection of the Earl of Rosse. The "Plunket Manuscript," belonging to the Right Hon. F. Plunkett Dunne, is all that is now accessible of a large work compiled in the seventeenth century, and mentioned approvingly by Carte, on Irish affairs from 1641. It is hoped that the now missing portions of this work which, revised by Dryden, was offered for publication in 1741, may be discovered. The O'Connor Don's MSS. include two volumes in Erse, not hitherto described in print, with some original papers which are the only specimens of their classes yet brought to light in connection with Irish Roman Catholics from 1641 to 1690. Dr. Lyons submits Archbishop King's correspondence and papers comprising unpublished documents relating to England and Ireland from 1681 to 1728, and letters from Addison, Berkeley, and other celebrities. The "Register of the Antiquities and Statutes" of Kilkenny compiled in 1609, by Robert Rothe, its first recorder, is of high value as supplying copious extracts from long-missing documents. It has hitherto been unknown to historic investigators. The unarranged and uncatalogued collection of the Marquis of Ormonde at Kilkenny Castle includes much of high interest in England, while, as regards Irish history, Mr. Gilbert considers its value as beyond appreciation. Its original documents commence with the time of Henry II., extending to the early part of the eighteenth century. Besides parchments, there are letters, papers, and books in great numbers, including a large mass of correspondence in connection with the public life of the second Duke of Ormonde, *temp.* Anne, which affords valuable new matter for history. Two manuscripts in the collection of Mrs. Willes, Goodrest, Berks, afford great insight into the state of Ireland about the middle of the last century. They consist of letters and memoranda on the subject written by the Right Hon. Edward Willes, who was Chief Baron of the Exchequer in Ireland. The letters are addressed to Lord Warwick, and detail the writer's observations during his several circuits as Judge of Assize, between the years 1757 and 1768; the autograph memoranda were made by the Chief Baron in Dublin and elsewhere during his residence in Ireland. The interest of both volumes is almost entirely social and economical; they supply information not be be found elsewhere, on the character of the people, the tenure of land, the agriculture, the industrial and economical relations, of the country; in short, its entire social condition during the last century.

G. Waring.

Intelligence.

In the *Revue des Deux Mondes* for February 15, M. Rénan gives an interesting account of Pierre du Bois, and the writings which, with different degrees of certainty, have been ascribed to him. He was a zealous supporter of the royal supremacy, was probably concerned in the forgery of the Bull *Scire te volumus*, and certainly took an active though obscure part in the measures for the destruction of the Templars. He was a firm believer in astrology, and appears to have been satisfied that Charlemagne reigned not less than 125 years, but his remarks and counsels on the internal administration of France are remarkably acute and provident. His views on foreign policy were vast and more chimerical, embracing a scheme of universal dominion for the King of France, to be attained with the co-operation of the Pope, under cover of a grand Crusade. The Holy Land was to be extensively colonised, and the rest of the East converted by the instrumentality of a college like that of the Propaganda, only with students of both sexes.

The *Revue archéologique*, we are sorry to hear, will shortly cease to be published.

Miss Cusack's history of the county of Kerry is on the eve of publication. The work will embrace all the materials contained in Smith's history of the county (which was published in 1756, and is now extremely rare), as well as much additional matter derived from documents in the possession of local families. We are not able to indicate the actual value of this additional matter; but we apprehend that it has little connection with the affairs of "the kingdom of Kerry" previous to the year 1700, a period after which its history assumes a most commonplace character. Miss Cusack has not acted wisely in undertaking a work of this kind, without being able to avail herself of the information contained in the *native* sources.

Apropos of Dr. Gustav Oppert's theory about Prester John, expounded by Prof. Liebrecht in the *Academy* for Feb. 1, some remarks by Mr. H. H. Howorth, in No. 6 of the *Phœnix*, may be found interesting. Mr. Howorth adheres to the old view that Prester John was a Khan of the Keraites, not the Gourkhan of Kara Khitai, as Dr. G. Oppert supposes. He gives the three following reasons:—1. The Persians and Arabs identify the Keraites with the people of Prester John, and can hardly have confounded the former with an empire so well known to them as Kara Khitai. The same is true of the Franciscan missionaries. 2. The grandfather of Oang Khan (d. 1198), the Khan of the Keraites, was called Marcouz Bouyouronc; Marcouz is clearly a Christian name. 3. The Keraites are, as Mr. Howorth adduces strong evidence to prove, identical with the Kalmucks. And whereas the Turkish tribes, among whom the people of Kara Khitai are to be reckoned, have exhibited a strong tendency to Islamism, the Mongol races show an equally strong inclination to Lamaism.

We learn from the new Spanish *Revista de Archivos* that a volume of indices of the national archives will shortly be published in Spain, containing an account of the documents which belonged to the Benedictine monastery at Sahaquin. The collection consists of diplomatic correspondence dating from the ninth century.

The first issue of the collection of original documents in the Madrid archives has appeared; and contains the interesting *Fuero* made for Magerit (Madrid) in 1240.

M. Hertz has followed up his review of Peter's *Historicorum Romanorum reliquiae*, contained in the *Academy* for February 15, by an examination of certain points of detail, reprinted from the *Index Scholarum* of the University of Breslau. The fragments have come down to us in such a second-hand form, through Nonius and other grammarians who had not the original works before them, and did but carelessly copy from previous compilations, that the task of arrangement is by no means easy. M. Hertz has succeeded in restoring to the Clodius Licinus mentioned by Livy 29, c. 22, as having written a book called *Res Romanae*, several fragments hitherto assigned to Licinius Macer, or Claudius Quadrigarius. Claudius Licinus was Consul A.D. 4, and therefore Livy's contemporary. He also shows that Q. Elogius, the supposed author of a book on the Vitellian family, has been created out of a misreading of the sentence "extatq. elogii libellus." A fragment quoted from Sisenna reads thus: "Sisenna historiarum libro IIII: accolis celeriter consumptus ad gladios certationem revocaverunt." Lipsius corrected "iaculis" for "accolis," Hertz remarks that the first letter of iaculis had slipped back to the number of the book, and therefore the fragment belongs to Sisenna's third book, and not to the fourth. Some of the fragments retain the picturesque charm which revived the popularity of the old authors in Hadrian's time; *e. g.*: "equae hinnibundae inter se spargentes terram calcibus," "arma plerique abiciunt atque inermi inlatebrant sese," "conprehensare suos quisque, saviare, amplexare." Peter's second volume will contain the fragments of the historians who wrote under the Empire—a work, strange to say, not yet attempted.

Señor Gonzalez has commenced a very interesting series of papers, in the *Revista de España*, on the Moriscos who remained in Spain, and merged in the general population, after the decree of expulsion by the Government of Philip III. He protests against the imputation of special intolerance with which the Spaniards are charged by those who forget the deeds of Henry VIII. and Mary in England, of Charles IX. and Louis XIV. in France; and he shows, in his first number, that, when Christianity first gained definite preponderance in the Peninsula, a system of toleration was established. This spirit appears in the stipulations at the surrender of Toledo and other towns of Castile, when the Moors were allowed the right of being judged by their own tribunals. Mendoza, the Sallust of Spanish literature, does not hesitate to do full justice to the Moriscos, and to commiserate their fate; while many chivalrous tales, creditable alike to Christians and Moors, had their effect on the public mind. These considerations must be placed against the bigoted policy of the Spanish government in later times; and the kindly feeling of the people seems to have caused the permanent settlement, in Spain and Portugal, of many families of converted Moors.

Señor Sanchez de Molina Blanco has undertaken the useful but very laborious task of compiling a digest of the whole body of Spanish civil law from the *Fuero Juzgo* of the Goths to the latest enactment, together with the sentences of the Supreme Court of Justice. The first number of this work has just been published in Madrid.

Mr. Cartwright's sketch of Bergenroth has recently been supplemented by the interesting obituary published last year in his native province, which is based chiefly on correspondence with his mother and sister. Time and separation never weakened his home ties, nor his feelings of warm affection for his family. In one of his last letters he expressed his regret that his work was in a language which prevented his mother from reading it, and declared his intention of translating it for the use of the dear ones at home. Besides the beginning of his *Charles V.* he had completed a collection of several volumes of valuable historical materials.

The *Gazzetta Uffiziale* of Florence of Feb. 16 and 17 notices the endeavours now being made to discover the burial-place at Milan of an unfortunate member of the House of Braganza, D. Duarte (Edoardo), who died there 1649, after seven years of imprisonment. The *G. U.* of Feb. 27 describes the discovery in the Lake of Agnano of a Roman fountain. This lake is not mentioned in ancient writers, and probably has only existed since the Monte Nuovo was raised by the volcanic forces at work in 1538.

The University of Cracow is publishing its original documents (*Codex Diplomaticus*) from the year of its foundation, 1364, to the present day, in five volumes. The first reaches to 1440: the struggle between the German and Polish elements in this university is noteworthy, as also the part played by the Jews. Our own universities might follow the example of Cracow with advantage, and a good beginning was made by Anstey's *Munimenta Academica.*

Contents of the Journals.

Göttingische gelehrte Anzeigen, March 1.—G. Kauffman reviews Dahn's book on the history of the Visigoths, and points out that the theory of their having acted on a nominal theory of subjection to Rome has no real foundation in contemporary authorities. March 8.—Zacharia discusses the constitutional question as to the right of voting the Budget yearly by the Prussian Chambers. March 15.—F. Matz reviews the first volume of Brunn's great Collection of the Reliefs on Etruscan Vases. These come mostly from North Etruria, the South kept long to burial in sarcophagi. The material available at each place makes a great difference in the representations. The alabaster of Volterra admits of very fine work, while the wretched travertine of Perugia is as bad material as can be. Each place seems to have its favourite subjects; the offering of Iphigenia occurs rarely except at Perugia, Ulysses and the Sirens only at Volterra. The value of the book is great, both as illustrating the sources of Greek mythology which were known in the West (especially the Greek heroic poems), and as throwing light on Etruscan art and Etruscan character, which seem always to prefer bloody and painful scenes, as became a nation from which Rome borrowed her gladiatorial shows.—Frensdorff analyses the progress made in publishing the original documents of Silesia. G. Korn, the editor of the Breslau documents, was one of those who fell in the great battles before Metz.

Augsb. Allgemeine Zeitung, Beilage, March 10, notices the inscription by the gate of Siena which commemorates the meeting of the Emperor Frederic III. with his bride, Eleonore of Portugal, in 1452, under the auspices of Pius II. (Æneas Sylvius); an event also commemorated in the paintings on the wall of the "Libreria" in the Cathedral. Monuments relating to the emperors are rare in Central Italy.

The **Gazzetta Uffiziale**, March 1, contains a detailed account of the tombs discovered at the Salarian Gate, and described by Mr. Hemans in our last number.—March 6 analyzes Gozzadini's researches as to the mansions (or rather towers) of the old families of Bologna, some of them famous names, *e.g.* the Lambertazzi, mentioned by Dante.—March 13 notices the opening of the outer Loggia of the Palazzo Ducale, which has been adorned with medallions of 119 Doges. One of them, that of Marino Faliero, is copied from a miniature in the Chronicle of Raffaello Caresini, now in the Library of St. Mark.

Bullettino Archeol. 1871.—De Rossi, in an article on "Archeology in the 14th century," shows that the "Descriptio urbis Romae ejusque excellentiae" is probably a work of the famous tribune Cola di Rienzo.—Finzi gives a summary of Palma's discoveries and excavations in Cyprus, especially at Golgos and Soli; the excavations at Golgos have brought to light the temple of Venus.

Literarisches Centralblatt, March 18, contains a notice of the important publication by the Academy at Vienna of the "Acta et Diplomata monasteriorum et ecclesiarum Orientis," vol. I. This volume contains two collections from Asia Minor and one from Thessaly. Besides the facts of church history, some new information is given about the Greek emperors at Nicaea, and the two first of the Palaeologi. Slavonian history as well as Byzantine will receive illustration from the future volumes.—A. Hantke's book on the Chronicle of Gislebert of Mons is praised. Gislebert gives us a history of Baldwin V., Count of Flanders, a man of some importance in both English and French history.

Philology.

THE PRONUNCIATION OF LATIN.

III.

Professor Munro (in his privately printed *Remarks on the Pronunciation of Latin*, p. 8), Mr. Roby, and the editor of the *Public School Latin Grammar* (p. 486), all advocate a *w* pronunciation of Latin *v*. As of all the changes which a new system of pronunciation would introduce this would undoubtedly be the most startling, and, to my mind, the most repulsive (fancy, for instance, *Aen.* iv. 459-461 pronounced

> Welleribus niweis et festa fronde rewinctum.
> Hinc exaudiri woces et werba wocantis
> Wisa wiri),

I venture to offer a few considerations on the other side.

1. Priscian, i. 46 (quoted by Corssen, i. p. 310), says that anciently *f* had the same sound which *u* consonans had afterwards, whence *af* was written for *ab;* but as vau or the digamma could not stand at the end of a syllable, it was changed to *b*. This is perfectly intelligible if *u* consonans was like *v*, unintelligible if it was like *w*.

2. In another passage, where he speaks at length on the pronunciation of consonantic *i* and *u*, Priscian says (i. 22) contrasting the Æolic digamma with the Roman *v*, that the former constantly represented an aspirate, and was used to avoid a harsh aspiration, whereas this was only true of a few Roman words, e. g. *uespera, uis, uestis*. If these were pronounced *wespera, wis, westis*, would they represent an aspirate at all? whereas the transition from *h* to *v* (and I believe this is the meaning of Priscian in all three cases) is the natural change from a hard to a softer breathing.

3. Priscian goes on to say that the digamma was used in some Greek words as a means of avoiding hiatus, e. g. in δαϝιον Δημοφαϝων Λαϝοκοϝων; and that the Romans interposed similarly a *v* in *Dauus, Argiuus, pauo, ouis, ouum, bouis*. If the interposed *v* was in sound a *w*, it would not have been the effectual barrier against hiatus which it proved, nor could Priscian have proceeded to mention as parallel instances of interposed consonants the *b d* and *c* of *prodest, comburo, sicubi*. And that Priscian gave to the digamma in the Greek words mentioned a sound more like *v* than *w* would seem to follow from the varieties of spelling in the MSS. δαφιον, δημοφαφων, λαφοκαφων.

4. Priscian (i. 38), after stating that *u* was anciently represented by *o* in many words, particularly when preceded by the digamma, as in *seruus, uulgus*, originally spelt *seruos, uolgus*, proceeds to remark, *est quando amittit uim tam uocalis quam consonantis ut cum inter q et aliam uocalem ponitur, ut quis quoniam*. The same sound, neither of a vowel nor of a consonant, but something between, he heard in *sanguis, lingua, suadeo, suauis, suesco, suetus*, and in the Æolic forms τῦδ' and πῆλυι. *This* sound must have been very like a *w;* and it follows that the strict *u consonans* was different, and if so, it must have approximated to the more clearly defined, more properly consonantic sound of our *v*. The same seems to follow from what Priscian (Partit. xii. 24, 5) says of the sound of initial *vĭ* and *fĭ*, followed by *d, t, m, z, x*. In such words, e. g. *uideo, uitium, uim, uir, uix, fides*, in all of which the *i* was naturally short, it had a sound like Greek υ, as opposed to its ordinary coarser sound in *uidi, uita, uires*, &c. The difference is easily intelligible if we give *v* the sound of English *v*, and the analogy of the two cases (*vi, fi*) is at once perceptible; pronounce *video* as *wideo* and the pinguitude of the first letter will be found, if I mistake not, to prevent, or at any rate to stand in the way of refining the second.

5. The change from the original *fu* of the perfect and pluperfect to *v* in *audiui audiueram* is simple and natural if *v* represented a sound like our *v*, i.e. a sound containing elements both of *b* (*bhu*, &c.) and *f*. This could not be said if *v* was a *w*.

6. The argument in favour of a *w* sound drawn from Greek writing of Latin words is inconclusive. Corssen shows that οὐ, β, οὐβ, as well as ο and υ after *q*, are all used as expressions of Roman *v:* and Blass (*Ueber die Aussprache des Griechischen*, p. 31), comparing the forms Ἀυεντῖνος, Ἀουεντῖνος, Ἀβεντῖνος, infers, and, I think, justly, that none of the forms was an exact representation of the Latin sound. If side by side we find Οὐάῤῥων Βάρρων, Οὐεργίλιος Βεργίλιος, Οὐαλέριος Βαλερίανος, it is impossible to acquiesce in a *w* sound of these words as the final and only one. *W* is a gross, I would almost say, a barbarous sound; *b* is a refined and delicate sound. The conclusion is, it would seem, rightly drawn by Corssen; Latin *v* was midway between Greek οὐ and β, like the Greek digamma with which it is constantly compared (cf. Quint. xii. 10, 29, i. 4, 7), and which also could scarcely have passed into β in βρόδον βρέχω, if it had not been more like a *v* than a *w*. We may put the argument in another shape: suppose a Greek to have heard the Roman name Vennonius pronounced with the English pronunciation of *v*, the German of *w* in *wie;* how *could* he have transliterated it in his own alphabet? He had lost the digamma; φ would not express it; the only single letter he could use was β; but β is after all quite different. He was reduced to a mere copy of the Roman letter *u*, i.e. οὐ, not as expressing the sound exactly, but as suggesting the Roman spelling, and thus recalling their pronunciation, at the same time that it, in some degree, represented the sound. And this may be the meaning of the passage of Nigidius Figulus quoted in A. Gellius, xix. 6, and referred to by Professor Munro. Speaking of vowels, Nigidius says: *A et o semper principes sunt, i et u semper subditae, e et subit et praeit; praeit in Euripo, subit in Aemilio. Si quis putat praeire u in his, 'iampridem,' 'iecur,' 'iocum,' 'iucundum' errabit quod hae literae cum praeeunt ne vocales quidem sunt.* That is, *u*, like *i*, is never the first of two coalescing vowels, always the second, *Euripus eidem;* in words where *u* or *i* seems to be the first of two coalescing vowels, this is a mere mistake occasioned by the spelling; in words like *Volusius iocum*, the *u* and *i* not only do not coalesce as vowels with the following *o*, they are not even vowels at all. He is speaking, I think, not of an actual nearness to a vowel sound which attached to *i* and *u* in these cases; but simply to the possibility of mistaking each of them for the first vowel of a diphthong, owing to their being written without anything to distinguish their real consonantic nature. Still less support can be drawn in favour of *w* from the other passage of Nigidius Figulus (A. Gell. x. 4). Arguing that words are the

outgrowth of nature, he says, "when we say *uos* [we place the mouth in a position which agrees with the meaning of the word itself, we move the front of the lips gradually outwards and direct the breath and air straight before us towards those with whom we are speaking." Surely it will not be denied that this is a description of an outward, not of an inward, sound; of a projected *v*, not a half-withdrawn *w*. And so the description of the letter given in Hagen's *Anecdota Helvetica*, p. 307, *V ore constricto labiisque prominulis exhibetur.*

7. The last point I shall touch upon is the interchange of *b* and *v* in Latin words. Corssen traces *b* for *v* in inscriptions from the end of the first century A.D. onwards; *v* for *b* from the second century. But if MSS. may be taken as any guide to determine the spelling of authors,—and I believe that this is more true than not of the earliest and best,—the two letters must have sounded very like each other in a large number of words from the time of Cicero and Varro onwards. In the first book of the *de Republica* alone, imperfect and fragmentary as the palimpsest is, will be found, sometimes unaltered, sometimes with the more ordinary spelling superscribed, *lavoribus lavoris provabiles dauant bita salutabit* (for *salutauit*) *nouilior uello adprouauissent inuecillis uelli liuidinis liuidinibus gustabit* for *gustauit liuidini pribatum.* Varro's *Bimarcus* is more usually spelt *Vimarcus* in the MSS. of Nonius, including the excellent Harleian; *uoluae* appears as *boluae* (Non. 201) in the Eumenides of the same author; and both Lucilius and Varro used alternately *bulga* and *uulga* (Non. 78, 187). Again, Varro derives *ueruex* from *uerto* (L. L. v. 99); the same word is quoted from Varro in the accusative *uerbecem* (Non. 189), and is identical with the *berbix* of Paulus Diaconus (pp. 4, 46, Müller). So again *urbs* is derived by Varro *ab orbe et uruo* (L. L. v. 143), an etymology countenanced by Festus (p. 375, M.), by Pomponius in the Digest, 239, § 6, and by Placidus (p. 491, vol. iii. of Mai's *Classici Auctores*), whose glossary is believed by Ritschl to have been composed with special reference to Plautus. There is the same doubt as to *bicessis* or *uicessis* (Varro, L. L. v. 170), *uibices* or *uiuices* (L. L. vii. 63). And if Laberius said *ad amorem iniciendum delenimenta esse deliramenta, beneficia autem ueneficia* (Fronto, i. 7), can we doubt that the *b v* approximated much as the *d* of the one word to the *d* of the other? That the sounds were notwithstanding distinct is clear from Priscian's words, ix. 43, *feruesco. dicitur tamen etiam per b ferbeo ex quo ferbui.* This seems to give the right point of view; *v* was sufficiently near in sound to *b* to be spoken and written for it in many words; sufficiently different to allow a grammarian to call *feruere, ferbere, feruescere, ferbescere,* different forms. If this was so, *v* was not a *w*, but a *v* or something like it; and this change from *ueruex* to *berbex* whence Italian *berbice*, French *brebis*, from *uesica* to Port. *bexiga*, from *neruus* to *nerbo*, &c., is the counterpart of what takes place in children's pronunciation of *have dove give* as *hab dub gib.*

R. Ellis.

TO THE EDITOR OF *THE ACADEMY.*

Sir,—There are two principles on which the pronunciation of a foreign language, living or dead, may be regulated:—

(1) We may endeavour to approximate as closely as possible to the actual sounds used. This may be called imitative pronunciation.

(2) We may aim at representing the written language by the use of so many of the sounds of our own language as may be necessary. This may be called representative pronunciation, or pronunciation addressed to the eye.

In the case of a living language—that is to say, a language which is the mother-tongue of some people now living—the former method, when attainable, is always preferred. In the case of dead languages the second method has been followed by scholars of all nations, perhaps without exception. Even in the highly exceptional case of Sanscrit, where the right manner of reciting has been handed down as a sacred duty for thousands of years, it does not appear that European students try to imitate all the distinctions observed in Indian pronunciation; *e.g.* between d and *d*, ç and s.

I venture to think that universal experience has in this matter followed the best course, namely, that every nation should construct a conventional system out of its native sounds capable of representing the written words to the eye and the understanding.

The chief reason for this course I take to be that the effort of acquiring an imitative pronunciation is not repaid by the result. It takes a great deal of time and trouble to learn the sounds of a foreign language, even in the imperfect degree which is usually attained. In the case of spoken languages there is a good reason for giving this time and trouble. Our motive in learning the real sounds of French and German words, rather than pronouncing them in our own way, is that we wish to be understood by Frenchmen and Germans. But when we read or speak Latin, the more English our accent is the more certain we are of recalling to our hearers the precise words which we intend. And this, after all, is the main, if not the only, object in pronunciation.

Secondly, it is not of much use to learn the "right" sounds of a language when after all we cannot tell how nearly we have succeeded. Although the main outlines of the pronunciation may be theoretically certain, there are endless shades of difference, constituting what we call the accent of a language, without which an imitative pronunciation is hopeless. Let us suppose that we possessed the most accurate instructions for pronouncing French, and followed them most carefully, but had never heard the sounds from a living Frenchman, would our imitation of these sounds be worth the trouble of making? The case is the same in Latin, with the additional circumstance that we are certain never to have to put our success to the test. We cannot hope to imitate the Latin of an ancient Roman; and if we could do so, we should still be unable to find an ancient Roman to recognise and profit by the accomplishment.

There appears to be a general feeling against the usually too favourite proposal of a "compromise," and on the side of making a reform, if adopted at all, as complete as possible. If so, it is clear that we ought also to reform our pronunciation of Greek. What more confessedly one-sided "half-measure" can be imagined than that which consists in reforming one of the two classical languages without the other? If our present plan will do for Greek—and I hear not a word of dissatisfaction with it—surely there is no pressing need of change in respect of Latin.

There is a reform, however, depending on the second of the two principles stated above, and applicable to Greek as well as to Latin, which I should not be sorry to see adopted. It is substantially that which the Oxford Committee proposed for Latin, and consists in pronouncing the Latin vowels *a, e, i, o, u*, and the Greek α, η (ε), ι, ω (ο), ου (perhaps υ), like the English vowels in *father, where, fill, whole, full*, respectively. This plan would give no vowel a sound which it does not have in some English word, except perhaps *ī* (long), which would be sounded like *ee* in *feel* rather than *i* in *fill*. The difference from the present practice would be that the same vowel would always be pronounced with the same tone or quality, instead of varying in quality along with variations of quantity. This uniformity is not merely right as an approximation to the "right" sounds, and to the sounds used in most cases by other countries, but it is desirable in order to make our pronunciation represent the written language. We should thus extend the principle applied by Winchester men to *a*, by Irishmen to *a* and *e*, and by Scotchmen and English Roman Catholics to all the vowels. Incidental advantages of such a method would be, that the music of the language, which depends mainly on the vowels, would be restored, and that a considerable approach would be made to European agreement. It would also greatly facilitate the attempt, should that be made, to distinguish quantity in pronunciation: a reform which might be left optional, the more so that any one could adopt it, and abandon it again as he pleased, without inconvenience to his neighbours.

Some of the arguments now used, such as the desirableness of representing the same letter by the same sound, undoubtedly apply to the pronunciation of *c* and *g*. I will only say that, placing on one side the inconvenience, which I feel, of having only one pronunciation for words whose spelling is different, *e.g.* for *scena, cena, Sena*, and on the other the inconvenience of having to learn and to teach an entirely new way of pronouncing the combinations *ce, ci, sce, sci*, &c., I prefer the former inconvenience to the latter. As to the comparative "rightness" of the two methods, few who have read Mr. Munro's argument can

entertain any doubt. He has supplied all the defects which Mr. Max Müller so well pointed out in Corssen's proof. But it does not follow that the speculative rightness of this or that pronunciation is decisive on the question of adopting it in practice.

Although no reform in this matter should come to be adopted—and I confess that I look upon the advantages to be gained by any reform as very trifling—the discussion will not have been fruitless if it excites an interest in the historical study of Latin. Mr. Munro's article, and, I may venture to add, the privately circulated paper of which it formed a part, have already made a considerable advance upon the state in which Corssen's book left the subject. Yet this brings us no nearer a decision of the immediate question. While his discoveries extend and complete our knowledge of the Latin sounds, the difficulty of expressing this knowledge in our ordinary pronunciation is made proportionately great. The present is not a time to add to the labour of learning Latin and Greek. It would be as impolitic as unreasonable to burden the memory of every beginner with the results of a new and refined enquiry; and it would be no less a pity to clog the enquiry with merely practical and pædagogic considerations.

D. B. Monro.

P.S.—Let me add a remark on the speculative question. An article in the last number of *Kuhn's Zeitschrift*, "Messapisches," by Dr. Moritz Schmidt, gives instances of Greek σ and ζ for Latin *c*: especially in the name of the great family of *Dasii*, in Latin *Decii*. This instance, like those quoted by Mr. Max Müller from Umbrian, and by your correspondent Mr. D. Bikelas from modern Greek dialects, only shows that changes like the softening of the *c* usually take place unequally over the area within which a language or group of dialects is spoken.

THE EARLY ENGLISH TEXT SOCIETY.

The Early English Text Society was founded by a few members of the Philological Society, who, wishing to continue the publication of Early English texts, which the society had begun, but been obliged to discontinue from want of funds, formed a committee for the purpose of collecting subscriptions and printing MSS. The chief cause that seemed to make the formation of a new society desirable was the unsatisfactory way in which the already existing societies brought out their works, limiting their issues to 100 copies, and impeding their circulation in every way. The result was that after the Philological Society had ceased to publish Early English texts, several of the members had to send their texts to German periodicals, there being no society in England which would print them. The committee resolved therefore from the beginning to keep free of all dilettanteism and exclusiveness, and limit themselves to the production of plain working editions that should be accessible to all. The society started in 1864 with 22 subscribers, whose number at the end of the year had risen to 145, and gradually increased, till, at the end of 1868 it had 660 members, without counting those who subscribed to the extra series, intended for re-editions.

These statistics show good progress, but it is to be hoped that when the study of Early English has taken firm root, the society will number its members not by hundreds but by thousands.

With this poor support the society has done more to illustrate the life, literature, and language of our forefathers than any other printing club or society in the United Kingdom. If it had produced nothing else but *Piers Ploughman*, *English Guilds*, *Ayenbite of Inwit*, and the *Early English Homilies*, the society would have deserved well of English literature. The publication of Bishop Percy's MS.—the foundation of his celebrated *Reliques*—was also undertaken by three members of the society. The Chaucer Society, which has for the first time laid a sure foundation for the critical study of Chaucer's works, was founded by members of the E. E. T. S.: nothing but want of funds prevented Chaucer's works from being included in the publications of the original society.

The quality of the society's work is, generally speaking, good; much of it is far above the usual average of editorial work. Some of the texts show signs of carelessness and incapacity, yet even the worst of these will bear comparison with the average work of some societies we could mention, and in most cases the committee have either given careful corrections of these faulty texts or promised to have them re-edited.

It is a question whether the society has not sometimes gone too far in its attempts to popularise its editions. We allude particularly to the translations which accompany the older works. It is evident that all the texts do not possess an equal or the same kind of interest. Why, then, should a work like the *Ayenbite*—a literal translation from the French—be edited on the same principles as *Hali Meidenhad* or the *Homilies*? The latter are of high social and antiquarian interest, and therefore there is some reason for making them accessible to those who take no interest in the language, but in the case of the *Ayenbite*, whose value is wholly philological and dialectic, such an aid as a translation is superfluous, if not positively injurious, leading as it does to shallowness and inaccuracy, and a neglect of grammar and dictionary work, which is as essential to a sound knowledge of Early English as of any other language. In those special cases where a translation is really required, it should be stowed away at the end of the book, so as not continually to stare the reader in the face and suspend the exercise of his faculties. At any rate, different styles of editing should be adopted for different classes of texts, even if it is not advisable in all cases to replace translations by explanatory notes and glossaries.

Henry Sweet.

TO THE EDITOR OF *THE ACADEMY.*

Sir,—You are no doubt aware that the study of Sanskrit lexicography has hitherto yielded as few chronological facts as that of any other branch of Hindu literature, and that of the more prominent authors of Koshas the dates of two only, viz. *Maheśvara* and *Hemachandra*, seemed to have been pretty satisfactorily settled. *Hemachandra*, the reputed author of a dictionary consisting of a synonymous part, the *Abhidhânachintâmaṇi*, and a homonymous one, the *Anekârthasangraha*, and of several other works, appears to have lived before A.D. 1292, since a commentary on one of his works is dated in that year. On the other hand, as his homonymous glossary is, to a great extent, identical with that of *Maheśvara*, the *Viśvaprakâśa*, which claims to have been compiled in Śaka 1033, or A.D. 1111, Wilson, for reasons of some plausibility, inferred that Hemachandra was posterior to Maheśvara, especially as there was other evidence showing him to have lived about the middle of the twelfth century; although according to Wilson a Gujarat king was converted by him to the Jaina faith in A.D. 1174, whilst Dr. Bhâu Dâjî, in a recent number of the *Journal of the Bombay Asiatic Society*, makes him die in A.D. 1172.

As regards *Maheśvara's* work, the *Viśvaprakâśa*, this Kosha consists, in the first place, of two chapters, one treating of homonymous nouns, the other of indeclinables. At the end of the second chapter the MSS. hitherto known contain several Ślokas, the last of which states the work to have been compiled in Śaka 1033. After this there follow in the MSS. two more chapters, one on words spelt in different ways, the other on gender. Prof. Aufrecht, in describing the Oxford MS. (Catal. p. 188), expresses some doubt as to the genuineness of these two chapters, chiefly on account of their being preceded by the date, which one may naturally expect to find at the end rather than in the middle of the work. Of the India Office MSS. of the same work, three were known and compared by him (Nos. 246, 322, 1539), none of which would appear to be more than a hundred years old, whilst the Oxford MS. was not copied before 1820. In examining some MSS. I have lately found another copy of the same work (I. O. 1937), written in Western India in Samvat 1728, or A.D. 1671. This MS. would seem to corroborate Prof. Aufrecht's conjecture, since it does not contain the two last chapters, there being nothing to lead one to suppose that it is not the whole of *Maheśvara's* Kosha. On the other hand, the colophon is preceded by three Ślokas only, while the one containing the date is *wanting*. It therefore remains to be seen whether MSS. of this work which may hereafter be discovered in India may or may not contain that precious Śloka. In MS. I. O. 1539, I may remark, it occurs in the beginning of the third chapter, whilst there are four other couplets at the end of the second chapter. I need hardly tell you that the authenticity of this date is a matter of some importance, not only for a true appreciation of the relation between *Maheśvara* and *Hemachandra*, which, it is to be hoped, may still be established by a close comparison of their Koshas, but because it has been made the starting-point for settling the relative dates of several other writers. Of the commentators on the *Amarakosha*, several give their own dates, as *Râyamukuṭa*, Śaka 1353, or A.D. 1431; though another commentator, *Nayanânanda*, who must be much posterior to the former, claims the same date for his compilation, the *Amarakosha-Kaumudî*; *Nârâyaṇa's Padârthakaumudî* was compiled in Śaka 1540, A.D. 1618.

In concluding these remarks I may mention, what few scholars are probably aware of, that a great part of Hemachandra's grammar, the *Śabdânuśâsana*, together with the *Laghuvṛitti*, exists in MS. in the I. O. Library: MS. 725, dated in Samvat 1495, or A.D. 1438, contains the first and fourth Adhyâyas, in four Pâdas each, the first and second Pâdas of the second, and the third and fourth Pâdas of the third Adhyâya. Hemachandra's arrangement is, generally speaking, pretty much the same as that of other modern Sanskrit grammars, whilst his terminology is that of the Sarasvatî, Kâtantra and others. Of his *Anubandhas*, however, only part are identical with those of *Pânini*, the rest being peculiar to his system. J. Eggeling.

THE MOABITE STONE.

We have already announced Prof. Hitzig's pamphlet on the Moabite Stone; it proves to be as unsatisfactory as it is original. In spite of M. Ganneau's assurance that the word in the original (lines 1, 2) is הדיבני, Prof. H. insists on הציבני, contrary to the general Biblical usage. In line 3, H. reads בכל ישע; he renders קרחה "Freiplatz," *i.e.* a place without trees, analogous to שמי. In line 19, he reads האשׁ[מ]ין, and renders "prisons for the convicts." In lines 27, 28, he translates, "I built Bezer, for the men of Dibon in arms hindered me, for Dibon was in rebellion." Here משמעת is taken as if from משמערת, analogous to ללת. In lines 28, 29, he renders, "And I dwelt at Bezer, in order to see the horn, which I have added to the land." The horn means Bezer; comp. "the horn of Moab," Jer. xlviii. 25. Prof. H. rejects the notion of taking Astar Chemosh, line 17, as the name of a god, and translates עשתר "treasure" by an impossible derivation. Prof. Schlottmann has a paper "On Astar-Kamos" in the *Zeitschr. d. d. m. G.* xxiv. 649–671. He defends his own explanation of Astar, "consociatio," and refutes Hitzig's. In the same periodical, Schlottmann gives a list of the numerous passages where H.'s conjectures conflict with Ganneau's latest corrections. An interpretation of the inscription by a Hungarian professor (Dr. Ballagi of Pesth) is described by Dr. Goldziher (p. 710); it was made at too early a stage to be of much use. We have already referred (pp. 104, 148) to Dr. Himpel's two able papers in Merx's *Archiv* and in the *Theolog. Quartalschrift*, and have only to complete our record by Prof. A. B. Davidson's judicious summary in the *British and Foreign Evangelical Review* for January, and M. Jules Oppert's translation given in the *Journal asiatique*, mai-juin 1870, just received. M. Oppert renders line 18 thus: "J'enlevai de là les [? veaux] de *Jéhu*," where all other critics now render Jehovah. The translation was read before the Société asiatique on April 8, 1870. No commentary is attached.

Intelligence.

The University of Cambridge has just been presented with 102 vols. of Oriental MSS., chiefly Arabic and Persian, by the representatives of the late Arabic Professor, the Rev. H. G. Williams.

The fourth part of W. Radloff's great work on the nomadic races of Central Asia is in the press; it is to contain the dialects of the Tobolsk country. An account of the work and its author by a competent hand is given in *Trübner's Record*, Feb. 28.

Dr. A. Wilmanns, hitherto librarian at Freiburg, has recently been nominated to the post of Extraordinary Professor in the same University. We trust that one result of his advancement will be the speedy publication of his long-promised edition of Varro *de Lingua latina*.

Among the latest publications of Messrs. Teubner is a critical edition of Cornelius Nepos by the learned editor of Cicero and Quintilian, C. Halm; it will be most welcome to all those who are aware of the numerous fluctuations of reading in an author so widely read as Cornelius Nepos. But no doubt the most important philological publication of the month is the *new* edition of F. Ritschl's *Trinummus*, forming the first instalment of his new edition of Plautus. It is now twenty-three years since the first edition of the *Trinummus* appeared, and much has been done and achieved since then in the study of Latin in general, and of Plautus and archaic Latin especially; but it should be remembered that most of those studies received their first impulse from the Prolegomena to the first edition of the *Trinummus*. The editor promises new prolegomena at the end of the first volume of his new edition. We shall soon bring an extensive article on this important publication.

A new edition of *Antiphon*, with an elaborate critical commentary by Dr. F. Blass, has just been published by the firm of Teubner; also a new edition of Cebes' *Tabula*, by F. Drosihn. The first number of the *Acta Societatis Philologae Lipsiensis* (with a preface by F. Ritschl) has also come out.

The two concluding numbers of F. L. K. Weigand's new edition of Schmitthenner's German Dictionary (the first volume of which appeared as far back as 1857), have at length been published. We think it right to direct the attention of our readers to this work, now complete in two large volumes, which may be justly said to be the most *scientific* and methodical work of its kind, and which, as long as Grimm's gigantic Dictionary is incomplete (and how many will live to see it finished?), is at once the most reliable and convenient dictionary of the German language. We presume that our readers know that Prof. Weigand is one of the gentlemen appointed by Jacob Grimm himself to continue his work, when death took the pen out of his hand.

We learn with great regret that the *Revue critique* is to be discontinued after the numbers already subscribed for have been published. It is to be hoped that it may again come to life in quieter times and in an enlarged shape.

The second number of the *Revue celtique*, only half of which is at present printed, will contain:—De la disparition de la langue gauloise en Galatie, par M. G. Perrot, un des directeurs de la *Revue archéologique*.—Fionn's Enchantment, a popular tale of the highlands of Scotland, Gaelic text with the English translation, by J. F. Campbell, Esq., author of the Popular Tales of the Western Highlands of Scotland.—Welsh Phonology, by the Rev. John Peter.—Le Mystère de Ste. Tryphine, par M. Reinhold Kœhler, conservateur de la Bibliothèque Grand-Ducale à Weimar.—Les nains dans les traditions de la Basse-Bretagne, par M. R. F. Le Men, archiviste du Finistêre.—Études sur la phonétique bretonne (suite), par M. d'Arbois de Jubainville.—Mythological Notes, by Whitley Stokes, Esq., &c.

Professor Michele Amari of Florence, of whom we lately gave an obituary notice, has written to say that he is alive and well. Our news came direct from Florence, through a person who was there with the intention of seeing Amari: we considered, therefore, that it might be relied upon. But instead of proving to Signor Amari, as Swift did to Mr. Partridge the almanac-maker, that, despite his own assertion to the contrary, he is really dead, we are glad to correct our blunder, and not less so to announce that the last volume of the Professor's *History of the Musulmans in Sicily* is to be finished this summer, after which he will commence an Italian version of his *Biblioteca Arabo-Sicula*. He is also contributing to the *Rivista Sicula* a series of notices of the Arabic inscriptions found in Sicily, illustrated with photographs.

The Royal Asiatic Society has just received as a present from Captain S. B. Miles, Assistant-Resident at Aden, another Himyaritic copper-plate inscription in beautiful preservation, consisting of eight lines and measuring 6½ in. by 4½ in.; besides two Himyaritic coins, a gold and a silver one, with Himyarite monograms, the first as yet discovered; also two gold Ethiopic coins, a small brass figure dug up at Mareb and supposed to represent a Himyarite god, and an iron amulet with Himyaritic characters engraven on it.

Dr. Stengel of Basle is preparing an edition of the *Roman de Durmart le Galois* for the Stuttgart Literary Society. The "Roman" is an O. F. poem of the "table ronde," containing 16,000 verses, and is curious in many ways. It has been copied from an apparently unique MS. at Berne.

A Philological Society has been formed in Cambridge, consisting of the following members: Professors Cowell, Kennedy, and Munro; Mr. W. G. Clark and Mr. Jebb, of Trinity; Mr. F. A. Paley, Mr. J. E. B. Mayor, and Mr. J. E. Sandy's of St. John's; Mr. W. W. Skeat and Mr. John Peile of Christ's; and Mr. Fennell of Jesus College. The society limits itself to the languages and literatures of the Indo-European family, as there has been for some time back a "Hebrew Society" which would not readily amalgamate with the society in question.

Mr. Frederick Muller, bookseller of Amsterdam, is in the possession of a collection of Hebrew and Jewish works, comprising about 2800 volumes, which he intends to sell *en bloc*. Amongst these books are a large number of the greatest variety and highest importance. This collection comprises, I. of Bibles and parts of the Bible, with and without commentaries, 280 vols.; II. Commentaries and Versions of the Bible and Parts thereof, 760 vols.; III. Talmud, 115 vols.; IV. Commentaries of the Talmud, 200 vols.; V. Rituals, 380 vols.; VI. Responses, 90 vols.; VII. Midrash, 25 vols.; VIII. Cabala, 80 vols.; IX. Sermons, 95 vols.; X. Liturgy, 150 vols.; XI. Philosophy and Ethics, 220 vols.; XII. Medicine, Astronomy, Geometry, &c., 30 vols.; XIII. Grammars, Dictionaries, Concordances, &c., 310 vols.; XIV. Geography, History, Biography, 225 vols.; XV. Belles-Lettres, Criticisms, Periodicals, Literary History, Bibliography, 225 vols. &c. &c.

Contents of Journals and Selected Articles.

Zeitschrift für vergleichende Sprachforschung, xx. 1.—Zur etymologischen Wortforschung, von Sophus Bugge. [Proposes a great many new derivations, especially Scandinavian. The following are a few of the most interesting:—Old Norse meiss, and cognate words in Lithuanian; Germ. roth, Sanscr. rohita, Lat. raudus (aes), rufus, from

rudh, to stream (?) ; ἔρευνα, Old Norse raun, trial ; Old Norse lé, from *lĕva, λήϊον, Sanscr. lu, to cut, reap ; Goth. laikan, to sport, Sanscr. reg, Lat. ludere ; Old Norse lauðr, Eng. lather, λούω ; losna, Lat. luna, Zend. raokhshna, bright, Old Prussian lauxnos, stars ; *f* for *v* in Latin—formica, μύρμηξ, Sanscr. valmîka ; formido, μορμώ, &c. ; forma, μορφή, Vedic várpas, later rupá ; fornix, οὐρανός, váruṇas ; Lat. sarcio, ῥάπτω ; ἄεσα, from sas, to sleep ; sudus, εὔδιος ; πτ for original *sk*, φθ for *sp* ; φθέγγομαι, φέγγος ; λ (in terminations) for *n*.]—Messapisches, von Moritz Schmidt. [Some proper names, Rudiae, Lupiae (Lecce) ; Dasumas, Δαζιμας, answering to the Lat. Decimus, may be added to Professor Max Müller's instances of softened *c* in Italian dialects.]—Reviews : Zimmer'sche Chronik, herausg. von Dr. K. A. Barack ; by Birlingen. [Of great importance for history, popular tales, and language.]—Benfey : Ueber die im Sanscrit mit *r* anlautenden Personalendungen ; by R. Roth. [The endings rantè, ranta, are 3 pl. pres. and impf. middle of ar, or, as Roth thinks, of ram, more exactly, ran.]—Die Ruhlaer Mundart, dargestellt von Karl Regel ; by E. Kuhn.—Pi*n*dapit*r*yagṇa, das Manenopfer mit Klössen bei den Indern, von Dr. O. Donner ; by E. Kuhn. [Contribution to the knowledge of Indo-Germanic ritual usage.]—Das Fremdwort, &c., von Aug. Boltz ; by E. Kuhn. [Condemned.]—Kleine Schriften von Jacob Grimm, 4. Band ; by A. Kuhn. [Reviews, &c., reaching over the years 1807–1826.]—(1) Fastus, "der Trotz" : [Θράσος, root dharsh] ; (2) Pectus [Sanscr. paksha, side-wing], von Michel Bréal.—Suffix -υγή, by E. Kuhn.

Göttingische gelehrte Anzeigen, Feb. 1.—Madvig's Cicero de Finibus. Ed. ii. [Reviewed by O. Heine in a highly appreciative spirit. After a well-deserved encomium on Madvig's first edition, as marking an epoch in Latin Philology, the reviewer shews the various ways in which the second edition is an improvement on its predecessor, more especially through Madvig's judicious use of the critical labours of Baiter. He regrets, however, that the exposition of Cicero's philosophical ideas is left in pretty nearly the form in which it originally appeared thirty years ago.] Feb. 22.—Index Aristotelicus. Edidit Hermannus Bonitz. [Reviewed by R. Eucken, with whose eulogy of this grand work we fully concur. Among the points to which he draws attention are—(1) the interpretation of the scientific terms in Aristotle ; (2) the articles on the proper names (from which we may get some idea of the influence exercised by his contemporaries and predecessors on Aristotle's mind) ; (3) the value of the Index to the critical student, as furnishing a synopsis of the peculiarities of Aristotelian phraseology—a matter on which Dr. Eucken is a well-known authority.]

Philologischer Anzeiger, vol. ii. part 12. (Principal articles.) Aristoxenus rhythmische und metrische Messungen, von Bernard Brill. Rev. by Fr. Susemihl. [The book is directed against Westphal's theory of ancient Rhythmic, but, in spite of some correct observations, is a failure.]—A. Conze : Beiträge zur Geschichte der griechischen Plastik. [Chiefly relates to the Attic artists before Phidias, and to Polycletus.]—A. Conze : Zur Geschichte der Griechischen Kunst. [Traces the Greek ornamentation beyond the period of Asiatic influence, to a highly peculiar system of lines which is found again in Northern antiquities. The conclusion is that we have before us an art which is the common property of the Indo-Germanic peoples.]—Die Sage vom trojanischen Kriege in Bearbeitungen des Mittelalters, von Dr. H. Dunger. [Most versions are mainly derived from the *Historia de excidio Trojae* of Dares Phrygius, but other sources were used.] Vol. iii. part 1.—R. Westphal : Methodische Grammatik der griechischen Sprache, i. 2. By H. D. M. [Takes exception to some parts of the theory given of the verb.]—Eduard Lübbert : Die Syntax von *Quom* und die Entwicklung der relativen Tempora im ältern Latein. [Proves and works out the view that in Plautus, and probably in Terence, *quom* does not of itself govern the subjunctive.]—W. Weissbrodt : Specimen grammaticum. [On the doubling of consonants : chiefly epigraphical.]—M. F. von Jaborneg-Altenfels : Kärnten's römische Alterthümer. [Meritorious, but without much special knowledge.] G. F. Schömann : Hesiodi quae feruntur carminum reliquiae. [Convenient small edition.]—Otto Kreusler : Observationes Theocriteae. By E. v. L. [Deserves attention.] Jules Girard : Le Sentiment religieux en Grèce d'Homère à Aeschyle. By L. G. [Most successful on the æsthetic side of the subject.]—R. Pilger : Ueber die Athetese des platonischen Sophistes. By L. [Defence of the dialogue against Schaarschmidt.]—W. Onchen : Die Staatslehre des Aristoteles : Id. Aristoteles und seine Lehre vom Staat. By Fr. Susemihl. [Suggestive and interesting work : mainly on Aristotle's criticism of the Platonic and other ideal states.]—Rettigii Catulliana. By E. v. L. [The reviewer insists on the importance of Terpander's musical divisions for Catullus, as well as for Greek elegy.]—Ad. Holm : Geschichte Siciliens im Alterthum. 1. Band. [A valuable work, although with some defects of plan and execution ; the general connection is somewhat buried in details.]

Zeitschrift der deutschen morgenländ. Gesellschaft, vol. xxiv. No. 4.—On the Shîite poet Abu-lḳasim Moḥ. Ibn Hâni', by A. v. Kremer.—Scholia of Bar Hebræus on Gen. xlix. 1., Ex. xiv. xv., Deut. xxxii.–xxxiv., and Judg. v., by R. Schröter.—Extracts from Dschâmî's Love-poems, with metrical translations, by F. Rückert.—The Adverb כאן, by Dr. Zunz.—List of the Magdala Collection of Ethiopic MSS. in the British Museum, by W. Wright.—On Surnames among the Arabs of the Maghrib, by Baron v. Maltzan.—On the Æthiopico-Himyaritic war, by F. Prätorius.—On Tibetan Words and Names in Huc's Tartary, by H. A. Jäschke.—A Himyaritic Sepulchral Monument, by W. Wright. [Corrections of lithograph on p. 178.]—On the Discovery of the Moabite Inscription, by H. Petermann. [Describes the efforts of Mr. Klein to obtain the stone ; a contract was actually made with the Sheikh of the Beni Hamide for its purchase.]—Additamenta on the Inscription of Mesha, iii. iv. v., by C. Schlottmann. [See elsewhere.]—On the Gypsies, by A. Mordtmann and A. F. Pott. [*Apropos* of Paspati's new work.]—Notes and Letters.—Review of "An Old Pahlavi-Pazand Glossary," &c., by E. Sachau.

Journal Asiatique, vol. xv. No. 58.—Études bouddhiques. Les quatre vérités et la prédication de Bénarès. Par M. Feer.—Nouvel essai sur l'inscription de Marseille, par M. J. Halévi. [Perhaps the best interpretation yet given ; the Phœnician words are explained uniformly from the Hebrew, except in the case of two Aramaic words, and the double negative איבל, which is compared with Æthiopic *enbala*, "without." The inscription of Carthage, which illustrates and is illustrated by that of Marseilles, is appended.]—Nouvelles et mélanges ; M. Oppert on the Moabite Inscription, &c.

Zeitschrift für die öster. Gymnasien, xxii. 1.—J. Vahlen : Horace's Letter to Augustus. [Explanation of Hor. 2, Ep. i. at some length : criticizes the arbitrary alterations and transpositions of Lehrs and Ribbeck.]—J. Vahlen : Qu. Ennius und Plautus. [On Ennius' Iphegenia, p. 123, ed. Val., against Fleckeisen.]—J. Kviçala : Rev. of Wecklein's, Ars Sophoclis emendandi. [Industrious collection of materials, but his conjectures and emendations often unnecessary and demonstrably wrong.]—O. Lorenz : Rev. of Geschichtsquellen der Provinz Sachsen. [Carmen occulti auctoris, and Chronicon Sampetrinum (13th and 14th centuries). Discusses relation of the Chronicon to the Chronicon Thuringicum Viennense, and to a compilation edited by Wegele.]

Jahrbuch für Romanische und Englische Litteratur, vol. xi. part 4.—Contents : Felix Liebrecht : Cyprische Märchen. [Eight sagas of Cyprus, selected and translated out of the third volume of the Κυπριακά, by Athanasios Sabellarios, Athens, 1868 ; cf. Gött. Gel. Anz. 1869. A few notes facilitate the identification of these sagas with such known among other peoples.] Hermann Fruust : Ueber den Grundtext der Bocadas de Oro. [These Spanish golden sayings, of which the same scholar had treated in the tenth volume, p. 171 f., are according to him of Arabic origin, as well as the Latin version, of which a fragment is preserved in the Arundel MS. 123 of the Brit. Mus. But the Arabic original has not yet been discovered.]—A. Mussafia gives a critique of the important important publication "Delle rime volgari Avattato di Antonio da Tempo giudice padovano composto nel 1332 dato in luce integralmente ora la prima volta per cura di Giusto Grion," Bologna, Gaetano Romagnoli, 1869. [The critic is in the whole favourable.]—Bibliographie of the year 1869 :—I. French literature, by A. Ebert. II. English literature, by L. Lemcke. III. Italian literature, by A. Tobler. IV. Spanish. V. Portuguese. VI. General literature. VII. Philology. VIII. History of civilisation, by L. Lemcke. [Short valuable notes and references are frequently appended to the titles.]—Title and index of the 11th volume.

On Thibaut's Jaṭapaṭala, by Benfey, in Lit. Centralblatt, Feb. 22. [Favourable.]

On Ahlwardt's Six Arabian Poets, by Lagarde, in Götting. gel. Anzeigen, March 8. [Points out one Hebrew word (*irân*, Tharafa 4, 12, = ארז), one Syriac, six or eight Greek, and thirteen Persian, scattered in the Arabic texts.]

Abstract of Dr. Haug's paper on Vedic accentuation, in Trübner's Record, Feb. 28.

New Publications.

Bibliotheca Geographorum Arabicorum ; ed. M. J. De Goeje. Pars prima. Viæ Regnorum, descriptio ditionis Moslemicæ, auctore Abu Ishák al-Fárisí al-Istakhrí. Leyden : Brill.

Codicem Manuscriptum Digby 86. in bibliotheka Bodleiana asservatum descripsit, excerpsit illustravit E. Stengel. Halle : Waisenhaus.

Delbrück, B. Der Gebrauch des Conjunctivs und Optativs im Sanskrit und Griechischen. Halle : Waisenhaus.

Ibn-El-Athiri. Chronicon quod perfectissimum inscribitur. Vol. V. Edidit Tornberg. Leiden : Brill.

Spiegel, F. Erânische Alterthumskunde. 1er Band. Leipzig : Engelmann.

THE ACADEMY.

"Inter silvas Academi quærere verum."

Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance.
The Editor of The Academy *cannot undertake to return communications which are not asked for.*
The next number will be published on Monday, May 1, and advertisements should be sent in by April 26.

Subscribers to THE ACADEMY who find it difficult to receive the numbers regularly through the newsagents may secure their regular delivery on the day of publication, post-free, by order to the publishers, at 12s. per annum, or 6s. for 6 months, payable in advance.

General Literature.

Critical Miscellanies. By John Morley. Chapman and Hall, 1871.

It would be generally admitted, outside the school of Tübingen, that the pagan literature of the second century was freer, richer, and more interesting than the Christian; yet the Christian literature was the more important, for it was the meagre and immature expression of ideas which were gradually swallowing up all the earnestness there was left in the world. It would be a poor compliment to one of the most accomplished essayists of the day to put Mr. Morley on the same level of literary interest as the fathers of the second century; but in him as in them the literary interest is secondary. The primary importance of these full and thoughtful essays is that they are applications of a doctrine which the majority of educated men regard, perhaps with better reason, with something of the angry contempt with which Marcus Aurelius regarded Christianity, and which in spite of their contempt is making progress which they ought to find alarming. Of this doctrine the author is indeed a very independent adherent: he rejects not only Comte's factitious revival of the externals of Catholicism, but also by implication his limitation of speculation by supposed social exigencies; but upon first principles he does not separate himself from the master. It would be easy and pleasant to judge him by those parts of his work where his insight and acuteness display themselves apart from any system; but he himself would probably refuse to be appreciated apart from his doctrine. Most essayists are like performers on the flying *trapèze:* it is waste of time to criticise their standpoint; indeed to make the parallel complete, we ought to suppose that during the performance the supports of the *trapèze* are being dragged about by wild horses out of sight. The worst that any one can say of Mr. Morley is that it is a curious thing to cast anchor upon a Kraken *because* you have watched it rise. To say nothing of the other difficulties of his method; he seems to us to fall into the double paralogism of using relative ideas as other people use absolute, and supposing that ideas must be permanent because they have a provisional value at the present day. Thus in the course of the book he gives two or three not very consistent but strictly relative descriptions of justice; and then in the appendix assumes that women ought to have votes because it is just. In the same way he assumes that because modern governments find it inconvenient to be bound by ecclesiastical considerations, the formula, a free Church in a free State, has a meaning, and can be permanently applied; or, to take an example that reaches further, that mankind can dispense with assumptions on the subjects on which men of science are at present increasingly disinclined to speculate. No doubt, as experience shows, it is very difficult to get on without attributing permanent and absolute value to one's ideas, but that is only an argument against ideas which in virtue of their *raison d'être* are compelled to disclaim those convenient attributes. Again, the standpoint of the author leads him to bestow an attention which most readers will think disproportionate on appreciating the precise extent of the contributions to the doctrines which he holds of the characters which he passes under review.

This leads to a somewhat excessive estimate of Vauvenargues and Condorcet. The former had thought over the same subjects as occupied Pascal's thoughts, and he had remained right-minded, and after such a hard life as he lived, this proves real strength and elevation of mind; among other things he thought the everlasting dualism between reason and passion, duty and inclination, mischievous; Comte thought he saw in this an anticipation of his own theory of the supremacy of the heart over the head. Such achievements are hardly sufficient to place a man on the level of such Moralists as Pascal or La Rochefoucauld, or even Bacon. It is very easy for a distinguished mediocrity to find good reasons for disagreeing with great men; the difficulty is to make his own moderation a power in the world capable of balancing their excesses, an object for which the world generally and wisely is content to trust to its own deadweight. Condorcet was doubtless the first to formulate the conception of progress in the sense in which it is used by the Positivists, though almost every writer since Locke had made free use of the less elaborate but hardly more inaccurate conception which is now the common property of liberal journalists. Such explanations as are possible of the transition from one period to another are probably facilitated by the hypothesis of something like a necessary succession of events, but they are only embarrassed and falsified by the further hypothesis that this succession consists of an uninterrupted though not equable series of improvements; especially as no formula has yet been devised to express the supposed improvement of a nature to bear developed statement, much less serious discussion. Each generation, in emancipating itself from the limitations of its predecessor, imposes new limitations on its posterity, and it is much more certain that the collective force of humanity is liable to fluctuate and to decline than that the increasing diffusion of its results represents an augmentation of its average intensity. This fundamental question is never examined, yet it deserved examination quite as much as the precise proportions in which Montesquieu, Turgot, and the deservedly neglected Physiocrats contributed to suggest what is not proved to be other than a platitude. The real value of Condorcet's work lay in its acute *aperçus* on comparatively secondary subjects, for it is much better to throw light on one or two periods than to misexplain all, and Mr. Morley perceives clearly how radical was the defect with which his hero's anticlerical passions penetrated the whole of his work. It is curious that Mr. Morley himself should be so ready to admit the justice of those passions, since the clergy of that period could hardly be charged with anything worse than sensuality and hypocrisy, and Condorcet was the eager apologist of both, while the clergy had at least the grace to be ashamed of them. We have no desire to attenuate the heroism of a man who could develop his Utopias so brilliantly and so industriously with death full in his face for nine months; but in spite of his heroism it is possible to overrate his peroration. He has been speaking of the thought of the future of the race: "This contemplation is for him a refuge, into which the recollection of his persecutors can never follow him; in which, living in thought with man reinstated in the rights and dignity of his nature, he forgets man tormented and corrupted by greed, by base fear, by envy; it is here that he

truly abides with his fellows, in an Elysium that his reason has known how to create for itself, and that his love for humanity adorns with all purest delights." Brave words of a brave man; but when we are told they embody a fervour as purely spiritual as Calvinism or Catholicism at their best, and infinitely less interested, we have to turn to the *De Imitatione* or *Rutherford's Letters* to make sure that we know what spirituality means, or even to the *Funeral Oration* of Pericles to satisfy ourselves that we comprehend wholesome, hearty, unsophisticated enthusiasm which feeds on things, not on words; on facts, not on fancies.

Like Vauvenargues, Joseph de Maistre lived a hard life cheerfully: but his cheerfulness proceeded from religious faith, not from stoicism. The difference expressed itself not only in their lives but in their view of life. The stoicism of Vauvenargues comes out more clearly in nothing than in his contented acquiescence in the wickedness of most of his neighbours, which he hardly expected to alter and thought it mischievous to dwell upon. De Maistre could not think it "a perfection of men" to be capable of "being content with imperfection," and therefore it was impossible for him to accept the world as he found it as contentedly as Vauvenargues, even if the universal convulsion which he witnessed had not forced him to reflect upon the condition to which it was due.

It is a curious question whether, if De Maistre could have read Mr. Morley's paper, which states with exceptional completeness and liberality the ordinary progressist's view of the great reactionist, whether he would not have regarded such a respectful attempt to put him quietly out of the way as really more insulting than a passionate onslaught like his own upon Bacon. At least he regarded Bacon as a real power to be reckoned with, while liberals regard ultramontanism as an obsolete theory to be classified and a fact to be pulverised as mechanically as possible. This leads to a rather onesided appreciation of men like De Maistre, who is allowed to be a great publicist of a lost cause, to avoid the necessity of answering him as a great theologian, appealing to a series of events which has never been disproved and an order of facts and feelings which seems likely to be permanent. As it is, it is hardly a caricature to say that Mr. Morley sometimes writes as if De Maistre's claim to remembrance was that he had invented ultramontanism in order to save civilisation. His criticisms in detail are sometimes just, as when he points out the tendency which De Maistre shares with most if not all apologists of Christianity to explain away its promises; at other times they are inadequate, if not captious. The aphorism that when a point has been established by its appropriate proof insoluble objections to its truth may be disregarded deserves to be examined seriously, not to be dismissed with a surmise that De Maistre invented it in order to construct a theory "under which the communities of men might find shelter." We are quite unable to see any inconsistency between the theory that earthly prosperity is distributed upon fixed conditions which it is easier for honest men than rogues to satisfy, and the further theory that original sin is the reason why these conditions are hard for both. Whatever either theory may be worth, they complete each other as their author intended they should.

The essay on "Some Greek Conceptions of Social Growth," the only one in the volume which has not appeared wholly or in part before, is on the whole the weakest in the series; it is the record of a voyage of discovery in a country which the writer supposes to be as unfamiliar to others as it evidently is to him. This unfamiliarity must be taken as an excuse for the regret that Greek philosophers did not go on hatching systems of society after society had collapsed in Greece. There is much that is suggestive, if little that is satisfactory, in the short but acute discussion of the development of morality. The writer believes that the only immutable element in morals is the conviction that such a thing as duty exists, and that the quality of the sentiment which this conviction inspires is invariable, and that the progress of morals consists partly in the fitful but progressive increase of this sentiment in quantity and partly in its improved application, so as to be distributed more accurately among a larger number of actions, which last kind of progress is clearly due to the advance of knowledge. It is not explained how an universal without content can be valid, or again how the sentiment which accompanies acts done under a sense of duty can be independent in quality of the character of the acts with which it is associated.

The best thing in the book is certainly the essay on "Carlyle," though even this is a little distorted by anxiety to claim the prophet for a precursor of the true faith. Perhaps also the literary defects of Carlyle's style are somewhat exaggerated, especially as his qualities are inseparable from them, and his reputation and influence only began with the writings where he allowed both to grow together. Nor are we always inclined to agree with Mr. Morley in all points where he agrees with Mr. Carlyle. Both for instance overestimate, if not the importance of the present crisis in England, both the urgency and the magnitude of the changes it demands: the history both of the Roman and of the Byzantine empire contain more than one example of the almost imperceptible reforms which are sufficient to enable society to begin a new career of prosperity. Both again overrate the worth of English Puritanism. Mr. Morley calls the Commonwealth the most elevating period of our national history, and actually believes that while James II. was overthrown by "an aristocratic faction grasping power for its order," Charles I. fell before "a nation rising and smiting its oppressor," in the face of the fact that the nation welcomed Charles II. to deliver it from the Puritan minority, and acquiesced contentedly for near a hundred years in the rule of different factions of "the Venetian oligarchy."

But the main positions of the essay, that Carlyle is the English representative of Rousseau, and that his permanent significance is as an antidote to Byronism, are a nearer approach than has yet been made to a final estimate of one of the most problematical personages of the day: and though we think that Bentham's labours in the "Scoundrel province of Reform" have so far been rather unproductive, it is always worth while to point out that the passionate unreason of Mr. Carlyle can never be other than barren. There is really a charming irony in the fact, which Mr. Morley is well qualified to certify, that Mr. Carlyle's present popularity is chiefly among the representatives of "Beaver industrialism," and it is certainly a decisive condemnation of his method that with all his hankering after "natural supernaturalism" he has only escaped accepting this as the practical outcome of his teaching by a blind idolatry of military force, which, as his critic well observes, is really more reactionary than the teaching of De Maistre, who would have been satisfied if we had gone back to the twelfth century, while Carlyle does not stop short of prehistoric barbarism.

The essay on Byron is a curious specimen of the essential similarity of all systems. An orthodox writer can never altogether resist the temptation of speculating upon what became of Byron's soul: Mr. Morley cannot refrain from asking how nearly he missed being an organ of humanity and an adequate representative of the modern spirit. The answer to these questions would have been more satisfactory if the writer had not recoiled from an examination of Byron's

personality—a task which it must be admitted has become intolerably unsavoury since Mrs. Stowe has imposed upon all who meddle with the subject the necessity of believing or refuting her "True Story." Still, without touching Byron's life, it might have been possible to extract Byron's character from his writings before attempting to fix the historical significance of his poetry. Such an enquiry would have modified Mr. Morley's estimate of Byron as "the genuine exponent of that immense social movement which we sum up as the Revolution." There is much force and insight in the way in which the parallelism between Byron's poetry and the spirit of the period is developed in detail; but the whole has to be taken with one important qualification. The men of the Revolution were with one exception perfectly well satisfied with themselves; they only rebelled against circumstances, against institutions, in fact against the world; even Rousseau, as great a self-tormentor as Byron, believed in Nature. Byron's rebellion was in the first instance a rebellion against what he found the constitution of his mind had got to be by the time he came to look into it. His revolt against religious and social orthodoxy was an afterthought; he set himself to defy if not to subvert their authority: because he said it condemned him as he was and as he felt himself compelled to remain. Apart from his remorse there is abundant evidence of his instinct to "consent unto the law that it is good." If he had not had an interest in palliating the evil in himself by exaggerating the evil in the world, he might have contemplated the irrationalities and littlenesses which he saw around him as comfortably as Gifford or any other respectable satirist. In fact, he makes some approach to this tolerant temper in *Don Juan*, which he wrote when remorse was giving way to lassitude.

After attributing Byron's defects to the lack of scientific culture, the author describes in a singularly beautiful passage what he conceives to be the healing effects of science approached in the positive spirit:

> "There is none of the baleful distortion of hate, because evil and wrong-doing and darkness are acknowledged to be the effects of causes, sums of conditions, terms in a series; they are to be brought to their end or weakened or narrowed by right action and endeavour, and this endeavour does not stagnate in antipathy, but concentrates itself in transfixing a cause. In no other condition of the spirit than this, in which firm acquiescence mingles with valorous effort, can a man be so sure of raising a calm gaze and an enduring brow to the cruelty of circumstance. The *last appalling stroke* of annihilation itself is measured with purest fortitude by one whose religious contemplation dwells most habitually upon the sovereignty of obdurate laws in the vast revolving circle of physical forces, on the one hand, and, on the other, upon that moral order which the vision and pity of good men for their fellows, guiding the spontaneous energy of all men in strife with circumstance, have raised into a structure sublimer and more amazing than all the majesty of outer nature."

This would be a seductive description if it did not apply, with the alteration of three words, to an older religion of humanity as it was preached in its original purity two thousand years and more ago. We know what Buddhism has become, a mass of flowery puerilities and unmeaning incantations, a narcotic as indispensable and as pernicious as opium to "the atheistic civilisation of China." After all those who differ on first principles must hear and say very often, "*Blasphemant quod ignorant.*" G. A. Simcox.

The Earthward Pilgrimage. By Moncure D. Conway. Hotten.

"'Tis a whole population of well-dressed men and women out in search of a religion," says Emerson somewhere, speaking of the world he knows. Such a "population" Mr. Conway, a disciple of Emerson, offers to lead—earthward. What doctrine, worship, or rule of life they may expect to find in the Terrene Religion seems but dimly indicated in this volume. Indeed, a simple Secularist might complain that Mr. Conway does not lead his readers earthward, but lounges at the roadside, railing delicately at the pilgrims moving in an opposite direction. The greater part of the book is occupied with a polemic against Christianity, of which the substance is in striking contrast to the form. The charges which Mr. Conway brings against the traditional religion of the Western world are as violent, one-sided, unqualified—and, I must say, unenlightened—as those of any open-air infidel lecturer; but they are uttered in a manner so refined and cultivated, so cool, disengaged, full of well-bred restraint, as almost to persuade us of their moderation. Mr. Conway's style is attractive enough to carry us, almost without tedium, through thirty-two short lectures, with no connection and much iteration. It is well imitated from Emerson's: avoiding the affectation and obscurity of the Angelic Lecturer, and the excessive comminution of thought, which makes his utterance a stream of glittering sand, hardly to be twisted into ropes by the most docile reader; but attaining the high intellectual vitality, the subtle, pointed, exquisite manner, the fertility in sparkling conceits, striking analogies and similes, happy historical allusions and anecdotes, and in general, the easy omniscience of its model. There seem to be few departments of knowledge with which Mr. Conway is not sufficiently familiar for rhetorical purposes. At the slightest occasion he will survey mankind from China to Peru, and gallop the thorniest paths of antiquarian criticism like a high-road. He has an imagination pleasantly fantastic and unfettered in its play, yet never parted from real insight; and often a stirring glow and winning delicacy of moral feeling. With these gifts, it is singular that Mr. Conway makes so few criticisms on Christianity which are either novel, subtle, sympathetic, or even fair. He devotes himself to enforcing such propositions as these: that bishops have a great deal too much money for preaching a carpenter's son's religion; that our learned advocates of Christianity are drugged with promotion and luxury; that the Ritualists cling to the Establishment for the sake of the loaves and fishes; that our religion generally is pervaded with a mercenary spirit, and our youth brought up to study "the law and the profits." The Church, we are told, among the elements of present society is conspicuous and solitary in its neglect of the poor. The "natural habitat" of Christianity, viewed scientifically, is ascertained to be a "sultry, uncomfortable desert." Against the Bible Mr. Conway's invective grows especially fiery. It has murdered "thousands of innocent persons as witches;" it has polluted the minds of our children with its obscene stories; it has maintained despotism, slavery, flogging; it is a Juggernaut to which the happiness of human beings is still continually offered. The polemic becomes almost ridiculous when the story of Cain and Abel is represented as a dangerous incentive to murder, and it is maintained that President Lincoln would scarcely have abolished slavery if he had not fallen in his youth under the wholesome influence of Tom Paine. The essayist might have recollected that we had abolitionists of our own, and that our thoughts would revert to Wilberforce. The theme of persecution, I need scarcely say, is treated with much eloquence. While we read, we feel as if thumbscrews and Smithfield fires were preparing for Dr. Colenso and Mr. Voysey. When we turn to our newspapers, and find that the question is whether a man who insists on teaching the opposite of what he is commonly believed to have undertaken to teach should suffer the horrors of dismissal, Mr. Conway's language seems antiquated. He himself has no objection to a little social persecution. He urges "scholars" to exclude from their social circle "the surpliced believer in Balaam's ass." In such

case, it would surely seem not extravagant in the surpliced gentlemen to retaliate by deposing the incredulous scholar from the office of Chief Pastor.

There is no doubt much truth in many of Mr. Conway's particulars; but the colouring and perspective are so false that the total effect is coarse caricature. For instance, if he were as subtle in taking as he is in expressing his points, he would have charged Christian churches not with neglect of the poor, but with acquiescence in pauperism, and discouragement or distrust of scientific effort to eradicate it. Again, the incongruities that result from the interpenetration of the Church and the World certainly attain a special grotesqueness in Anglicanism. That the leading preachers of the Religion of Self-sacrifice should be said to have "won the prizes of their profession" when they have attained dignity and luxury, is a fair subject for sarcasm; but when we have so many examples of educated men who devote themselves to the religion of Jesus without hope of gain, it is idle to accuse the mass of "successful" Christians of hypocrisy.

Again, few educated laymen would maintain that all parts of the Bible are adapted for family reading, or the Jewish view of witchcraft for civilised legislation; or that the attitude of early Christians towards the Roman empire and its institutions furnishes a good political model for modern Europe. Yet most men who have observed dispassionately the effect on the world of the consecration of Hebrew literature are surprised to find how little, rather than how much, harm has been mingled with the undoubted good that it has done; how wonderfully the moral instinct of mankind has, on the whole, protected them against their "exemplar" in so far as it is "vitiis imitabile."

It is hard to ascertain either the nature, proof, or place in human life of the creed for which Mr. Conway is so anxious to clear the ground. Sometimes it hovers on the verge of Pantheism; sometimes it catches a glow from the intense personal Theism of Parker. Sometimes it seems to place us in almost Epicurean independence of the Deity which we are yet to recognise: we are to trust and feel the Divine Love, but not to stultify ourselves by praying against an unalterable Destiny, or directing moral effort towards one whom we cannot benefit. "Religion is a man's duty to himself." Elsewhere, however, we are told that "the capitalist must feel that he is doling out pitiful and unjust wages not to Sullivan or Smith, but to Almighty God." It does not seem natural for the capitalist who has completed his Earthward Pilgrimage to feel this. There is only one essay in which Mr. Conway at all indicates an argumentative basis for his theology. He describes himself as explaining to some sceptical working men how we may infer from the love and thought within us analogous facts throughout the universe; their relation however to the universe we cannot ascertain. However, the laws of the universe are great and good, and by sympathy with these we ourselves become good and strong. One can conceive a contemplative person of culture deriving much elevated pleasure from such thoughts as these. But when he has evaporated religion to a shadowy aspiration or unverifiable metaphysical inference, and denied it its natural expression in service and offering, he cannot expect it to retain its potency to stimulate or restrain action. In some passages again it is intimated that we ought not so much to seek for a religion as to trust that Providence, or rather the laws of Nature, will send us one. "The new seed will shape itself into sufficient branches and leaves; the rain will not cease, nor the sunshine." These sudden gleams of optimism rather puzzle us. We do not understand why a man so discontented with the present should be so placidly reliant as to the future. Nature, no doubt, produces religions adapted to different ages and countries; but what Nature has given us in this year of grace 1871 is the Church of England, with her venal pulpits and overpaid bishops. Grant that it is ill-suited to the enlightened intellect: we do not perceive that Nature studies the tastes of the *élite* in the social organs and processes to which she gives birth. Grant that it is decrepit and decaying: why should we not trust the laws of the universe to destroy as well as to construct? Nature does not get rid of the old till the new is ready. It is trite to show that religious customs and costumes have continually changed, and that the old fashions always seem uncouth to the new time; it remains true that in no previous age have men ever calmly stripped themselves of the vesture of their beliefs, and danced gaily off in spiritual nakedness, to such piping as Mr. Conway's. If perfect emancipation from "Precedent and Dogma" is really to prove a panacea for our social ills, the result will be a supreme instance of Nature's surprises.

In a few lectures some social features of the new terrestrial Jerusalem are dimly sketched. The writer's breadth of view, warmth of sympathies, and flowing eloquence render the sketch sufficiently attractive. There are to be as few laws as possible, except laws of Nature: all are to be free and equal, especially women; no one is to regulate any one else; but all are to be (through secular education) willingly enlightened and spontaneously harmonious. This democratic Eden is as curious a contrast to Comte's ordered Utopia as the shadowy Theism of Mr. Conway is to the "demonstrated faith" by which certain other pilgrims offer to guide our steps earthward.

Henry Sidgwick.

LITERARY NOTES.

The *Westminster Review* for April opens with an essay of much spirit and originality on the genius of Aristophanes. The writer is peculiarly happy in bringing out the magic of those bursts of intense poetry with which the Aristophanic burlesque is interspersed, and in insisting on the spectacular or operatic character of the whole exhibition. What is singular in the article is the space which it devotes to the discussion and justification of the moral grossness of Aristophanes. Having taken as the key-note of his criticism Heine's phrase of the *Weltvernichtungsidee*—the riot of the imagination in setting all human relations topsy-turvy—he at one time brings under this idea the orgiastic animalism of the old comedy, and at another explains the animalism as consonant with normal Greek manners, especially (in regard of its Dionysiac source) with established religion. The apparent contradiction of these two accounts the writer does not seem to have recognised as calling for reconciliation.

Among the literary events in Paris is the extinction of the liberal Protestant paper, the *Lien*, and the appearance of a new political, philosophical, and literary journal, *La Renaissance*. The address to the reader thus describes the principles on which France may be regenerated:—"Ne te laisse plus conduire ni par un monarque, ni par un clergé qui, tôt ou tard mais infailliblement, te meneraient de nouveau à ta perte. En toutes choses, pour ton gouvernement comme pour ta foi, pour le ciel et l'avenir comme pour la terre et le présent, si tu veux renaître et vivre, fais tes affaires toi-même."

Dutch literature, which really deserves to be more studied than it is at present, has for its *Revue des Deux Mondes* an ably conducted monthly magazine called *De Gids* (The Guide). The April number contains a clear and forcible exposition of the method and results of comparative mythology, in which among other objections those of the *Edinburgh Review* are met and answered; also a warm appeal in behalf of Mr. Hare's system of representation; an account of Spinoza's *Korte Verhandeling;* and a paper on the state of singing in Holland—a country which "in the fifteenth and sixteenth centuries was the most musical in Europe."

The *Sacristy*, a quarterly which appeared last month for the first time, is a magazine wholly devoted to the interests of the elder children of the Anglican Church. Not only are the contents strictly ecclesiastical in character, but even the advertisements are confined to memorial brasses and works written on church principles. It will therefore be obvious that the articles which it contains cannot fairly be subjected to those rules of criticism which would apply to work done in the open grounds of literature. It can but be said that the contents of the present number prove that the editor has at his disposal contributors who show a fair measure of intelligence and literary skill. Herr Eckl's paper on "Christian Symbolic Zoology" displays some reading, and Mr. Heaton's "Hints on Colour for Decoration" are not only excellent in themselves, but so clearly and intelligibly put that they will be readily understood by the beginners for whom they are intended.

The first part of Mr. Haye's translation of Taine's book on Intelligence noticed in the *Academy* (vol. i. p. 290) has been issued separately, as the suspension of communication with France has retarded the work. So far as it has proceeded the translation is very satisfactory. It is to be completed in May.

Mr. W. G. Palgrave begins a series of "Arabiana" in the current number of *Fraser*, with a very interesting sketch of 'Omar, a poet, who flourished under the Ommiadæ at the culminating moment of purely Arabian civilisation, before the aristocratic culture of the Arab race had been destroyed by the egalitarian despotism which is the natural fruit of the Coran.

Señor Amador de los Rios, in the last number of the *Revista de España*, has commenced a very interesting series of essays on the famous Constable Alvaro de Luna—

> "Spain's haughty Constable,—the true
> And gallant Master, whom we knew
> Most loved of all."

Alvoro de Luna was an able, resolute, and patriotic statesman; an enterprising and successful captain; and the leader of a court in which most of the best poets of that age were, as Lope de Vega remarks, great lords, constables, admirals, and kings. The great Constable was the author of an unpublished prose work, dated 1446, *On Virtuous and Famous Women*, to which Juan de Mena wrote a preface. It is not, as its title might seem to indicate, a translation from Boccaccio, but an original work of the Castilian minister when at the height of his power. The great interest of the essay by Señor Amador de los Rios is caused by the view he gives of the political and social opinions of the Constable, derived from a study of the above work. The patriotic sentiments of Alvoro de Luna were of the loftiest and most self-sacrificing kind, and he denounced tyrants who attempted to rule in defiance of the law; though he considered the prosperity of the State to be impossible without the supremacy of royal power. This policy accounts for his fall; which was caused by the insatiable thirst for vengeance of the Spanish grandees. The patriot's death was a decisive triumph of a middle-age aristocracy.

In the number of the *Revista de España* for March 25, Señor Fulgosio gives some additional notes for the history of Galicia. He discusses the events connected with the destruction of the treasure fleet in Vigo harbour, by the English in 1702, in some detail. A company was recently formed for raising the treasure supposed to have gone to the bottom in the Spanish ships; but Señor Fulgosio conclusively shows that it was landed before the enemy arrived, and plundered by the country people in the confusion of the attack.

Don Emilio de Olloqui, a patriotic citizen of Vigo, has recently taken a very active and energetic lead in the promotion of measures for the improvement of that important Galician port, and with the completion of the system of railroads, a prosperous future may be anticipated for the cradle of Christian Spain, and for its commercial outlet at Vigo.

The recent republication of Lord Lytton's *King Arthur* has given occasion to the Rev. F. W. Farrar (in the *Fortnightly Review* for April) for what the average reader will think a strange escapade in criticism. Or rather he may accept the writer's own account of the matter, and decline to call it criticism at all. But then he will wonder why it should have been written, and how the author can have expected, as he evidently has, to reverse the general estimate of the poem by a mere discharge of superlatives in its behalf, proving no more than a confined personal persuasion of its excellence. It is true that he vouches for the sympathy of Shakespeare and Ariosto in his view; but even this testimony will fail to carry conviction in face of the quotations with which he has been ill-advised enough to furnish his pages.

Art and Archæology.

MACLISE'S CHARACTER-PORTRAITS.

There is much in the function of criticism which absolutely needs time for its final and irreversible settlement. And indeed some systematic reference to past things, now at length presenting clearer grounds for decision, seems a not undesirable section in any critical journal, which finds itself necessarily at the constant disadvantage of determining the exact nature of all grain as it passes with dazzling and illusive rapidity through the sieve of the present hour. Thus it might be well if a certain amount of space were willingly granted, in such journals, to those who, in the course of their own pursuits, find something special to say on bygone work, perhaps half if not wholly forgotten, yet which, for all that, may have in it a vitality well able to second any reviving effort when that is once bestowed.

Maclise stands, it is true, in no danger of oblivion; though he has lately passed away from among us with infinitely less public recognition and regret than has been bestowed, and that in recent cases, on painters infinitely less than he. His was a force of central fire whose conscious abundance descends at will on many altars, and has something to spare even for *feux d'artifice;* and it is fortunate that, after the production of much which, with all its vigour and variety, failed generally to represent him in any full sense, his wilful and somewhat scornful power did at last culminate in a perfect manifestation. His two supreme works—the "Waterloo" and "Trafalgar" in the House of Lords—unite the value of almost contemporary record with that wild legendary fire and contagious heart-pulse of hero-worship which are essential for the transmission of epic events through art. These are such "historical" pictures as the world had perhaps never seen before; bold as that assertion may appear in the face of the trained and learnedly military modern art of the continent. But here a man wrought whose instincts were absolutely towards the poetic, and yet whose ideality was not independent, but required to be exercised in the service of action, and perhaps even of national feeling, to attain its full development. These two splendid monuments of his genius, thus truly directed, he has left us; and we may stand before them with the confidence that only in the field of poetry, and not of painting, can the world match them as realised chronicles of heroic beauty.

However, my desire to express some sense of Maclise's greatness at its highest point is leading me away at the outset from the immediate subject of this notice, which has to do merely with an early and subordinate, though not ephemeral, product of his powers. I allude to the long series of character-portraits—chiefly drawn on stone with a lithographic pen, but in other instances more elaborately etched or engraved—which he contributed (under the pseudonym of "Alfred Croquis") to *Fraser's Magazine* between the years 1830 and 1838. Some illustration of Maclise's genius, in the form of a book ready to hand, and containing characteristic work of his, would be very desirable; and I am not aware that any such exists at present. If unfortunately the original plates of these portraits have been destroyed, they are exactly such things as are best suited to reproduction by some of the photo-lithographic processes, and I cannot doubt that by this means they might be perfectly and permanently recovered and again put in circulation. I suppose no such series of the portraits of celebrated persons of any epoch, produced by an eye and hand of so much insight and power, and realized with such a view to the actual impression of the sitter exists anywhere; and the period illustrated possessed abundant claims to a worthy personal record. Pre-eminent here, among literary celebrities, are Goethe, Walter Scott, Coleridge, Wordsworth, Charles Lamb, and Thomas Carlyle. Each produces

the impression of absolute trustworthiness, as in a photograph. The figure of Goethe alone, though very vivid as he gazes over his shoulder with encountering unreleasing eyes, is probably not derived from personal observation, but reproduced from some authority—here surpassed (as one cannot but suspect) in clear directness of rendering. The portrait of Scott, with its unflinching enjoyment of peculiarities, gives, I have no doubt, a more exact impression of the man, as equipped for his daily life, than any likeness that could be met with. The same may be said of the "Coleridge"—a mournful latter-day record of him, the image of a life subdued into darkness, yet survived by the soul within its eyes; and of the "Wordsworth"—beneficently enthroned, as if for the distribution of some order of merit to encourage the forces of nature; while Lamb, on the contrary, is shown to us warmly ensconced, sucking at his sweet books (and some other sweets) like a bee, and only conscious of self by the thrills of that dear delight provided. As for our still living glory, Carlyle, the picture here given of him, in the simple reserved strength of his earlier life, convinces us at once of its priceless fidelity. Fortunately this portrait is one of those most carefully modelled and engraved, and is a very beautiful complete piece of individuality. This, no doubt, like some others, is a direct portrait for which the original actually stood; while many, on the other hand, are reminiscences, either serious or satirical, of the persons represented.

It would be vain, in such space as I have at disposal, to attempt even a summary of the numerous other representatives of literature here gathered together; from the effete memorial effigy of Rogers, to Theodore Hook, jauntily yet carelessly posed, and with a twinkling, self-loving face, which is one of the special masterpieces of the collection. But I may mention, almost at random, the portraits of Godwin, Leigh Hunt, Cruikshank, Disraeli the elder, and the Arctic voyager Ross, as presenting admirable examples of the series. To convey a correct idea of the manner of these drawings to those who have not seen them would be difficult. Both in rendering of character, whether in its first aspect or subtler shades, and in the unfailing knowledge of form which seizes at once on the movement of the body beneath the clothes and on the lines of the clothes themselves, these drawings are on an incalculably higher level than the works of even the best professional sketchers. Indeed no happier instance could well be found of the unity, for literal purposes, of what may be justly termed "style" with an incisive and relishing realism. A fine instance, though not at all an exceptional one, is the figure of the poet Campbell, leaning back in his chair for a few whiffs at his long pipe, amid the lumber of an editor's office. The whole proportions of the vignetted drawing are at the same time so just and fanciful, and the personage so strongly and unflinchingly planted in his place, that the eye and mind receive an equal satisfaction at the first and last glance. Kindred instances are the figures of Jerdan and Galt, both equally admirable. Of course, as in all cases of clear satisfaction in art, the gift of beauty, and no other, is at the bottom of the success achieved. I have no room to point to many instances of this, but may refer to one; namely, the rendering—whimsical, as in the spirit of the series, yet truly appreciative—of that noble beauty which in Caroline Norton inspired the best genius of her long summer day. At other times the artist allows himself to render character by playful exaggeration of the most obvious kind; as in the funnily-drawn plate of Miss Landon, where the kitten-like *mignonnerie* required is attained by an amusing excess of daintiness in the proportions, with the duly charming result nevertheless. The same may be said of the "Count D'Orsay," that sublime Avatar of the eighteen-thirties, a portrait no doubt as intensely true to impression as it is impossible to fact.

I have already spoken of the literary leaders represented. Here too are the kings of slashing criticism; chiefs of that phalanx of rampant English and blatant Scotch mediocrity: insolent, indolent Maginn; Lockhart, elaborately at ease; Croker, tasteless and shameless; and Christopher North, cock of the walk, whose crowings have now long given place to much sweet singing that they often tried to drown; and who, for all his Jove-like head, cloud-capped in Scotch sentiment and humour, was but a bantam Thunderer after all. Not even piteous inferiority in their unheeded successors can make such men as these seem great to us now. There they lie—broken weeds in the furrows traced by time's ploughshare for the harvest which they would fain have choked.

It may be doubted whether Maclise saw clearly the relative importance of all the characters he portrayed in this gathering. His instincts were chiefly those of a painter, not of a thinker; and moreover he was doubtless, as a young man then, a good deal under the influence of association with the reckless magazine-staff among whom he worked in this instance. Accordingly some of the satire conveyed by his pencil is now and then not in the best taste; though perhaps the only really strong instance of this is the laughable but impertinent portrait of Miss Martineau. Many are merely playful, as the "Siamese" version of Bulwer-Lytton at his shaving-glass; or that flush of budding Oriental dandyism here on record as the first incarnation of Benjamin Disraeli.

But one picture here stands out from the rest in mental power, and ranks Maclise as a great master of tragic satire. It is that which grimly shows us the senile torpor of Talleyrand, as he sits in after-dinner sleep between the spread board and the fire-place, surveyed from the mantel-shelf by the busts of all the sovereigns he had served. His elbows are on the chair-arms; his hands hang; his knees, fallen open, reveal the waste places of shrivelled age; the book he read, as the lore he lived by, has dropped between his feet; his chap-fallen mask is spread upward as the scalp rests on the cushioned chair-back; the wick gutters in the wasting candle beside him; and his last Master claims him now. All he was is gone; and water or fire for the world after him—what care had he? The picture is more than a satire; it might be called a diagram of Damnation; a ghastly historical verdict which becomes the image of the man for ever. This is one of the few drawings which Maclise has signed with his *nom-de-crayon* at full length; and he had reason to be proud of it.

But I must bring particulars to a close, hoping that I may have roused in such readers of the *Academy* as were hitherto unacquainted with this series, a desire to know it and an interest in its possible reproduction. This, I may again say, seems easy to be accomplished by photo-lithography, though I do not know myself which of the various methods more or less to be classed under that title is the best for the purpose. The portraits should be accompanied in such case both by the original magazine-squibs necessary for explanation, and by some competent summary of real merits and relative values as time has shown them since. And before concluding, I may mention that in the Garrick Club there is a sketch of Thackeray by Maclise, in pen or pencil (I forget which), evidently meant to enter into this series. It is Thackeray at the best time of his life, and ought certainly to be facsimiled with the rest in the event of their revival.

D. G. Rossetti.

International Exhibition of 1871.

(*To open on the* 1*st of May.*)

The permanent brick buildings erected for this important undertaking are very extensive. They reach from the great Conservatory behind the Albert Hall down either side of the large garden of the Horticultural Society to the remaining portion of the 1862 Exhibition erections, in which the portrait collections have lately been opened to the public, and where the Meyrick armour at present stands. These buildings contain two floors, communicating by ample staircases, and are entered by two wide approaches on each side—on the west from Prince Albert's Road; the east from Exhibition Road, on which side there is an additional building, the "French Court," erected to accommodate the industries and science of our neighbours, and which it is hoped they will fill, in spite of their national disasters and dissensions. This "Court," which will contain a Restaurant, the general Refreshment Rooms being in the south centre in the old 1862 premises, communicates directly with the upper floor of the Exhibition building proper, appropriated on this east side to the pictures of all nations. The corresponding upper floor on the west side is the gallery of English paintings: sculptures in marble being distributed along the floors, along with other Fine Art productions, breaking the length of line by many various groups, and in or near the centre of the eastern galleries is a division appropriated to reproductions. The principal object here is the stupendous cast from one of the gates of the Sanchi Tope, lately arrived from India, with a model of the entire Tope in soapstone. This cast of the gate gives the spectator a sense of the surprising magnitude and rich elaboration of the entire monument. Besides this, there are reproductions of Byzantine

mosaics, the S. George from Prague, and other early works. Below this entire east line of galleries is a series of apartments, or rather a long vista partially divided by arched openings. This large space is for the exhibition of earthenware, porcelain, tiles, and mosaics of all nations—England, as we might expect, bearing away the first place in excellence and the lion's share in point of space. Oriental productions are also placed here, carpets, &c. On the western side, under the English Fine Art galleries, the same vista of space is furnished with innumerable wheels and belts from a steam engine of enormous power, and is appropriated to machinery in motion, improvements in mechanics, models, implements, and metal works.

As yet this whole line is void; it will not be till nearly the opening that the machinery will be brought in, as it requires daily care and attention from the exhibitors of each article. The English Fine Arts galleries are at present the most complete portion of the entire arrangement, but there is no propriety yet in particularising the more prominent works. On the other side, the Earthenware galleries are very forward. Curious and interesting ware from Tangiers and Portugal stand alongside of the indian-red highly-polished clay from Egypt and Assoin. As yet we notice few examples from the Continent, nor any glass. But the Irish ware showing the faint metallic lustre will attract attention, and W. B. Simpson and Son's mosaic and tile productions are very remarkable. Of course all our great Staffordshire potters are strong. The two most perfect pieces yet placed, certainly among the most perfect porcelain triumphs in the world, are Minton's Vase with the Lovers surrounded by cupids, and Binns' two Vases with Maclise's Norman Conquest series of designs worked round them in enamel. Of course it is the art not the manufacture of these things that makes them priceless, and the names of the artists we will take care to celebrate in a future notice.

The French picture gallery is at the end of the line nearest the French "Court." Ample room has here been apportioned to our neighbours, but as yet little is done to fill it, one line of pictures being all now visible. There is a confident expectation, however, that a display worthy of the school and of the friendship of the two nations will be ready before the 1st of May. Meantime Düsseldorf, Munich, Weimar, Brunswick, Norway, Hungary, Italy, Rome in particular, all appear in forwardness, and one large gallery entirely given to Belgium is already hung. Many of the pictures are very large; some in a high degree sensational.

Van Lerius, the present Director of the Fine Arts in Brussels, exhibits "Godiva," a picture which cannot fail to be one of the leading attractions. The greatest work we noticed, however (only in such confusion, and among so many it is difficult to concentrate attention), is a large work by Emile Wauters, the subject being a young woman examined before a civic tribunal in the fifteenth century. Works in miscellaneous sculpture, plaster, architectural enrichment, &c. will be distributed under the long arcade or piazza looking on the Horticultural Gardens.

SOCIETY OF BRITISH ARTISTS, SUFFOLK STREET.

This is the forty-eighth annual exhibition of the Society. We have not visited it for years, and going to it now suggests sundry reflections which may be more worth record than our extended opinions of particular pictures. The Society of British Artists we observe severely handled by some critics, and we understand many artists as well as critics show it little respect. There is nothing so successful as success, and on the whole this society has not taken, or at least has not held, the high place it ought to have, as an independent body requiring only a fair field and no favour, affording the younger artists a place for exhibition and the elder ones who are not in the Academy an important united position. Why does it not receive respect, and why is this gallery not filled with all the best pictures done in England not exhibited in Burlington House? To answer this question is very difficult. Perhaps some quite external and accidental reason is at the heart of the matter, causing men to inaugurate new petty societies and cliques in the Egyptian Hall and Bond Street, instead of amalgamating with this larger and earlier established body of "British Artists." The legitimate reason would be that the Suffolk Street exhibition is already a bad one, but even this would be radically changed by the best of rising artists joining it: the real reason is it has got a bad name. Here is as much landscape talent, as many admirable works in that department, as in all our other exhibitions put together, except indeed occasionally in Burlington House; animal painters of eminent ability, whom we may as well mention at once—Ernest Griset (177), C. Jones (365), and J. S. Noble, Jun. (201); and genre painters equal to any we have perhaps, yet all these fail to give the collection importance. Criticism on the exhibitions in London is a matter of *on dit* and second-hand amateur opinion, and the writers judge exclusively by names. It is the same with the publishers of engravings, otherwise one of these gentlemen would rush to Mr. Haynes King, and instantly arrange for the publication of No. 78, "From one who loves me dearly," as a companion to Mr. Faed's "Lassie writing a love-letter on the top of a tea chest;" No. 100, by Edwin Roberts, "A Hard Case," would attract the crowd at Graves' window, dividing attention with "The Pet Pigeon" (174), by A. F. Patten. Is "A Nymph and Bacchanal" (139), by W. Salter, inferior to old Henry Howard's best works of that class? If not, the name of the painter should be held in equal regard.

The landscape painters we would particularly notice are numerous. "Moonlight" (401), A. Clint, the President of the Society, is a very successful realisation, and charming in colour. In other pictures by this artist we object to compositions instead of actual places, but in this "Moonlight" the arrangement of the scene is properly subordinate to the effect required. "Dawn in the New Forest" (196), by H. Moore; "Dewy Eve" (299), by G. Cole; "An Autumn Evening" (143), by J. Syer; and a "Summer Evening" (508), by A. Panton, all deal with the same sentiment, and all have a distinct character and a large degree of mastery. "A Welsh Stream" (405), by J. Peel, and "Pirates burning their Prize" (277), by J. Danby, are both noticeable works, admirable in several respects; also "Homeward Bound" (502), E. W. Downard; "Oyster Boats going out" (129), G. S. Walters; and "Retour au Port" (509), by J. J. Wilson. In these, especially in the last, there is a conventional commonplace in the manner of painting the water, but after all, it is about as good in its way as Stanfield's best seas used to be, and has a suggestion of fresh sea air. Among the water colours Miss F. M. Keys' "On Dartmoor" (700) is admirably felt, and exceptionally good in execution. Miss Gilbert's "Lady Macbeth" (710) deserves mention in the same room.

Besides the figure pictures we have mentioned, and a few contributed by the popularities of the day, we have "The Warrior's Cradle" (146), by Maclise, one of his works we believe not previously seen by the public; and two by A. B. Donaldson, "The Princess and her Seven Swan Brothers" being admirable in colour and invention. Messrs. Ludovici and Woolmer are in considerable force; but the "Death of Gaveston," the favourite of Edward II., by Valentine W. Bromley, is the only important historical subject in the collection. The absence of works of a poetic interest, or dramatic ability, is very marked; but it is only here as elsewhere, the intellectual calibre is narrow, and the standpoint not very high. The great defect of the exhibition is that it has too many pictures, half of them being detrimental, a defect perhaps inherent in the constitution of the Society.

EXHIBITION OF PICTURES BY ARTISTS OF THE CONTINENTAL SCHOOLS, FRENCH GALLERY, PALL MALL.

This is the eighteenth annual display of works by French and Belgian painters, and we cannot help thinking the slight change in the title, widening the range of the collection to "Continental Schools" a judicious one. Not that there are any other Schools represented than those hitherto seen on these walls, but the attention of the London public may be now supposed pretty well used up in French art as in French affairs generally. It is true "the love of our neighbours" in a certain sense is on the increase with us, an underground contagion has communicated a tone or flavour to the taste and professional bias of a few of our poets and painters; but this is rather the affectation of men who are exactly at the impressionable period of life, and the English masses equally with our most highly cultivated chiefs must remain unsympathetic to the leading characteristics of French art. Nothing is so distinctively national as taste in the plastic arts, and of all the arts, most truly so in painting, which reflects the public desires and views of well-being and beauty.

Greatly superior as the French are technically to us, we are quite certain that familiarity will not make their painters more highly appreciated by us; on the contrary, after the first admiration caused by excellent manipulation has ceased to surprise us, their motives, their views of love and lovable women, their amateur Orientalism, their exclusive atelier education, all make them antipathetic to a nature-loving public like ours. Moreover, the French artist has an exclusive regard for Paris, and if he remains in London or paints for London, will not produce his best; even so good an artist as M. Gerome, in the works he exhibited in this very gallery's Winter Exhibition a few months ago, and in the Dudley Gallery Water Colour Collection, was unworthy of himself. From the catalogue of the exhibition now under review, we learn that Daubigny, Robert Fleury, Gerome, Heilbuth, L. G. E. Isabey, Saintin, Yvon, are all in London, and many more whose talents are worthy of all respect. Without any inhospitable feeling or want of respect, we hope that the troubles of France may cease and relieve them from exile.

Turning to the pictures themselves, we find all over the walls things that excite more or less very pleasant and grateful feelings, but principally by their executive excellence. Among the landscapes, although these are not very numerous, are some of the most perfect and surprising realisations. "Une Plage de Villerville-sur-Mer" (7), C. F. Daubigny, is the simplest possible in materials, but truly masterly and charming in handling and style. "On the Coast of Schevening" (13), F. H. Kaemmerer, and its companion, "Friends or Foes?" (19), though nothing but a cannon on a carpet of snow, are perfect as far as they go. "Early Morning" (73), J. B. Corot, is full of colour, and painted with the artist's most rapid and powerful hand. "North Sea—Morning" (154), H. W. Mesdag, is an accomplished work by a new name. But more important figure pictures of the best class are unusually deficient. "A Chorister Boy" (16), by Henriette Brown, a life-size boy in scarlet, rubbing up a pewter or silver crucifix, is vapid in the extreme, the scarlet cassock alone having induced the painter to do the picture. "The Vision of S. Hubert" (24), by J. Gallait, a highly popular painter in this country, is incredibly commonplace and melodramatic. Even those pictures that produced a sensation at the Salon just before the war began will fail to do so here. The principal among these is "Gulliver fastened to the ground and surrounded by the army" (58), by G. J. Vibert, in which the great ability in depicting a serio-comic multiplicity of action among the Tartar-like Lilliputians does not interest for any length of time. Another is "Indecision" (44), by Saintin, which retains "Medaille," a talismanic word in Paris, on the frame; but while we admit the perfect workmanship, the extraordinary finish, and altogether admirable realisation and good taste, is so vacuous in subject—a young woman looking at the weather by the edge of a Venetian blind—that our wonder is changed into perplexity, to understand how a man who paints so well can find nothing else to paint. "Pages playing at Chess" (12), A. Guès, is exceedingly well drawn, and the background is a well thought out medieval interior. But we must confess that there is something in all figures in tight costume one sees on French canvasses that raises one's dislike somehow or other. There are, however, more lovable pictures here, female beauty of course occupying nine painters out of ten. "An Eastern Girl" (35), J. L. Gerome, is a leading example, though not an important one, by the master. It represents a very young woman, draped so as to intensify the supposed voluptuous impression. No. 151 is another "Eastern Girl" by C. Landelle, a good work in many respects, in spite of the smooth surface of the painter. We wonder how many Eastern Girls are annually painted in Paris, and fail to see any *raison d'être* for the whole of them. Then we have the usual *Conversational* subjects, or *Tableaux de Société*, for example, "Selecting a Flower" (33), F. Willems—all of them so beautifully painted and so vacuous. The finest things in this exhibition it appears to us are Josef Israel's productions, especially two, "Going Home" (8), and "A Cottage Madonna" (57). These are truly fine as art and also as emotional inventions. Alma Tadema's "In the Temple" is quite worthy of mention before closing our brief notice, and "Evening in Genoa" (101) is certainly one of the very best works in the room. It is full and rich in composition, tone, colour, and indeed is a picture of thorough accomplishment. The name of the painter, Jos Fluggen, is new to us.

William B. Scott.

Music.

NOTES ON MUSIC.

The noble "function" on the eve of Good Friday, for which, so it is said, we are indebted exclusively to the munificence of the Dean of Westminster, was attended by an enormous congregation. Not since the Middle Ages, possibly never, has so vast a crowd been gathered within the walls of the most interesting of English churches. The "Special Service" announced proved as remarkable for its "order" as for the means employed in its "administration." A portion of "Evensong" was followed by a selection from "The Passion of our Lord according to St. Matthew, set to music by John Sebastian Bach;" and this not by a few voices, and with the necessarily mutilated and imperfect accompaniment of the organ, but, after the design of the composer, with a large chorus and band of instruments, wind and string, each divided into two; these being placed not in a gallery, but, according to time-honoured church use, facing one another on stages gently rising from the floor. The chorus consisted of men and boys only, without exception surpliced; and by these the instrumentalists were slightly masked, though not avowedly hidden—for to have hidden them would have been, in a certain sense, to have stultified the whole proceeding; seeing that *their* presence was the chief novelty involved in it—a novelty which has, in our own time, struck the first blow to a superstition deeply planted in the English religious mind—that performance on pipes blown by artificial bellows, and set in vibration by putting the fingers on certain pieces of ivory and the toes on certain pieces of wood, may be an act of worship and may tend to edification, but that the inflation of pipes by human lungs and the setting in vibration of strings by certain motions of the human arm are acts necessarily worldly, not to say profane.

Four "grand original fantasias," for full orchestra, chorus, military band, &c.—the &c. proving to be *cannon*—were performed at "The Royal Alhambra Palace" in immediate succession on Thursday. They had been selected for trial from thirty-nine compositions of as many candidates for a prize of 200*l.* offered by the directors for the best work answering the description quoted above. In their views of the capabilities of music to describe or suggest any conceivable incident or sentiment, the four composers, to judge from their printed programmes, are thoroughly agreed. One has not been withheld from expressing, by musical sounds only, that "every house is illuminated;" another gives, through the same medium, the "preliminaries of peace," and even "sneers at the King of Prussia's proclamation" and "the Emperor Napoleon's declaration," which might have seemed without the functions of his art. In another view or intention the four, and no doubt th. thirty-nine, composers are altogether at one—that of getting the utmost amount of noise out of one of the largest bands (for the most part "military") ever got together. The choice of the "jury," fully confirmed by the suffrages of a large *invited* audience, fell on the third piece performed, which, on opening the sealed envelope containing his name, proved to be the composition of M. F. Van Herzeele, a Belgian band-master. It will of course at once be made a stock piece at the Alhambra concerts and doubtless prove attractive, being cleverly written and skilfully scored—no better proof of which could have been given than the attention with which it was received on Thursday by an audience already nearly deafened by two compositions of like duration and intensity.

Rossini's setting of the *Stabat Mater* is so recent and, whatever its faults or failings, so beautiful that the great body of musical amateurs might be excused having forgotten, even if they had ever known, that the most touching and popular of mediæval hymns has continually exercised the genius of musicians since anything that would now be called music has had existence. Not to speak of the remoter efforts of a Josquin or a Palestrina, a contemporary of Handel, Pergolesi, some of whose compositions still keep their places in public favour, has left us a setting the popularity of which in its own time is attested by very numerous editions; and, almost in the memory of living men, the father of instrumental music—the last of the fine arts to attain to anything like perfection—that further illustrated the various phases of feeling suggested by Jacopone in

music as varied and beautiful as it is thoroughly well made. A performance of this music occupied the principal portion of the "public rehearsal" given at the Royal Academy of Music on the 4th inst., and presented proof, if such were wanting, in the manifestly deep interest of a crowded audience, that, like innumerable works all but unknown to the present generation, Haydn's *Stabat Mater*, fairly interpreted, might hold its own in comparison with some even of the best of the very few compositions of its class which the public ever have a chance of hearing. It consists of no less than seven airs for each of the voices male and female—a duet, a quartet with chorus, and five choruses more or less intermixed with solos. The orchestration is of a kind that brings it within the reach of very moderate musical means. No wind instruments are employed save *corni di bassetti* or, in their default, *oboi*. So ingeniously, so tastefully, and so effectively, however, is the stringed quartet employed, and so various as well as beautiful are the musical ideas which it is employed upon, that even to the modern and somewhat exacting ear no sense is apparent of any shortcoming either in force or variety. The directors of choral societies will do well to turn their attention to this work, which, though susceptible of any amount of finish that can be given to it, presents no insuperable difficulties of execution, and will give great pleasure during its practice and preparation. A word—more to those as yet *in statu pupillari* would be unadvisable—of praise is due to the for the most part youthful performers to whom its revival is owing. The solos without exception were delivered with feeling and method; the chorus was faultless in time and tune, and singularly fresh in *timbre;* and the orchestra forcible or delicate, as force or delicacy was called for; exhibiting, too, a feeling for those they were accompanying very rare among young *virtuosi*.

Theology.

The Jesus of History. By the Right Hon. Sir Richard Hanson, Chief Justice of South Australia. London and Edinburgh: Williams and Norgate, 1869.

Two impulses have contributed of late years to render the life of Christ a fertile department of theological literature. In Germany, almost ever since Strauss's first *Leben Jesu*, a succession of critics has been occupied with researches into the origin of the Gospels, and the attempt to connect them with the earliest history of the Church. The progress already attained may be seen by comparing the first work of Strauss with the second, though the latter fails on some points to do justice to the present state of criticism. A second impulse has been given by M. Renan, who, not without a good acquaintance with German works, has been the first to renew the bold attempt to reconstruct the life of Jesus. Although in doing so he has often allowed too much play to the fancy, yet he has said much that is striking and stimulating, and has infused new life into the criticism and literature of the subject. The problem is one of the most difficult in history, not only because it is subject to the influence of religious opinion, but because few of the sources in their present form are direct or primary, and because the central point of this history is almost entirely beyond the range of observation and analysis. A knowledge of the facts seems only attainable by the twofold method of analysis and hypothesis. The foundation must be laid in an analysis, according to the strict rules of criticism, of the historical contents and the style of the documents. But this criticism cannot be carried out without drawing a distinct, though only probable, outline of the life of Jesus Himself, and of the course of the earliest Church history. Such an outline is a hypothesis, resting on observations made at the sources of our knowledge, and is the condition of making new and more exact observations, by which again the hypothesis itself may be confirmed, corrected, or even overthrown. Hence no work on this subject will now possess scientific value, unless it to some extent combines a critical examination of the documents, with an attempt to represent the history itself as a whole. *The Jesus of History*, closely connected as it is with the German and French literature on the same subject, is a proof of the international character of these inquiries. But it is in many respects quite original. The author has devoted the larger share of his attention to the task of setting forth the life of Jesus from a purely historical point of view, and of recovering, so far as is possible with existing data, the exact degree of knowledge possessed by the Jewish Christians before the fall of Jerusalem. We have followed him step by step, and cannot withhold our testimony to his strict and disinterested love of truth, as well as his calm and careful deliberation. With great conscientiousness, he has everywhere distinguished between what we can really ascertain and what we can only venture to accept as probable. For that very reason he has also in many cases confined himself to showing that on certain points nothing is known, and he carefully abstains from filling the void with dogmatic inferences or imaginative pictures. His style is free from all rhetorical pathos; it is the style of a sober, cautious, and reflective writer, who declines to work with any but given quantities. What more than anything else distinguishes his mode of treatment, is the care with which he detaches his views from all accustomed ideas and opinions, and seeks to transfer himself entirely to the mental position of the persons described. It may be true that he has not done full justice to the higher force of ideas, which, in the supreme moments of history, extend their sway far beyond a particular age; still a strictly practical estimate is desirable of the motives and plan which may conceivably have been present to the mind of Jesus. Such investigations were common in the early decades of this century, though now, perhaps, they are too much forgotten.

The work falls into three books. The first treats (1) of Judaism, (2) of the documents respecting the life of Jesus, (3) of the Synoptics, and lastly (4), under the title of "Probabilities," of some preliminary questions on points of detail. The investigations into the documents are supplemented by the fourth section of the second book, in which the relation of the first and the third Gospel is examined still more closely. As sources of information, the author recognises only the synoptic Gospels. He excludes the fourth Gospel on account of the lateness of the testimonies to it, the opposition between its contents and the point of view which the Epistle to the Galatians compels us to ascribe to the Apostle John, and the internal improbability, or rather the evidently unhistorical character, of many of the narratives contained in it. We cannot altogether approve of this treatment of the fourth Gospel, nor of the reasons assigned for it. Even the synoptic Gospels are hardly better attested than the fourth; and as to the position of John we learn scarcely anything from the Epistle to the Galatians. Nor is the character of the several narratives of the fourth Gospel really decisive. Granting the very extraordinary character of the narratives of the resurrection of Lazarus and the visit of Jesus to Samaria, still we may match each of these by several passages in the first Gospel, *e. g.* the sending of

the evil spirits into the swine, and the intercourse of Jesus with the publicans, &c. We do not deny that these Johannine narratives have an artificial air when examined in detail. Still this does not necessarily involve the condemnation of the whole Gospel. That this cannot be regarded as historical in the ordinary sense of the word is now all but universally recognised among scientific critics. But a careful examination of it reveals, above and beyond the undeniable influence of the ideas of its author, such a definite residuum of documentary material that the question forces itself upon us, how far we have here to deal with a historical tradition distinct from that of the Synoptics. This question is difficult to answer; indeed one may say that properly speaking its examination has only just begun, and we are very far from finding fault with those to whom the unavoidable impressions of the unhistorical character of the Gospel occur with irresistible force.

But we believe the author has not taken sufficient account of the other side of the question. Among the synoptic Gospels he gives the first place to St. Matthew. This, at least in its present form, he justly declines to regard as the original of Mark, or as in any sense an ultimate authority. The oldest Gospel was gradually added to, and in our Gospel according to St. Matthew, the original Judaistic and anti-Judaistic portions, he thinks, may still be distinguished. He connects with this the statements respecting both Gospels in Papias, and adopts the view that the Logia of Papias, as well as the "Mark" described by him, are combined in our "Matthew." This combination forms the basis of our present "Mark," but it was not till after considerable additions that it assumed the full form of our first Gospel. Some of the elements of this theory are no doubt correct. But it is founded far too much on merely general observations and conjectures, and thus is much less unassailable than according to the present condition of science it ought to be.

The relation between the two first Gospels can only be determined accurately by having recourse to the third. This is no doubt the latest of the three, but its author had certainly not our first Gospel before him, and probably not our second. Its coincidence with these can therefore only be explained upon the supposition that he was acquainted with some form of the documents upon which they were founded. In this way we may discover with a fair degree of certainty the original form of the Mark-record, and the form and modifications of the collection of the λόγια of the Lord ascribed to Matthew. There is still considerable variety of opinion on these questions, and therefore the author has some excuse for passing them over. But the omission is a defect in a scientific work, for a historical picture of the life of Jesus can only be based upon an exact determination of the contents of the earliest record, and not upon a merely arbitrary selection of passages, as Renan bases it, nor, as our author, upon a one-sided preference of a single Gospel.

Again, it is assumed that we have in our first Gospel the essential elements of the tradition received in the Church of Jerusalem, prior to the destruction of that city, and approved by the "pillar" apostles. There is much to be said against this view, and no direct evidence of its truth. All the records in use in the Judæo-Christian Church, were without doubt Aramaic. On the other hand, all investigations hitherto made into the language of our first Gospel have led to this double conclusion, 1. that it was originally written in Greek, and 2. that it is to be regarded as a perfectly independent version of the earliest records, and not a translation of them. The inconsistent character of the contents of the first Gospel has not escaped our author, who sets aside as later additions the doctrines of the rejection of the Jews and the extension of the Gospel to the Gentiles, on the ground that such views were impossible in the Jerusalem Church at that time. More accurate inquiries prove that the views on these matters which prevailed in the Jerusalem Church were by no means unanimously and continuously Judaistic. The fierce Jewish persecution which soon arose, and with brief intervals of respite broke out again and again, can only be explained upon the hypothesis that the Christians were regarded as the enemies of the Law; and this is confirmed in the most direct manner by the testimony of the Apostle Paul. Moreover, the prophecy of the destruction of the Temple and the decadence of the established religion, constitutes in the Synoptics such an integral part of the oldest tradition as can only be disregarded on the most arbitrary principles of criticism. These prophecies reveal circumstances, a state of opinion and expectation, totally different from those attributed to the earliest Church by our author. They supply us with a new means of estimating the oldest tradition respecting Jesus, and, indeed, the views which must be assigned to Him. Our author, on the other hand, in his chapter on "Probabilities," regards the exclusive Judaism which he attributes to the original Christian Congregation as the only direct result of the teaching of Jesus, and considers the passages in the Gospels which reveal a larger horizon, as of later origin. This is a mere assumption, unsupported alike by literary criticism and by history. This question, it should be borne in mind, may be decided quite independently of the conflicting theories as to the supernatural or merely human character which may be assigned to the teaching of Jesus. The extension of the Church beyond the Jewish nation may have been asserted by Him quite consistently, *e.g.*, with the truth of the latter of these theories.

In speaking of miracles the author asserts his right to subject them to critical investigation. He is correct, no doubt, in holding that in the interval between the death of Jesus and the formation of the earliest records miraculous stories may have grown up, and he lays stress on the very important fact that we have to deal with an age to which the belief in miraculous agency was natural, and that therefore the testimony of eye-witnesses, that they had seen miracles, amounts to nothing more than the testimony that they believed that they had seen them. In the section on "The Preaching of the Kingdom of Heaven," the author points out the distinction between two kinds of miracles attributed to Jesus, the cures, and the great miracles affecting the system of Nature. The former he is inclined to regard as having really occurred, and as explicable on the supposition of a peculiar gift in the operator, the historical existence of which in other persons and at other periods cannot be denied. In dealing with the latter, he holds that the explanation of such stories as gradual developments out of floating mythus into definite narrative, is both natural and legitimate, and relieves us from the violent alternative of fact or imposture. This seems to us a very fair argument, still it should always be remembered that a thoroughgoing distinction between the two classes of miracles cannot be maintained. Even the miracles of healing are only known to us through the medium of the views and beliefs of the eye-witnesses and the earliest narrators; it is now impossible to speak positively as to the actual occurrence. All that can be inferred with certainty from the collective evangelical tradition is that in some sense the healing of the sick formed part of the ministry of Jesus. But we will not dwell further on these objections. The observations of the author as to the value of this class of narratives, in which he shows that they are not to be taken as decisive proofs of a contemporary belief in Christ's Divinity, deserve the most careful consideration. He admits that the utterances of

Jesus himself on the subject of his miracles are not uniform, that while rejecting a faith which rests only on the evidence of "signs," Jesus expressly appeals to the testimony of his works. Difficult as it is to bring the several passages into complete harmony, their variety of expression may probably cover two facts, 1. That Jesus declined to give those particular signs which were expected of the Messiah, 2. That He pointed notwithstanding to His beneficent works as an evidence of His mission. C. Weizsäcker.

(*To be continued.*)

THE HEBREW TEXT OF PSALM LXXXVIII. 2 (1).

TO THE EDITOR OF *THE ACADEMY.*

Sir,—In the Authorised Version this verse appears to be quite simple and distinct: "O Lord, God of my salvation, I have cried day *and* night before thee." But the Hebrew text is not equally free from difficulty and obscurity; it is indeed faulty both in grammar and in rhythm.

Ewald translates:—

"O Jahve, meines Heiles Gott,
wann Tag's ich rufe, in der Nacht vor dir:"

Hupfeld:—

"Jhvh, Gott meiner Hülfe,
am Tage da ich geschrien habe—in der Nacht vor dir."

Hitzig:—

"Jahve, Gott meiner Rettung,
zur Zeit, dass ich schreie Nachts vor dir:"

The most literal rendering of the present text appears to be:—

"Jehovah, God of my salvation,
In the day that I cried by night before thee:"

which, of course, must be erroneous.

I venture to suggest the following emendation of the text:—

יְהוָה אֱלֹהֵי שׁוּעָתִי יוֹם
צָעָקְתִּי בַּלַּיְלָה נֶגְדֶּךָ

which, by a very slight alteration (viz. the omission of the initial י of ישועתי, which may have been but a repetition of the final י of אלהי), removes the faults of grammar and rhythm, restores the parallelism, and brings the verse into harmony with other similar passages in the Psalms, such as xxx. 3 (2)—

יְהוָה אֱלֹהַי שִׁוַּעְתִּי אֵלֶיךָ

Ps. xviii. 7; &c.

Glasgow, March 7, 1871. Duncan H. Weir.

Intelligence.

The death (March 16) of Prof. M'Gill, of St. Andrews, demands more than a passing allusion, as he was not only a promising Semitic scholar, but a valued correspondent of the *Academy*, and, in intention at least, a contributor to its pages. He was born in 1832 in the parish of Glenluca, Wigtonshire, and studied at the university of Glasgow. Whilst minister of the chapel of Sauchie, near Alloa, he gave all his spare time to the Semitic languages, particularly Chaldee. The results of his studies were partly embodied in an article on Biblical Chaldee in the *Journal of Sacred Literature*, the substance of which was afterwards transferred to Dr. Pusey's *Daniel*. Whilst at Sauchie he began to collect materials for a Chaldee Grammar and Chrestomathy, and it is hoped that some of his most valuable notes on Biblical Chaldee and the Targums may yet be published in some form. He was appointed to the Hebrew chair in St. Andrews in 1868. His loss is much felt, as he was not less liked as a man than admired as a scholar.

Contents of the Journals.

The Roman Catholic **Theologisches Literaturblatt** continues to set an example of learning and candour which our English reviews would do well to imitate. The two March numbers present us with able and candid critiques of the Life of Reuchlin by Dr. L. Geiger (son of the eminent Rabbi), and of Hase's Manual of Protestant Polemics. Dr. Kampfschulte recognises the solidity of Geiger's researches, though he questions whether the struggle of the Humanists was really for free thought, as the author represents. Dr. Reusch is equally appreciative (with some qualifications) of the merits of Hase, who is no bigoted Protestant, but allows the *raison d'être* of Catholicism. Dr. Langen notices Schegg's commentary on St. Mark, and shows at great length the early origin of the modern way of counting the hours; while Evelt reviews favourably the recent work of Schuerer on the Paschal Controversies.

In the **Theologisch Tijdschrift** for March, Prof. Hoekstra endeavours to confirm the theory of the late origin of Mark in its present form by the peculiar character of its Christology. Dr. Tideman discusses recent theories on the Essenes and Therapeutæ; he defends the historical character of the treatise On the Contemplative Life, and also of the Therapeutæ, which has been called in question by Kuenen. Mr. Tiele analyzes the contents of Dr. Muir's new volume of Sanskrit Texts, and Kuenen those of Merx's edition of Tuch's Genesis.

In the **Theological Review** for April, Mr. Mackay gives a sketch of the origin of Christianity as expounded by Baur; Miss Cobbe discusses Mr. Darwin's theory of the origin of the Moral Sense, and his doctrine of the nature of Repentance, which she rejects on the basis of psychology; and, to omit ephemeral articles, Mr. R. Martineau notices, perhaps too leniently, Dr. Williams' Hebrew Prophets, vol. ii., and Mr. Crowfoot's Fragmenta Evangelica.

In the **Götting. gelehrte Anzeigen**, March 15, H. E. gives a thorough and severe critique of Grätz's edition of Ecclesiastes. Prof. Lagarde reviews (April 5) Hartel's edition of Cyprian, and indicates the lines on which critical enquiry will have to move before a definitive edition can be produced; he recognises, however, the careful editing and provisional utility of Hartel's work.

In the **Literar. Centralblatt**, March 18, a high opinion is expressed (from a "liberal" Protestant point of view) of a R. C. work on the Psalms, which forms the first part of a popular commentary on the O. T. by various writers. Philological matter is relegated to appendices. (See New Publications.) Th. N. reviews (April 8) vol. ii. of Fürst's History of Biblical Literature, &c., a very extravagant work.

Science and Philosophy.

The Dialogues of Plato, translated into English, by B. Jowett, M.A., &c. 4 vols. Clarendon Press.

The high academical reputation of the Master of Balliol, and his early success as a writer of thoughtful and graceful essays, will have prepared scholars and men of letters to expect from him a complete and discriminating estimate of the merits of Plato and Platonic philosophy. The union of boldness with reverence which candid readers have recognised in his writings, in spite it may be of dissent from his conclusions, his subtle perception both of differences and analogies, above all his unquestioned zeal for truth and spirit of enquiry, seemed to guarantee the lovers of Plato against any want of sympathy with an author who exhibits all these qualities in their highest degree: while his long Oxford experience, and acquaintance with the shifting tides of Oxford opinion during periods of stormy controversy, afforded in themselves no indifferent training for the task he has just completed. It is hardly too much to say that in him—

αὐτὴν ἐδοκοῦμεν τὴν Ἀκαδήμειαν βλέπειν·

—we seemed to see an epitome of the university he adorns.

Nor has he frustrated these expectations, which we ourselves fully shared. The work as a whole is worthy of Professor Jowett's reputation. He has evidently spared no labour either in mastering the difficulties of his author, or in the less congenial work of comparing the conflicting theories of his predecessors, English as well as German, with the conclusions he may have been led to form by independent enquiry. This in itself is no mean praise, for those

who know how voluminous is the Platonic literature of Germany, on which every passing year leaves fresh deposits, can alone appreciate the industry and self-devotion, the love and power of work which have enabled a most assiduous college tutor and university professor to bring to completion so vast an *opus subsecivum* as the present.

A review of these bulky but handsome volumes, which, let us say once for all, are in every respect creditable to the Clarendon Press and its intelligent publishers, naturally divides itself into three heads. We propose to give some account, 1st, of Mr. Jowett's views on what is called the Platonic Canon, 2nd, of the order in which he conceives the dialogues ought to be arranged, and lastly, of the style and character of the introductions in which these topics are discussed. We shall also have a few words to say on the manner in which he has performed his self-imposed task of a translator. Under the first two heads it will be necessary to notice certain opinions concerning the Platonic philosophy which are not met with elsewhere, and which necessarily hang together with the question of genuineness and with that of arrangement.

1. Of the thirty-four dialogues recognised in the Alexandrian Canon, Mr. Jowett has translated twenty-seven. Of these he holds twenty-four to be certainly genuine, including in that number the *Parmenides* and the *Laws*, which some of the later German critics are disposed to condemn. Of the remaining three he speaks with hesitation, inclining, on the whole, to admit their genuineness, and thinking each worthy of a separate introduction. These are—the lesser *Hippias*, the greater *Alcibiades*, and the *Menexenus*. Of the greater *Hippias*, which he has not translated, he speaks still more doubtfully, deeming it *à priori* unlikely that Plato would publish two dialogues under the same title. The *Theages* and the second *Alcibiades* he condemns, with the *Erastae*, *Clitophon*, *Minos*, *Epinomis*, *Hipparchus*. The epistles he thinks equally spurious with the small dialogues (*Sisyphus*, *Axiochus*, &c.), that were rejected by the ancient critics. This last opinion is so decisively pronounced that we have no right to suppose that it was formed without careful examination; we regret, however, that Mr. Jowett has not discussed the question in the present work. We trust he will take some future opportunity of letting us know his reasons—a step which the equally pronounced, but directly contrary, opinion of his "father Parmenides," as he pleasantly styles Mr. Grote, would render peculiarly graceful. Mr. Jowett's scepticism (vol. ii. p. 101) as to Plato's Sicilian relations will, we think, startle scholars. Doubt as to the Platonic authorship of that *Apologia pro vita suâ* commonly called the "Seventh and Eighth Epistles," may be forgiven; though we confess that after some change of opinion we are disposed to believe them genuine. But that they have no historical authority is an opinion, so far as we know, which is peculiar to Mr. Jowett. A critic not too easy to please has said, "Platonis ipsius esse hanc epistolam (*sc.* septimam) et argumentum et stylus clamant, et neminem alium in Græcia novimus qui de his rebus *sic* scribere potuisset." We confess that, as at present advised, we think Gabriel Cobet's the more credible opinion of the two.

Of the other suspected dialogues, the second *Alcibiades* is the most certainly spurious. It contains solecisms of language which even a contemporaneous "falsary" (to use Bentley's term) could not have been guilty of; and there is nothing in the matter or treatment to remove the suspicion hence arising. In the *Hipparchus*, if the text is sound, there are some queer expressions, but its antiquarian lore indicates an Athenian author. The first *Alcibiades*, though a somewhat common-place production, and destitute of Plato's charm of style, has not the same direct notes of spuriousness. The second *Hippias* ought to be taken out of the list of doubtfuls. Aristotle calls it "*the* Hippias"—as he speaks of *the* Phaedrus and *the* Phaedo—and we cannot think that he would have paid it this compliment had he not believed it to be Plato's. Let those who dispute this inference produce a single instance in which he thus cites the work of an inferior writer of dialogues, whether Xenophon, Aeschines Socraticus, or any other. So when he mentions the Antigone and the Electra, he means the *Antigone* and *Electra* of Sophocles, not those of Euripides, which were less famous. His recognition of the *Menexenus*, though under another title, settles the question as regards that work also, which, indeed, we think ought never to have been disputed. The *First Hippias* is not mentioned by Aristotle, but a passage in the Topica has been surmised to refer to it (p. 146, a, Bekker). We almost wish that Mr. Jowett had translated this dialogue, for whether genuine or not, its satire, if broad, is vastly amusing; and besides, it presents one or two ethical questions in a striking light, as for instance the relations of the beautiful, the good, and the useful. After all, the only unanswerable proof of spuriousness is the co-existence of common-place thoughts, or unskilful treatment, with gross violations of Attic usage; and where no such abnormities exist, a wise critic will not at once condemn a dialogue because it seems to him "unworthy of Plato." Mr. Jowett has, we think, shown due caution in dealing with these delicate questions. As a good specimen of his method, we may point to his explanation of certain peculiarities of phrase in the *Laws*, which Zeller has adduced as arguments against the genuineness of a work unhesitatingly accepted by Aristotle.

> "There is no real ground for suspecting their genuineness because several words occur in them which are not found in the other writings of Plato. An imitator will often preserve the usual phraseology of a writer better than he would himself. But, on the other hand, the mere fact that authorities may be quoted in support of most of these uses of words, does not show that the diction is not peculiar. Several of them seem to be poetical or dialectical, and exhibit an attempt to enlarge the limits of Greek prose by the introduction of Homeric and tragic expressions. Most of them do not appear to have retained any hold on the later language of Greece. Like several 'experiments in language' of the writers of the Elizabethan age, they are afterwards lost; and though occasionally found in Plutarch, and imitators of Plato, they have not passed current in Aristotle or the common dialect of Greece."

Professor Jowett's vindication of this great dialogue is perhaps the best specimen of refined apologetic criticism to be found in our language, and it ought to set at rest a question which, had all critics been equally circumspect, would never have been raised at all. We say this without any disposition to underrate the marks of failing power which are but too evident in this product of Plato's old age, its "tautology, obscurity, self-sufficiency, sermonizing, and rhetorical declamation," all of which are strongly felt and clearly set forth by Mr. Jowett. We are glad to find that he recognises the reference to the *Laws* in Isocrates' *Oratio ad Philippum*, which proves that the work was published within two years after Plato's death: if, indeed, it does not invalidate the tradition that it was published posthumously by Philippus of Opus. The very unsatisfactory state of the text in the *Laws* is not noticed by Mr. Jowett, who in his apparent estimate of MS. authority seems to us somewhat too indulgent.

Very striking also is the skill with which he disposes of objections to the genuineness of that subtlest of dialogues the *Parmenides*. This work, it is true, is not one of the comparatively few named by Aristotle; but the coincidence between portions of his critique of the Platonic ideas and that put in the mouth of the Eleatic sage in this dialogue is too close, we think, to have been accidental: and we may

perhaps add this to the somewhat numerous list of cases in which Aristotle's treatment of the philosophers who preceded him may be qualified as more or less consciously unfair.

"Perhaps," says Professor Jowett, "there is no passage in Plato showing greater metaphysical power than that in which he assails his own theory of ideas. The arguments are nearly, if not quite, those of Aristotle; they are the objections which naturally occur to a modern student of philosophy. Many persons will be surprised to find Plato criticising the very conceptions which have been supposed in after ages to be peculiarly characteristic of him. How can he have placed himself so completely without them? How can he have ever persisted in them after seeing the fatal objections which might be urged against them? The consideration of this difficulty has led a recent critic (Ueberweg), who in general accepts the authorised canon of the Platonic writings, to single out the Parmenides as spurious. The accidental want of external evidence, at first sight seems to favour this opinion.

"In answer, it might be sufficient to say that no ancient writing of equal length and excellence is known to be spurious. Nor is the silence of Aristotle to be hastily assumed; there is at least a doubt whether his use of the same arguments does not lead to the inference that he knew the work. And, if the *Parmenides* is spurious, a similar condemnation must be passed on the *Theaetetus* and *Sophist* and, therefore, on the *Politicus* (cp. *Theaet.* 183 E, *Soph.* 217). But the objection is really fanciful, and rests on the assumption that the doctrine of the ideas was held by Plato throughout his life in the same form. Whereas the truth is, that the Platonic ideas were in constant process of growth and transmutation; sometimes veiled in poetry and mythology, then again emerging as abstract ideas, in some passages regarded as absolute and eternal, and in others as relative to the human mind, existing in and derived from external objects as well as transcending them! The *anamnesis* of the ideas is chiefly insisted upon in the mythical portions of the dialogues, and really occupies a very small space in the entire works of Plato. Their transcendental existence is not asserted, and is therefore implicitly denied in the *Republic* and *Philebus;* and they are mentioned in the *Theaetetus*, the *Sophist*, the *Politicus*, and the *Laws*, much as Universals would be spoken of in modern books. Indeed, there are very faint traces of the transcendental doctrine of ideas; that is, of their existence apart from the mind, in any of Plato's writings, with the exception of the *Meno*, the *Phaedrus* and the *Phaedo*. The stereotyped form which Aristotle has given to them is not found in Plato."

We may add in passing that Aristotle, while he states pretty clearly his master's philosophical relation to the Pythagoreans, nowhere alludes to the at least equally potent influence of the Eleatics, whose speculations he examines at great length, but without once comparing them with Plato's.

2. This brings us into the neighbourhood of another problem which has greatly exercised interpreters—the order in which the surviving dialogues were actually written. The discussion of this question has provoked many very pretty quarrels among the countrymen of Schleiermacher, who, as he was the first to propose, was the first also to offer a solution of the entire problem. His daring theory took strong possession of the learned mind of Germany, and was maintained, we believe, to the end of his days by the late venerable and excellent Professor Brandis. This scheme is based, as Mr. Grote says, on the hypothesis "of a preconceived Platonic system with a canonical order of the dialogues adapted to that system," a hypothesis which Mr. Grote has, in our opinion, justly characterised as neither founded on direct evidence nor consistent with the phenomena which the dialogues present. In this opinion Professor Jowett agrees. He "rejects as futile the attempt of Schleiermacher and others to arrange the dialogues into a harmonious whole," "any such arrangement" appearing to him "to involve an anachronism in the history of philosophy." The historical or evolution theory, first advanced by that diligent student of Plato, the late C. F. Hermann, is now in principle very generally accepted by scholars: though, as might have been expected, the greatest difference of opinion prevails as to its application to particular dialogues. The advantage possessed by this principle over that assumed by Schleiermacher is that it provides a natural explanation of the discrepancies, real or seeming, which abound in Plato; and which all the ingenuity of the acute Schleiermacher can for the most part only explain away.

The principle is simply this, that each dialogue, as Mr. Grote puts it, "was generated by the state of Plato's mind at the time it was composed," and that the changes which took place in his views are to be accounted for partly by his personal history, his travels, and other external conditions, and partly by his increasing acquaintance with the speculations of other philosophers. If we add to these agencies the spontaneous development of ideas once planted in a most fertile brain, we seem to exhaust all the possible data. We do not seek to justify the exact order in which Hermann, on these, or rather on the two former of these grounds, would arrange the different dialogues: while on the other hand we do not agree with Mr. Grote that the problem altogether defies solution. We do know, for example, the ultimate form of Plato's convictions on many important questions, especially those of an ethical character. This no one can dispute who holds with Mr. Grote that the *Laws* are a genuine work. On the other hand, setting aside tradition, can we fail to see that dialogues such as the *Lysis*, *Laches*, *Charmides*, and *Protagoras* were composed under the influence of very different ethical ideas from those which animate the *Gorgias*, the *Philebus*, and the *Republic*? Now the teaching in the latter group approximates far more nearly to the teaching in the *Laws* than to that contained in the four former dialogues. They are also more like in spirit and tone, and the changes we observe in their style seem to tend in the same direction. These remarks will we think be recognised as true and even obvious by any Platonic scholar. In the next place, whatever changes Plato's views may have undergone in the course of a prolonged "life in philosophy," there is an *à priori* probability, almost reaching certainty, that such changes would be continuous rather than desultory and irregular. Minds like his "know no harsh transitions:" their very inconsistencies are the result of laws which, to use an Aristotelian phrase, are "knowable in the abstract," if not always "knowable by us."

But though we differ to this extent from Mr. Grote, we by no means ignore the service he has rendered to Platonic criticism by reminding its professors of the delicacy and difficulty of the task which some of them have undertaken in pure gaiety of heart. No previous diasceuast is more free from the charge of levity than Mr. Jowett: none have approached the task in a more modest spirit and with less of preconceived theory. At the same time he is a thoroughly independent enquirer, resolved to use his own eyes and not those of Schleiermacher or Hermann or any other of the numerous scholars and historians of philosophy who have applied themselves to the solution of the same problem. That the question of the order of the Platonic dialogues will henceforth be considered as closed is more than the most sanguine could anticipate; but we think that the book we are reviewing will render new and valuable help to those who really care to trace the mental development of the greatest philosophical genius of his own, perhaps of any age.

One chief merit in our eyes of Mr. Jowett's method is its tentative character. He does not dogmatize, nor think it necessary to seize and hold some conspicuous point of view which he is prepared to make good against all comers. Though on the whole we have come to the conclusion that the order in which the dialogues succeed each other in his book is an approximation, in his opinion, to that in which they were actually written, he nowhere expressly tells us that such is the case. We do not feel justified in assuming that he thinks the *Charmides* earlier than the *Lysis* or *Laches;* but it is clear he wishes us to regard the group, ending with the *Protagoras*, as representing the first stage in Plato's philosophical career. In this opinion, along with perhaps a considerable majority of German critics, we

concur, while at the same time we protest in passing against placing the *Euthydemus* in the same category. In spite of Mr. Grote's arguments, we can see no improbability, but rather the reverse, in supposing that the four dialogues which we have named, and possibly some others of the simpler kind, were written during the lifetime of Socrates. We cannot see why it was more indelicate to introduce the living Socrates in the *Lysis*, than Simmias and Cebes in the *Phaedo;* for one or both were alive when the Thirteenth Epistle was written (if, as Mr. Grote believes, it was written by Plato), and in this the *Phaedo* is distinctly referred to.* The argument that Plato, on his own showing in the Seventh Epistle, was a politician rather than a philosopher during his intercourse with Socrates, seems to prove far too much. In the first place he himself tells us that his resolve to take part in public affairs was coincident with the revolution which ended in the tyranny of the Thirty. That he did take any active part he does not tell us; but only that the treatment experienced by Socrates at the hands of the new rulers disgusted him for the time being with political life. Nor must we forget that his philosophical studies do not date from his first introduction to Socrates. He had previously found time to acquaint himself with the philosophy of Heraclitus, as expounded by Cratylus; and he held through life one of the most important of the Ephesian doctrines. And this consideration apart, who can venture to fix a limit to the productive activity of a youth of Plato's genius, stimulated by a teacher like Socrates? That he had a passion for writing seems to follow from his early attempts in lyrical and dramatic poetry—in which Mr. Grote believes—and even if his friendship with Socrates dates from so late as 407, the eight years between that period and the death of Socrates in 399 would afford ample time for the composition of three or four dialogues on subjects which his διατριβαί with Socrates must have made familiar to him. Mr. Jowett refrains from giving an opinion on this point, though from a passage in his introduction to the *Euthydemus*, we surmise that he sides with Mr. Grote. The anecdote that the *Lysis* was read to Socrates, and that he was displeased, or (as the words attributed to him may very well mean) that he was highly diverted with the liberties his bright young scholar had taken with his name, he would doubtless reject, though for our own part we think it as likely to be true as not; for what motive could have led an inventor to select so comparatively insignificant a dialogue as the *Lysis* when there were others better known in which Plato takes quite as great liberties with his master? However this may be, there is a cheerfulness, a lightheartedness in these firstlings, as we hold them to be, of Plato's genius which we seek in vain among the grander and more sombre products of his riper age, so many of which seem haunted by the shade of his dead master. This consideration, combined with the fact that the dialogues we have named contain no element of doctrine or method which an intelligent pupil of Socrates might not have found expressed or implied in the teaching of his master, inclines us to the belief that they, or at least the three smaller ones, were composed during his lifetime. The *Protagoras* indicates, it is true, a certain discontent with the pure Socratic dogma; and its sceptical conclusion seems to favour the idea that Plato's ethical convictions were even then developing into something more "rich and strange" than the utilitarian rationalism of his master. "If virtue is knowledge then it must be matter of teaching, and the Sophists are in the right; if it cannot be taught, then it is not knowledge, and Socrates must be in the wrong." Such is, or seems to be, the ethical outcome of a dialogue which Mr. Jowett aptly describes as perhaps the last, certainly the greatest of the earlier or purely Socratic works.

The second group in Mr. Jowett's arrangement begins with the *Meno*, and ends with the *Republic* and its supplementary dialogues, embracing also the *Phaedo*, *Symposium*, and *Phaedrus*. All these dialogues—we say nothing of minor works such as the *Apology*, *Euthyphron*, and *Crito*, which are classed, though they have no distinct philosophical connection, with the former—have one feature in common: the "ideas" are in all alike presented in their transcendental as distinguished from their merely logical aspect. Mr. Jowett wisely refrains from fixing the order of this group of dialogues among themselves—though, somewhat oddly, as we think, he ventures to place the *Symposium* before rather than after the *Phaedrus*, and puts the *Cratylus* just before the *Republic*.

Between this second, and his third group, consisting of the *Parmenides*, *Theaetetus*, *Sophist*, and *Statesman*, he intercalates, as transitional dialogues, we may suppose, the *Gorgias* and the *Philebus*. In this, we think, he attributes too much scientific maturity to the *Gorgias*, which appears to us one of the earliest specimens of Plato's second manner, and rather in the nature of a work *d'occasion* than of an integral part of a great philosophic series. That it can have been written after the *Republic* is to us incredible; and perhaps we are misinterpreting Mr. Jowett in inferring such to be his opinion.

On the other hand, his view both of the places of the *Philebus* and of the great dialectical Tetralogy, the *Parmenides*, *Theaetetus*, *Sophist*, and *Statesman*, strikes us as both original and profound. The introductions to these works exhibit a faculty which in a historian of philosophy is of all the most valuable—the faculty of philosophical imagination. It is this in fact which contributes the great charm of Mr. Jowett's work, and which makes ample amends for his, perhaps, too serene indifference to testimony, historical facts, textual criticism, and other such empirical considerations. Mr. Jowett has not only the power, in a remarkable degree, of thinking himself into the mind of his author, but also of expressing with rare truth and delicacy meanings and shades of meaning which escape equally powerful but less subtle thinkers. The most delicate handling is indispensable in the treatment of such questions as the growth of a theory so attractive yet so thin and impalpable as that of the Platonic ideas—that "dream which was not all a dream." What were the steps by which Plato arrived at it? what modifications did it undergo in the mind of its author? how are we to account for those modifications, and for its entire disappearance from the work of his old age?—these are questions which will be found better treated in these volumes, we do not hesitate to say, than in any critique of the Platonic philosophy known to us. The following extracts will make Mr. Jowett's point of view sufficiently intelligible to those who are exercising or have exercised themselves with similar enquiries. In his introduction to the *Philebus* (vol. iii. p. 130) he says:—

> "The omission of the doctrine of recollection, derived from a previous state of existence, is a note of progress in the philosophy of Plato. The transcendental theory of pre-existent ideas, which is chiefly discussed by him in the *Meno*, the *Phaedo*, and the *Phaedrus*, has given way to a psychological one" [in the *Philebus*].

The *Philebus* is also later than the *Republic*, because of—(1) Its "general resemblance to the later dialogues and the *Laws;* (2) The more complete account of the nature of good and pleasure; (3) The distinction between perception,

* We would not, however, be understood to accept the Thirteenth Epistle as genuine ourselves. The reference to the *Phaedo* is surely a note of spuriousness, and too much in that sophistical manner which Bentley is in other instances so quick to detect.

meaning, recollection, and opinion, indicates a great progress in psychology; also between understanding and imagination, described under the figure of the scribe and the painter (p. 39)." "A superficial notion," he thinks, "may arise that Plato probably wrote shorter dialogues, such as the *Philebus*, the *Sophist*, and the *Politicus*, as studies or preparations for longer ones;" but "this view is seen to be fallacious, because," in Mr. Jowett's opinion, "these three dialogues make an advance upon the metaphysical corruptions of the *Republic*. And we can more easily suppose that Plato composed shorter writings after longer ones, than suppose that he lost hold of further points of view which he had once attained." —*Ib.* p. 143.

Those who in spite of the plausible reasonings of Socher and his followers remained true to their critical instincts, and refused in the *Parmenides*, *Sophist*, and *Statesman*, to hear any other voice than the voice of Plato, will probably welcome Mr. Jowett's explanation, as the most satisfactory that has yet been devised, of the instances of apparent disagreement with recognised Platonic doctrine which are found in the dialogues in question. The *Parmenides* contains a searching elenchus of the doctrine of ideas, considered as transcendentals. The "Sophist" not only seems to speak lightly of the εἰδῶν φίλοι (who may be the Megarians), but promulgates a theory of ideas seemingly contradictory to Plato's, and more nearly resembling the Aristotelian view of the εἶδος as an immanent formative principle (*Soph.* pp. 248, 249). Now if this is, as we believe, a deeper form of idealism than that which is usually associated with Plato's name; and if Mr. Jowett is right in finding in the *Sophist* and its continuation, the *Statesman*, a progressive decline in style, and an approximation to the more rhetorical diction of the *Laws*—and so far as the *Statesman* is concerned, we have held this view ourselves—it is at least reasonable to infer that the better thoughts of Plato were also his later thoughts, and that his proverbial "inconstantia" in this as in other departments is to be attributed to the enduring vitality and unresting progressiveness of his mind. Γήρασκεν δ' ἀιεὶ πολλὰ διδασκόμενος.

We cannot now go further into this interesting enquiry, but we may say that, as a whole, Mr. Jowett's grouping of the dialogues seems to us at least as probable as any that has preceded it. We have already indicated dissent in the case of the *Euthydemus* and of the *Gorgias:* we think also that the *Symposium* is more likely to have followed than preceded the *Phaedrus*—indeed we do not know that Professor Jowett would insist on the opposite view. And however we explain the apparent breach of continuity between the *Theaetetus* and *Sophist*, dialogues professing to stand to each other as two succeeding dramas of a Trilogy, we see in the former dialogue no trace whatever of the stylistic decadence which Mr. Jowett detects in the *Sophist*, and which we have admitted to exist in the still admirably well composed *Statesman*. Schleiermacher, it is well known, interpolates three dialogues between the *Theaetetus* and the *Sophist:* and though his choice is, as usual, somewhat crotchety, the instinct which led him to suspect an interval of time in the composition appears to have been a sound one. We think also that the terse and pregnant *Philebus* hardly deserves to be classed with "writings of Plato in which the style begins to alter." If this were true, we should find in it one reason the more for separating its composition by several years from that of the *Gorgias*, a dialogue which to us bears traces of robust youthful vigour rather than of senescence.

W. H. Thompson.

Scientific Notes.

Miscellaneous.

Mr. Herbert Spencer's article on "Morals and Moral Sentiments," in the *Fortnightly Review* of this month, is interesting, though inevitably sketchy. He distinguishes, with timely insistance, "Morals" and "Moral Sentiments"—the ideal regulation of conduct, according to Mr. Spencer's view of Moral Science, and the actual regulation that has historically existed among men. For the former Mr. Spencer has promised us a complete system of demonstrative or rational, as distinct from empirical, utilitarianism: wherein deductions "from the laws of life and the conditions of existence" as to the "kind of actions which *necessarily* tend to produce happiness" will override "direct estimation of happiness or misery." But the chief object of the article is to point out (in reply to some misdirected criticisms of Mr. Hutton) that the moral intuitions of mankind are derived, according to the writer's view, from *unconscious* association of revived pleasurable and painful feelings: not from conscious recognition of relations between these feelings and the acts approved and condemned. The moral sentiments spring from a double root, "ego-altruistic" and "altruistic." The ego-altruistic sentiments are directed towards actions as associated with praise or blame, which are themselves impellent or deterrent from their association with pleasures and pains in general. This latter connection is only strengthened not formed in the individual's experience, being originally inherited in his nervous system. The root of the altruistic sentiments (which are later in development) is sympathy, the natural concomitant of gregariousness, though repressed in low states of society by the needs of self-preservation, and the want of sufficient intelligence to interpret the expression of feelings. These two forms of moral feeling are originally distinct, though they ultimately blend with and support each other, the altruistic feelings tending continually to predominate. But here Mr. Spencer's exposition wants clearness: as he does not recognise the distinction (carefully expounded by Mr. Bain) between the volitional effect of sympathetic pleasures and pain, and the sympathetic impulses to action on behalf of others, out of proportion to the pleasure and pain actually communicated. Only the latter impulses can properly be called altruistic. Some explanation too is wanted of the characteristic property of ethical apprehensions, the recognition of *rule* or *standard*, which is implied in the word approbation. Adam Smith (whose subtle and penetrating work Mr. Spencer notices appreciatively) gave himself some trouble to derive this from the complex operation of sympathy, but his account is not adequate.

An elaborate work on the physiology of vocable sounds is promised by Prof. Donders of Utrecht. He has already brought out a pamphlet on this subject. The kindred question of pronunciation has been taken up by the eminent Semitic philologist, Prof. Land, who recommends the adoption of a phonetic system of spelling. Both works have a primary reference to the Dutch language; they are noticed in the *Gids* for April.

Geography.

An American Arctic Expedition under Captain C. F. Hall, who explored Frobisher Bay in 1862, and subsequently spent five years (1864–69) in the neighbourhood of Repulse Bay, south of Melville Peninsula, and in re-searching the scene of the wreck of Franklin's expedition, is being fitted out, to sail in May, under the direction of the Smithsonian Institution of Washington. Captain Hall will be accompanied by Dr. Emil Bessels, also a practical arctic voyager, known through his interesting observations made in 1869 in the seas between Spitzbergen and Novaia Zemlia.

The preliminary report of a South African journey, made by Edward Mohr in 1869–70, from Natal through the Transvaal Republic and the region of the goldfields of Mosilikatse's kingdom, to the Victoria Falls on the Zambesi, appears in the fifth part of *Petermann's Mittheilungen*. Mohr has sent to Europe a most valuable series of astronomically determined positions on this route; and his journey will prove an important addition to the geological knowledge of South Africa.

An examination of the mean monthly and annual temperature of the British Isles, based on observations extending over a period of thirteen years (1857 to 1869) at 155 stations, has been made by Mr. A. Buchan, the secretary of the Scottish Meteorological Society, and published in a recent number of their *Journal*. This paper affords the first reliable solution of this meteorological problem, which has an important bearing especially on the agricultural interests of the kingdom. The monthly isothermals illustrate the powerful conserving influence of the ocean on the temperature of these islands, and they enjoy that mean annual temperature (45° to 52°) which experience has proved to be most conducive to health and longevity.

Geology.

Discovery of the Remains of a Glutton in England.—In *Nature* for March 30, Mr. T. M'K. Hughes records the discovery of a fossil bone which has been determined by Mr. W. Boyd Dawkins to be that of the glutton. The locality is a cave which has long been known to exist close to Plas Heaton, near St. Asaph. Along with the bone in question (a portion of the jaw), a large number of others have been found, including the remains of reindeer, elk, &c., the animals upon which the glutton principally feeds. The cave is situated on very much higher ground than any of the other bone-bearing caves of the district, and runs down into the hill with the bedding of the rock. Where the other end may be there is as yet no evidence to show, but it promises to be a cave of great extent, and, judging by the festoons of stalactite already arrived at, of great beauty also. Its chief interest, however, lies in the strong probability, from its size and position, that it will contain a very full record of the early natural history of the district.

Shell Heaps in New Brunswick.—It is stated in a recent number of our American contemporary, *Harper's New Monthly*, that a careful search on the shores of Kent and Northumberland Counties, on the eastern coast of New Brunswick, has shown that in consequence of the wearing away of the soft sandstone shale of the coast for many rods, all traces of the shell-deposits, believed to have once existed in abundance, have now entirely vanished. This is the more to be regretted as of late years many discoveries have been made in regard to the habits and characteristics of the aborigines inhabiting the coast of North America before the time of Columbus, by careful examination of the artificial heaps of refuse shells, bones, &c. accumulated in the vicinity of their villages.

An American Bone-cave.—In the *American Journal of Science* for March is a preliminary report, by Prof. E. P. Cope, on one of the most interesting scientific discoveries in America, that of a true bone-cave near Phœnixville, Pennsylvania. The remains hitherto found have been very extensive, for the greater part of extinct animals, and include species of mastodon, horse, and mylodon, and of some animals entirely new to science.

Zoology.

The Crustacea of the Gulf-stream.—The *Bulletin of the Museum of Comparative Zoology at Cambridge* has printed a portion of Dr. Stimpson's report on the brachyurous crabs dredged up by Count Pourtales in the Gulf-stream off the coast of Florida. The total number of Crustacea dredged up is eighty-one species, of forty-seven genera, fifty-two of the species and nineteen of the genera being considered new. Only a small proportion of the species were from great depths, fifteen only being recorded as coming from below 100 fathoms, and none from below 150 fathoms, those from the greatest depth belonging to the family *Portunidæ*.

Geographical Distribution of the Ostrich.—The ostrich has usually been considered as peculiar to the continent of Africa, where two species have been recognised, one belonging to the northern portions, the other to the regions nearer the Cape of Good Hope. These species were long considered identical, and their distinctness was first suggested by the difference in the texture of the egg. In a recent work by Hartlaub and Finsch on the Birds of Eastern Africa, it is shown that either the ostrich of Northern Africa or a third species was known at a very remote period in Central Asia, and perhaps even in India; and that at the present time it occurs wild in Syria, Arabia, and Mesopotamia, where, in fact, it was mentioned by the earliest writers, including Herodotus, Aristotle, and Diodorus.

Physiology.

The Supposed Fungoid Origin of Cholera.—Mr. T. R. Lewis, M.B., Assistant-Surgeon to H.M. British Forces in India, has recently published a report on the microscopic objects found in cholera evacuations, illustrated with engravings of microscopic slides, executed with remarkable beauty and correctness in the office of the Surveyor-General of India. In this report Dr. Lewis has added considerably to our knowledge of some obscure points of microscopical science, while his conclusions are in direct opposition to those of Hallier and Pettenkoffer with regard to the fungoid origin of cholera. His general conclusions may be summed up as follows:—1. That no cysts exist in choleraic discharges which are not found under other conditions. 2. That cysts or "sporangia" of fungi are very rarely found under any circumstances in alvine discharges. 3. That no special fungus has been developed in cholera discharges, the fungus described by Hallier being certainly not confined to such. 4. That there are no animalcular developments, either as to nature or proportionate amount, peculiar to cholera, and that the same organisms may be developed in nitrogenous materials even outside the body. 5. That the supposed *débris* of intestinal epithelium is not of this origin, but appears to result from effused blood plasma.

Structure and Function of the Mucous Glands of the Stomach.—An investigation into this subject has recently been undertaken by M. Ebstein, the subjects of his experiments being principally dogs. The glands in question are chiefly found in the pyloric region, where they replace the true peptic gastric glands. The pyloric region is of a paler tint than the rest of the stomach, and gives an acid reaction to test-paper, though not quite so intense as the other parts. The epithelium lining the interior of the stomach and the pits or alveoli is cylindrical, the cells being usually closed; but sometimes, especially during digestion, burst, the mucous contents then escaping. At their bases are smaller cells which at first resemble lymph corpuscles, but gradually develop into the columnar cells, and are particularly distinct in preparation made with perosmic acid, by which reagent they are less strongly tinted than the ordinary cells. Into the bottom of the alveoli of the pyloric region two, three, or more mucous glands open. These present an orifice, a neck, and a clavate extremity. Their interior is lined by a layer of columnar epithelial cells, the nuclei of which are near their attached extremities. The cells are shorter, darker, and more granular than those of the surface of the stomach generally, and there are no "supply" or secondary cells at their bases. They resemble the cells lining the peptic glands which have been described by Heidenhain under the name of "principal cells" (Hauptzellen) not only in the points mentioned above but in their microchemical reactions and the changes they undergo during digestion. From all this it appears that the statements made in physiological works to the effect that there are two kinds of glands, one destined to supply the gastric juice, the other to yield the mucous fluid of the stomach, are not borne out by the results of microscopic research. It would rather appear that all the glands of the stomach are lined by an epithelium which produces gastric juice, whilst the general surface of the stomach is invested by an epithelium which is capable of producing the mucus. This *résumé* is taken from the 6th number of the *Centralblatt* for 1871.

On the Movements of the Eyes.—It has long been a question whether, when the head is inclined from side to side, any rotation of the eyes in the opposite direction occurs. Donders was unable to demonstrate any such rotation by the application of his mode of "after impressions." M. Javal however, who is subject to astigmatism, has found that, if the astigmatism be accurately corrected by means of cylindrical glasses when the head is erect, the correction is not perfect when the head is inclined, and that the eyes must consequently have altered their position in the head. A repetition of Donders' experiments of obtaining strong "after impressions" by an improved method also showed that some rotation occurs. The experiments showed that with an inclination of 10° of the head the rotation of the eyes amounted to rather more than 1°, and that it increased proportionately to the inclination, so that when this amounted to 70° or 80° the rotation increased to 8°·6, much less therefore than was admitted by Hueck. (See *Centralblatt*, No. 5, 1871, and Skrebitzky in the *Nederland. Archiv. f. genees- en Naturkunde*, Band V. p. 474).

Nerve-endings in the Tadpole's Tail.—A paper on the above subject, by Dr. E. Klein, whose appointment as Assistant-Professor in the new laboratory in connection with the Brown Trust for experimental pathology has just been announced in the *British Medical Journal* and *Nature*, appeared in May, 1870, in the Transactions of the Royal Academy of Sciences of Vienna (*Sitzb. d. K. Akad. d. Wissensch.* Bd. LXI. 1. Abth. Mai-Heft, Jahrg. 1870). This paper has, we believe, not yet been mentioned in English journals, and as it is of considerable interest, we here give a short account of his results. The tadpoles of *Hyla arborea* were found best fitted for examination, owing to the small quantity of pigment in their tails. The tissue was examined both in the fresh state and after treatment with perchloride of gold. Immediately beneath the epithelium lies a close network of extremely fine nerves, the meshes of the network being round or more commonly polygonal. This network, which forms as it were a sheath to the tail immediately beneath the epithelium, is so fine *that two or even four of its meshes can be covered by the nucleus of an epithelial cell.* Interspersed in the plexus are nuclei and multipolar ganglion cells, the processes of which are in continuity with the fibres composing it. Dr. Klein has never observed any connection between the finest nerves and the epithelial cells, though he has very carefully looked for it. On this point therefore he confirms Hensen's views (*Virchow's Archiv*, Bd. 31, p. 51), and with him denies the correctness of Eberth's observations (*Max Schultze's Archiv*, Bd. 2, Heft 5).

Odours and their Action on the Health.—The following remarks appear in a late number of *La Presse médicale belge*. A knowledge of perfumes reaches to the most remote antiquity. The Jews made use of them in the time of Moses. They were highly esteemed by the Greeks in the time of the wise but rigorous Solon. Their use was carried to excess by the Romans; and finally, in our times, they appear to have arrived at their utmost perfection and delicacy. It has been reserved also for the present day to use them in the greatest profusion. But if the perfumes that are everywhere found, and can be extracted by certain processes, may be used with safety, this cannot be said in every case of the odours that are naturally exhaled by flowers, leaves, or

fruits. Their action on the economy in a limited space, and especially during the night in a closed chamber, deserves to be noticed. It manifests itself by serious disorder, headache, syncope, and even by asphyxia if their action is too long prolonged. In nervous persons numbness may occur in all the members, convulsions, and loss of voice, but in general only a state of somnolence, accompanied by feebleness and retardation of the action of the heart. This state is often associated with well marked dimness of vision. Amongst the flowers that are most deleterious may be mentioned the lily, hyacinth, narcissus, crocus, rose, carnation, honeysuckle, jessamine, violet, elder, &c. In addition to the danger caused by their smell should be mentioned their action on the air. During the night flowers actively produce carbonic acid, which is injurious to health. Majendie even cites a case of death caused by a large bouquet of lilies which the sufferer, a previously healthy woman, had slept with in her bedroom. Amongst the more dangerous plants may be mentioned the walnut, the bay-tree, and hemp. The action of these is well known, the latter indeed producing a kind of drunkenness.

The Transverse Striation of Muscle.—In the *Academy* of last year (vol. i. pp. 76 and 156) will be found an account of the structure of striate muscle by M. Hensen and a critique upon his views by M. Krause. In the last part of the *Zeitschrift für Biologie* (Band vi. Heft 4) the latter writer again takes up the subject and maintains that Hensen, under the name of "Median disk," has confused three separate and distinct things. 1. The true transverse lines as seen with accurate focussing in the Invertebrata, but has at the same time confused the anisotropal with the isotropal substance. 2. In the higher Vertebrata, with accurate focussing and oblique illumination, he has mistaken for the true transverse lines the shadow thrown by the border of the anisotropal substance. 3. In the lower Vertebrata, with too high focussing, he has mistaken for them the dark line which is the expression of the high refractive power of the anisotropal substance.

Preservation of the Contractile Gland Cells of the Skin of the Frog.—Dr. T. Engelmann gives the results of his observations on this point in the last part of Pflüger's *Archiv für Physiologie* (Jan. 1871). The glands in question are very numerous, and are distributed over the whole surface of the body of the frog. They are distinctly contractile under nervous excitation, and are composed of a basement membrane with a lining of cells. The cells are arranged in two layers—an external flat and probably contractile layer, and an internal layer of more cubical form. The two layers are not very readily separable from each other. Prof. Engelmann found that momentary mechanic or electric excitation of the distal extremity of the divided sciatic nerve causes temporary contraction of all the glands of the hind feet. The contraction attained its maximum in from half a second to five seconds. If the shocks be repeated with sufficient frequency, the glands, or rather the gland cells, appear to pass into a state of tetanus, and they then assume a cloudy appearance. Independently of direct excitation, the contraction of the gland cells may be called into play reflectorially as by irritation of the nerves of various parts of the body. The reflex irritation is conducted centripetally through the posterior, centrifugally through the anterior roots of the spinal cord. The contractions entirely cease after complete destruction of the brain and spinal cord. The activity of the motor nerves is not abolished by woorara.

On the Reproduction of the Epithelium of the Cornea.—Stricker's *Medizinische Jahrbücher*, 1871, Heft 1, mention some observations, made by Dr. Hjalmar Heiberg, of Christiania, on the cornea of the frog, common fowl, and rat. The epithelium was scratched off clean with a scalpel from a small space on the surface of the cornea, and a series of corneæ so prepared was observed after intervals of five, six, eighteen, forty, &c. hours. Immediately after the operation the free space is bounded by sharp vertical edges. In five or six hours the edges become flattened, so that the boundary line is no longer well defined. After a lapse of eighteen hours the space is reduced in size by one-half. In from forty hours to three days the space is entirely covered over. So far for naked eye appearances. With the microscope it was found that the epithelium was only reproduced round the edges of the space; an insulated spot of epithelium never appeared. When this occurs in the case of reproduction of common skin over abraded surfaces, Dr. Heiberg believes that the parent epithelium of the spot is derived from some undestroyed gland-duct. As there are no glands in the cornea the phenomenon cannot occur here. Some of the corneæ were watched for from two to five hours under the microscope in blood serum. Wander cells were observed on the free surface of the cornea in its substance and also among the epithelial cells, but Dr. Heiberg was unable to observe the transmutation of these cells into epithelial cells. Between the mass of old cells and the two or three rows of new ones was seen a zone of yellowish masses, apparently of intercellular albuminous substance. These masses appeared to have always a centre of aggregation. They executed amœboid movements, and one of them was observed to separate into five rounded masses. Dr. Heiberg's conclusions were, however, principally drawn from the investigations of sections of the corneæ treated with perchloride of gold. Apparently two layers of cells advance over the denuded space; the cells of the outermost layer sometimes advancing over those of the undermost and sometimes *vice versâ*. Cells with many nuclei are of rare occurrence, but do nevertheless present themselves. One was observed containing five. Dr. Heiberg believes that the cells round the edge of the bare space send out processes in which there appears a translucent spot. The process becomes constricted off and forms a new cell, the spot becoming its nucleus. He thus thinks it probable that the nuclei of the new cells are not derived from the division of those of the parent cells. These new cells then become the parents of others in the same manner, and thus the space is covered up. The results of these observations are directly opposed to those of J. Arnold, who holds that the new cells are developed out of a finely granular mass, which he says at first coats over the abraded surface.

Botany.

Fertilisation in Proteaceæ.—Mr. G. Bentham has been recently investigating this subject, and made it the subject of a paper read before the Linnean Society on April 6. In plants belonging to this Australian order, the anthers mostly discharge their pollen before the expansion of the flower, as is also the case in Compositæ. In this latter order self-fertilisation is prevented by the fact that the stigma remains hermetically closed until after the opening of the flower. In Proteaceæ, on the other hand, the style is undivided, and the stigmatic surface is exposed even in the bud; and the contrivances for screening it from the action of the pollen of its own flower are very various. The anthers generally form, as in Compositæ, a closed tube surrounding the stigma, which is, however, generally immature at the time of the extrusion of the pollen. That self-fertilisation seldom takes place is shown by the fact that in no genus is the style more completely smothered with pollen than in *Grevillea*, while there is none in which fecundated fruit is rarer. In one section the style completely turns away from the anthers while they are discharging their pollen, and becomes buried in a pouch prepared to receive it; while in another the stigma always faces the upper anther, which alone is abortive. In one genus the style is bifurcate, as in Laurineæ, and some authors suppose the ovary to be bi-carpellary, as is the case in Compositæ; but the author has come to the conclusion that this is not the case.

Chemistry and Physics.

On the Effects of Cold upon the Strength of Iron.—In a paper read before the Manchester Literary and Philosophical Society, Mr. W. Brockbank details a number of experiments made with bar-iron, boiler-plates, wire-billets, and rails, which seem to give an opposite result to those of Fairbairn, Joule, and Spence, an account of which appears in the *Academy* for Feb. 15, p. 141. He maintains that these are all materially weakened by the action of intense cold, losing their toughness, the structure being changed from fibrous to crystalline. In one series of experiments, for instance, in which iron bars 1 in. square, made from a mixture of 4 pig-irons of the highest class, added to some good scrap-iron, were tested by a powerful lever machine, the breaking-weight required at a temperature of 15° F. was 780 lbs., whereas at 35° it was 844 lbs., at 52° 859 lbs., and at 70° 893 lbs. Again, ten rails were taken promiscuously from a lot of 1000 and tested by means of a falling weight of 2000 lbs., the centres of support being 3 ft. 6 in. apart: 4 were heated to 120° F. and each withstood two 5-foot and one 7-foot blow. The others were tested at 26° F., only one stood two 5-foot blows, three broke at the second 5-foot blow, and one at the first 5-foot blow. It was further found that a true result could not be obtained either by torsion or the direct application of weights, the bar almost immediately became heated, and the effects of cold disappeared; it was only by the method of sudden impact that the influence of temperature on the strength of the material could be ascertained.

On some Properties of Galvanically Deposited Iron.—M. Leng has found that iron deposited from a solution by means of a galvanic current has the property of occluding under certain circumstances considerable quantities of gas, consisting chiefly of hydrogen with small amounts of nitrogen, carbonic oxide, and carbonic acid, and that this property is also shared by copper electrically deposited. He further finds that, when the iron is thrown down on the surface of a plate, the layer first formed occludes by far the largest proportion of gas, the volume of gas absorbed decreasing rapidly as the thickness of the deposit increases. The volume absorbed varies within very wide limits.

On the Theory of Flame.—In the number of Kolbe's *Journal für praktische Chemie* for June 1870 is a short account of some experiments by H. Karl Knapp, which seem to show that the explanations usually given of the non-luminosity of the flame of a Bunsen's burner, viz. that it is a consequence of the perfect combustion of the coal gas, is not the cause, or at least not the only one, of this phenomenon. H. Knapp finds that, if instead of allowing air to mix with the coal gas, a sufficiently strong stream of nitrogen, hydrochloric acid, or carbonic acid gas, neither of which can act as a supporter of combustion, be passed into the flame, the latter becomes perfectly non-luminous. Probably this is in great part due to the reduction of temperature and pressure in the flame consequent on the introduction of the above gases.

On the Spheroidal State of Liquids.—In the well known experiment of Leidenfrost it may be supposed that the drop of water assumes the spheroidal state when the tension of the steam formed at its under surface is sufficient to support the pressure of the atmosphere plus the weight of the drop itself, and that, therefore, if the pressure be removed, a lower temperature must suffice to cause the phenomenon. E. Budde has proved this experimentally by means of the following apparatus: a glass bell jar was cemented on a copper dish standing in a water-bath; the bell was connected with an air-pump and exhausted, and by means of a simple arrangement described a drop of water brought on to the plate. The author found that when the pressure was reduced two-thirds more, the drop assumed the spheroidal state at a temperature of 83° C. The paper concludes with an explanation of the various star-like forms usually exhibited by the drop. (*Pogg. Ann.* cxlii. 158.)

On Cooling and Conduction of Heat in Gases.—Newton enunciated the law in reference to the cooling or heating of a body: that the quantity of heat lost or gained in a second is proportional to the difference between its temperature and that of the surrounding medium. A large number of experiments made by Dulong and Petit seemed to show that this law was not so general as Newton supposed, and their results were afterwards confirmed and extended by De la Provostaye and Desains. In all these experiments the heated body was allowed to cool in a copper or brass chamber, the inner surface of which was coated with lampblack. By a series of careful experiments, F. Narr has found Regnault's observation confirmed, that it is almost impossible to render such blackened surfaces absolutely dry. Dulong and Petit's results being, therefore, open to objection on this score, as well as on others, he has executed a fresh series of experiments by means of an entirely different method, and has arrived at the following conclusions:—That the mathematical expression deduced by Dulong and Petit does not represent the true law of alteration in the rapidity of cooling with the temperature; that the cooling effect of various gases is very different, and that they do not arrange themselves in the order of their chemical, but in the order of their physical behaviour, hydrogen and carbonic acid forming the extremes, whilst nitrogen and air possess almost identical rates of cooling; that the deviations from Newton's law are inconsiderable, and that this law is *probably* the true expression of the cooling effect of radiation. The author further calls attention to the remarkable relation in the behaviour of the various gases to Newton's and Mariotte and Gay-Lussac's law, for whilst hydrogen shows the least, carbonic acid shows the greatest deviation from both laws, air and nitrogen taking up a mean position. He entirely repudiates the idea that the anomalous behaviour of hydrogen is a consequence of its analogy with the metals.

Philology.

THE PRONUNCIATION OF LATIN.

IV.

There are two questions which should be kept quite distinct, but have been much confused in the present enquiry:

I. What is the most convenient method of pronouncing the classical languages?

II. What was the ancient pronunciation?

I. The classical languages being the universal languages of literature, taught in all upper schools throughout the civilised world, it is certainly most convenient to have one pronunciation in every place where they are used, and that that pronunciation should be generally easy to acquire. The only places that can aspire to set the rule are Rome and Constantinople or Athens, where a traditional pronunciation of at least a thousand years old, certainly descended from the ancient, although certainly different from the ancient, prevails for derived forms, and in the ecclesiastical use of the ancient forms. Such slight deviations as would not render pronunciation unintelligible, but would make it easier to particular nations, might be allowed. For instance, an Englishman might pronounce his short vowels as in *pit, pet, pat, pot, to put*, although everyone of them is somewhat different from the Italian sound. Also, as in Rome and Greece, the sound of *h* is unknown, and no notion of quantity exists—vowels being made short or long at pleasure, although the position of the stress is determined in Latin by the rule of penultimate quantity, and in Greek by a written accent which originally depended mainly on ultimate quantity,—we should not cease to be intelligible, and we should improve our reading of versification by sounding *h* and regarding quantity, without altering the position of stress. A little practice would render this easy.

II. Such a system would be avowedly not a restoration of the old, and as we are not now in a position, and probably never may be in a position, to determine the old, it seems better to adopt a uniform plan, thoroughly acknowledged in the classical homes, than to adopt a theoretical pronunciation, which may be as false as that which Erasmus, Smith, and Cheke introduced into England for the Greek language. But the enquiry into the ancient pronunciation is extremely interesting, and it is very desirable that means should be furnished for arriving readily at a knowledge of everything bearing upon it. The means required are:—

1. The publication in ordinary lower-case letters, with divided words, and expanded contractions (indicated by italics), of all old inscriptions, or rather such parts of them as contain varieties of orthography, with strict indications of date and place.

2. A similar arrangement of extracts from the oldest known MSS., and especially of any which give Latin in Greek characters and conversely (as in the instances cited in my *Early English Pronunciation*, pp. 519 and 527).

3. A *catena* of all the passages from ancient authors and later grammarians bearing upon pronunciation, especially of imitative sounds and puns, and, in case of grammarians, of such subsidiary passages as serve in any way to explain the meaning of the terms employed, and the notions of phonetics entertained by the authors.

4. In order to judge of the preceding, a great increase of phonetic knowledge.

Allow me to enlarge a little on this last point, with especial reference to Prof. R. Ellis's remarks on the Latin *v*, in your last number, p. 208. The amount of phonetic knowledge possessed by the greater number of those who are ready to settle the question of classical pronunciation offhand, or at any rate do not hesitate to give a very decided opinion on the subject, is generally woefully small. Even those who have best studied the subject, such as Lepsius, Max Müller, Brücke, Merkel, Melville Bell, have at most but an incomplete and fragmentary amount of knowledge to draw upon. The anatomy of the vocal organs has been pretty well ascertained. The nature of vowels has been also divined by Wheatstone and established by Helmholtz. The difference between vowels and consonants is almost understood. The variety of vowel sounds and of consonant modifications has been to a great extent ascertained, but not nearly to the extent asserted. For example, the notion that all existent varieties are known, or that all possible varieties could be *à priori* enumerated, must be exploded. Sounds exist in such home languages as the Basque which have not been satisfactorily analyzed. Nay, every cultivated language in Europe presents some marked peculiarity which is not thoroughly understood. If we add the peasant dialects (which are phonetically and linguistically of extreme importance) the unconquered difficulties enormously increase. Our philologists have been mainly concerned with *letters*, to the enforced neglect of the living sounds alphabetic signs inadequately infer, rather than represent.

But leaving these general considerations of elementary sounds, of which our knowledge is least incomplete, we know almost nothing of the mode in which different nations feel the combinations of these elements into those extraordinary masses of articulate significant sounds which they utter so glibly. The action of vowel on vowel, of consonant on consonant, of vowel on consonant and conversely, of general syllabication, of the hierarchy of syllables in a word as indicated by accent, stress, quantity, voice-inflexion,

pitch, emphasis, intonation, glide, hiatus, catch, and so on, whereon depend the whole force and meaning of words, and, combined with powers of appreciation and imitation, all the habits of change and interchange of sounds,—the very foundation of philology, without which a proper conception of the descriptions of sound given by men of different nationalities and ages cannot be formed,—all this, the main ingredient in the problem of restoring classical pronunciation,—is as good as utterly unknown, so small, so confused, so ill understood, is the very little knowledge of it which we possess. It is a point on which I speak feelingly, because my own ignorance has constantly stood in my way in the cognate researches with which I have been so many years engaged.

And now to take up the question of Latin *v*, on which Prof. R. Ellis has given us so much valuable information. There is a series of sounds which, for convenience, may be written *p b*, *p,h b,h*, *f' v'*, *f v*, *wh w*, *,wh ,w*. Of these *p b* are readily discriminated by English, French, and Italian. In Upper Germany, and among many tribes of North American Indians, the greatest difficulty is experienced in hearing any difference between them, and certainly in Saxony at the present day, the initial value of either *weiches b* or *hartes p* (for without these adjuncts they cannot tell which letter is meant) is an intermediate sound, which may be written °*b*, and apparently consists of *b* with that peculiar *voix voilée* which enables us to distinguish *b* from *p* when whispering, instead of the usual addition of voice. Throughout Germany final *b* is professedly not distinguished from *p*. Between two vowels, in great part of Middle and Southern Germany, *b* becomes *v'* that is, *v* in which the lower lip does *not* touch the teeth; this is also prevalent in Pennsylvania German. This *v'* is the true sound of German *w* throughout the same districts, but in Northern Germany it is professedly *v*, the denti-labial, not the pure labial. Yet careful observers will find that most Germans can be distinguished when speaking English, by their inability to pronounce pure *v* or pure *w*, and their use of the much easier *v'*. To this *v'* corresponds the voiceless hiss *f'*, in which the teeth have no part, as they have in *f*. The difficulty experienced by Upper Germans, from whom the High German of literature is derived, in distinguishing *p b*, *t d*, is probably very old. They are still inclined to post-aspirate *p* into *p,h*, and this sound probably first generated *pf'*, whence arose the modern High German initial *pf*. Similarly the effort to distinguish *t* produced *t,h*, and the modern *ts*, written *z*. The *k* has remained in the form *k,h*. The post-aspirated *b,h* is not known in Germany, but is familiar to us from the Irish brogue, and is common of course in India.

Now for *v'* the tongue is flat, or actionless. But for *w* it is raised into the position it assumes for *oo* (the English values of vowels are purposely chosen), that is nearly into the position of *k* or *'k*, the latter being the Hebrew ק and Arabic ق, which are usually assumed to have been the original sound of Latin *q*. The contact for *'k* is however much more inward than for *k*, and produces a thickening or obscuration of the following vowel, very similar to that resulting from rounding the lips. Hence, perhaps, when *'k* was lost in Latin, its effect was imitated by *kw'*, that is a *k* spoken with rounded lips, or a *simultaneous k + w*, the present English *qu*, and perhaps Latin *qu*; although it must always remain doubtful whether *kw'* or *gw'* be the correct ancient form. In German, where *w* with the back of the tongue raised is unknown, we may hear *kv'*, a sequence, not a simultaneity. The English *w* is there confused with the vowel *oo*, and the true nature of its voiceless form *wh* misunderstood. But *wh* is related to a labialised form of *kh*, which may be written *kwh*, and is common in Scotland. In Welsh *chw* is written for the same sound, which is not *kh + w*, and is pure in North Wales, while *wh* replaces it in South Wales. Precisely the same thing has happened in English, where *kh* labialised through the action of a preceding labial vowel has passed through *kwh* into *wh*, and thence, through *f'* perhaps, into the familiar modern *f*, in such words a *laugh, trough, dwarf, draft.*

For *,w* the tongue is raised, not into the *oo*, but into the *ee* position, so that *,w* bears the same relation to *ue* (German; French *u*) as *w* does to *oo*. As *w* is related to *k*, *'k*, so is *,w* to *ky'*, *k'*, of which *ky'* is that palatalised *k* spoken of by Prof. Max Müller (*Academy*, Feb. 15), common still in old-fashioned English, in Icelandic, in French, and even Italian, and *k'* is a peculiar Picard form of the same, approaching to *ch'*, the true monophongal Roman sound of the Tuscan *c*, slightly differing from our own diphthongal *ch* in *cheese.* The *,w* form is not acknowledged, but it is developed in the French diphthong *ui*; thus *puis* is generally *p,wee.* The audible effect is much more like *v'* than like *w*. This consonant was probably developed from the Greek diphthongs *αυ*, *ευ*, with true *ue*, not *oo*, and then the *,w* passed, before voiceless consonants, into *,wh*, whence the modern Greek form of *αυ*, *ευ* with *v'* or *v* before vowels and voiced consonants, and *f'* or *f* before voiceless consonants. Special observations on modern Greek pronunciation lead me to think that *φ β* should be assumed as intentionally *f' v'*, but that every degree of transitional state between these sounds and full *f v* exist, owing to the more or less pressure of the lower lip on the upper teeth (see *E. E. P.* p. 518, with the note on the digamma; also p. 549 for the corresponding Icelandic usage).

These considerations (which might be easily extended) serve to show the difficulty of deciding with certainty on the Latin sound of *v*. All the facts deduced by Prof. R. Ellis are reconcilable with the pronunciation *v'*, and not with *w*, and others are adduced in *E. E. P.* p. 513 *à propos* of the Anglo-Saxon letter which was probably *w*. The interchange of *u* and *v* is not more striking than the constant change of ज ज़ into व in Sanscrit, and yet the Sanscrit grammarians, as Prof. Goldstücker informs me, persist in calling व a *denti*-labial, that is, *v*, and neither *v'* nor *w*. Latin *f* was probably *f*. There is nothing anomalous in a language pairing *f*, *v'* in place of *f'*, *v'* or *f*, *v*, for we find the pair *f*, *v'*, both in German and Spanish. In that case the Greek *φ* in Cicero's time was not *f*, but whether it was *p,h* or *f'* is hard to say; perhaps the latter. If the lost digamma were *f*, this would be another reason why a Greek at that time could not say *f*.

This slight disquisition is sufficient to show how premature any *ex cathedrâ* enunciation of opinion, and how much more premature the introduction of any hypothetical pronunciation into schools must be considered. In arriving at a notion of the old pronunciation, we have to bear in mind, not only the dicta of old grammarians (mostly grossly ignorant of the very elements of phonetics), but the relations of ancient to modern sounds in chronological and geographical sequence. The ancient are as it were the protoplasm of the modern, and we must beware of attributing to the former a status out of which an examination of existing phonetic transitions and relations show that the development of the latter is, to say the least, improbable. This final consideration has been so strongly forced upon me during my researches on Early English pronunciation that I have found it advisable to institute an examination of existing varieties of English pronunciation, in which so much co-operation is necessary that I hope I may be allowed to say in conclusion that I should

be much obliged to any reader who would write to me as below for my tract in explanation of what is required.

25, *Argyll Road, Kensington, W.* Alexander J. Ellis.

Leabhar na h-Uidhri: a Collection of Pieces in Prose and Verse, in the Irish Language; compiled and transcribed about A.D. 1100, by Moelmuiri Mac Ceilechair: now for the first time published from the original in the Library of the Royal Irish Academy; with an Account of the MS., a description of its contents, and an Index. Dublin: Royal Irish Academy House, 1870.

The Council of the Royal Irish Academy have acted wisely in determining to publish authentic transcripts of the more ancient Irish MSS. in their collection, before they become illegible from age and decay. But these transcripts would be much more useful to scholars in general if accompanied by good translations. The present work is merely a lithograph copy, printed from a transcript of the original, admirably executed by the skilful hand of Mr. O'Longan, who has carefully reproduced the characteristic features of the handwriting in the ancient MS., and the forms of abbreviation in which it abounds. Nevertheless, it is very questionable, notwithstanding its accuracy, if it will prove of much practical utility to more than four living scholars out of Ireland. The four scholars here excepted, to whom the publication of *Leabhar na h-Uidhri* will be a welcome boon, are Dr. Whitley Stokes, M. Adolphe Pictet, Herr Ebel, and Chevalier Nigra. In issuing the text in its present form, without a translation, the Council of the Royal Irish Academy, no doubt unintentionally, seem to lend a tacit approval to the idea entertained by some, that the archaic character of the language of the original presents insurmountable difficulties to the mere native Irish scholar. But this idea is without foundation. Large selections from *Leabhar na h-Uidhri* have been already published and translated by scholars now deceased, as well as by others happily still living; and the purity of its ancient text, which entitles it to be regarded as the most valuable Middle-Irish monument now remaining, renders the translation of its general contents a matter of little practical difficulty to any Irish scholar of more than average capacity.

The work is described in the preface as "the oldest volume now known entirely in the Irish language;" but this is at least doubtful. There is in the Bodleian Library an Irish MS. classed "Rawlinson, 502," which the late Dr. Todd, a good authority on the subject, considered to have been written about the year 1100. And his opinion is supported by the internal evidence of the MS., which contains a pedigree, written during the lifetime of a man who died in 1113.

The contents of *Leabhar na h-Uidhri* are of a mixed character, the principal part, however, consisting of mythological tracts of great value to the student of comparative mythology. It comprises also a few historical pieces, including an Irish version of the *Historia Britonum* of Nennius, made by an Irish writer who died in the year 1072.

The tract of greatest importance to the philologist is the very ancient elegy, or eulogy, of Colum Cille (*amra Coluim Cille*), composed not later than the seventh century, which preserves some of the oldest forms now extant of the Irish language. This tract is at present in course of publication from the original by Mr. Crowe, who has already edited some other pieces from the same MS.

The general scholar, however, if furnished with the translation that he had a right to expect, would find more interest in the remarkable romance called the *Tain bo Cuailnge*, a fragment of which occupies fourteen folios of *Leabhar na h-Uidhri*. Fortunately for the investigator of ancient Celtic mythology, of which it is unquestionably the oldest and most important repertory now in existence, a full copy of the tale is contained in the *Book of Leinster*, a MS. written towards the end of the twelfth century. The text is not so pure, however, as that now produced. With this remarkable prose epic (the publication of which would elevate the character of ancient Celtic manners and civilisation) is connected the title of the MS. The story of this connection, which forms the subject of Dr. Samuel Ferguson's fine poem, the "*Tain Quest*" (*Lays of the Western Gael*, 1865), is related in O'Curry's *Lectures, &c.* (pp. 29, 30). Briefly told, it is as follows:—The history of the *Tain* (or Cattle-spoil), which took place in the first century, being altogether lost in the sixth, Murghen, the son of Senchan Torpest, chief poet of Ireland, went to the grave of Fergus MacRoy, one of the principal characters in the *Tain*, sang a lay to his tomb, and raised his spirit, which dictated the whole tale from beginning to end. St. Ciaran of Clonmacnois wrote down the tale in a book made of the skin of his pet cow, which was called the Odhar, or "dark-grey," from her colour; and though this old book has disappeared, the name of *Leabhar na h-Uidhri*, or the "Book of the dark-grey [cow]," is attached to the present MS., out of the belief that it preserves much of the contents of the old book.

The present publication, as already remarked, is very well executed; but the attentive critic will find, nevertheless, some mistakes. These mistakes are not numerous, however; and it is but fair to say that Mr. O'Longan, the transcriber, and his colleague, Mr. O'Looney, have recovered many obscure words, which they might well be excused for failing to detect. The word *todgarach* which appears between lines 21 and 22, p. 11, is wrong. The *t* should not be marked with an aspirate sign, and the abbreviation for *n* should appear over the letter *o*, to represent the word *tondgarach*, which the glossarist intended. The words *nar necustos* (p. 37, col. 2) should be *nar necmuis*, and the name abbreviated *Ag.* in p. 67, col. 1 (last line but one) should represent *Lug.* for *Lugaid*, although a misplacement of a fractured piece of the original MS. may have doubtless caused the error here. It would have been desirable, also, that some notice should have been taken of inaccuracies in the original MS., such as the omission of signs of abbreviation, which are inconveniently frequent, and orthographical errors calculated to mislead the uninitiated. The loss of the contents of col. 1, p. 125, and col. 2, p. 126, as well as col. 1, p. 131, and col. 2, p. 132, should also be indicated in the Table of Defects in the appendix; in which, it may be added, there are some errors requiring correction. W. M. Hennessy.

Intelligence.

Professor Grassmann of Stettin has just finished writing a dictionary and grammar of the Vedic language.

Dr. Corssen is at present in Italy, where he intends to remain five years, in order to study the inscriptions and monuments of Etruria.

THE ACADEMY.

"Inter silvas Academi quærere verum."

Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance.
The Editor of The Academy *cannot undertake to return communications which are not asked for.*
The next number will be published on Monday, May 15, and advertisements should be sent in by May 10.

Subscribers to THE ACADEMY who find it difficult to receive the numbers regularly through the newsagents may secure their regular delivery on the day of publication, post-free, by order to the publishers, at 12s. per annum, or 6s. for 6 months, payable in advance.

General Literature.

Impressions of Greece. By the Right Hon. Sir Thomas Wyse, K.C.B., &c., with an Introduction by his Niece, Miss Wyse; and Letters from Greece to Friends at Home, by Arthur Penrhyn Stanley, Dean of Westminster. London: Hurst and Blackett. 1871.

On one occasion, when a person who had journeyed in the East was introduced to the late Joseph Wolff, the veteran traveller exclaimed, without further preface than a wave of the hand, "I hope he has seen MAN." The suggestion contained in this remark is peculiarly applicable to travellers in Greece. In consequence of the beauty of the scenery and the absorbing interest of the historical associations, they have too often been disposed to regard the present inhabitants either as ideal representatives of the Hellenes, or as a race of unreclaimable knaves, without inquiring into their real character and the circumstances of the country. It is the merit of Sir T. Wyse's books of travel in Greece that this part of the subject receives its fair share of consideration; and in this respect the present volume has an advantage over his former work, the *Excursion to Peloponnesus*, because the comparative absence of important ruins in North Greece enables him to give more space to what is modern, instead of entering into minute details of topography, which add nothing to the information we already possess. It contains an account of three journeys—the first in Bœotia, including some romantic wanderings among the glens and peaks of Helicon; the second in Eubœa; the third through Bœotia to Parnassus. In the middle of the third excursion Sir T. Wyse's narrative breaks off, and the rest of the account is given in letters by Dean Stanley, one of his companions on that occasion, which conclude the volume. It would be ungracious to institute a comparison between the styles of the two contributors; but we cannot help noticing, in passing, the contrast they present to one another: the one writing as a cultivated English gentleman, who describes the scenery and antiquities with the taste of an amateur artist and archæologist; the other as a scholar and thinker, whose remarks are drawn from a wide circle of ideas, and who by the force of his imagination can invest the past with reality. Many travellers visit the sites of Thebes, Haliartus, and Delphi; but it is not every one who could remark, that when following Pausanias's description of the buildings and sights of Thebes, "you feel that you are following an invisible guide—a ghost among ghosts;" or of Haliartus, which, Pausanias says, had temples without roofs and without images, so that he could not make out even to whom the altars were dedicated, that "it must have been a primitive puritan place;" or that "there is this awful feeling at Delphi beyond any other place that I have seen, that you are standing on the grave of an extinct religion." In writing on Greece, Dean Stanley is only returning to a subject of deep interest to him in former years, as is shown, among other places, in his delightful essay on "Greek Topography," in the first volume of the *Classical Museum*.

On the politics and social prospects of Greece Sir Thomas Wyse was eminently qualified to express an opinion, from his long residence in the country as British Minister; and the account he has given in this volume is truly lamentable. The land scantily cultivated, the agriculture bad, the rural population powerless to help themselves, the Ministry at Athens, to whom all look to initiate improvements, indifferent to all interests except their own personal advancement, and jealous of such foreigners as might lend a helping hand—this is the picture presented to us. The system of taxation, in particular, is represented as hopelessly bad. "The treasury is a sort of Genghis Khan. It encamps and levies contributions, as if on ground which it conquered yesterday, and will leave to-morrow. It comes with no lack of exactions, all heavy, all complicated, all unfair; not made to enrich the treasury, but to impoverish the people; and a host of officers, who combine, and leave the people poor and the Government hungry." In Miss Wyse's interesting preface the origin of this deplorable state of things is with good reason referred to the demoralizing influence of the first rulers, Otho and Amalia, at the time of whose arrival the institutions of the country were yet young, and the national character, which with all its faults contains numerous fine qualities, was capable of being moulded into a very different type from what it now presents. They, by sanctioning, or at least permitting, corruption throughout the length and breadth of the land, and by encouraging men of the blackest reputation, and persecuting the honest and straightforward, in order to centralize all the power into their own hands, rapidly lowered and debased the whole people. To the evils already mentioned must be added the now only too notorious one of brigandage. The preface gives an account of the causes of this, and rightly distinguishes between the Klephts under the Turkish rule, who were in some ways the assertors of the rights of the defenceless, and the modern brigands, who are the terror of the rural population. The antagonism which is felt toward them is frequently illustrated in Sir Thomas Wyse's journals; and the responsibility for the existence of these bands is shown to rest upon the Government, because the periods at which they have principally infested the country have been those following the raids into Thessaly in 1854 and Crete in 1868, on both which occasions the prisons were thrown open by the authorities, and criminals of the worst class sent forth to swell the ranks of the invaders. The natural result was that at the conclusion of those luckless expeditions the country was filled with abandoned characters, who had no honest means of subsistence, and to whom the life of a brigand was in every way attractive. The name of the captain of one of these bands, Daveli, occurs over and over again in these pages, especially in the neighbourhood of Helicon, the recesses of which were his favourite haunts; and the story of his death, which occurred close to the spot where Œdipus killed Laius, is given by Dean Stanley, together with a spirited translation of a Greek ballad on the subject, which originally appeared in *Fraser's Magazine*. This, which is an excellent specimen of the Romaic songs, was recited at Arachova on Parnassus, by the village chorus, in honour of Sir Thomas Wyse and his fellow travellers, and describes how the guards of that place, with the help of the inhabitants of the neighbouring villages, surrounded and destroyed the brigands. The sudden transitions which occur in this poem, and the introduction of the birds as a sort of chorus, are very characteristic features of this class of ballads.

To notice a few of the more interesting points which are illustrated in this volume:—in connection with the great earthquake at Thebes in 1853 the frequency of these occurrences in Greece is mentioned, some violent movement occurring at least every second or third year in some portion of the country: this accounts in great measure for the disappearance of temples and other public buildings since classical times. In visiting the local schools, to which Sir T. Wyse paid especial attention, he remarks that, while many subjects are learnt very superficially, language and grammar are everywhere carefully studied. "The children, as well as masters, delight in grammatical victories, and pursue their verbs through all their ramifications with keenness and pleasure." It is this traditional fondness for the study of language which has caused the general uniformity of the Romaic tongue over so wide an area with little help from literature; and it is well worthy of the consideration of those who care for the dialects and idioms of the modern language that these are being rapidly driven out by the Neo-Hellenic of Athens, in consequence of the rapidity with which this is acquired by the people, and are liable to become extinct if they are not soon collected and compared. The reasons of the disappearance of trees in Greece, which has prevailed for centuries and still continues, are here very clearly given. These are, the improvidence of the proprietors, who hire out the cutting for very small sums; the incursions of herds of goats, which destroy the shoots and young trees; the burning of the forests, either by accident or intentionally, by the shepherds, for the sake of the luxuriant grass that springs up after such conflagrations; the hacking of the pine-trees for the sake of the turpentine, which is used for mixing with the wine; and, lastly, the ravages of the charcoal burners. With all these destructive agencies constantly at work the wonder is, not that the trees are disappearing, but that any still remain.

In conclusion, we should mention that we have searched in vain for the dates of the years in which these tours were made—an omission of some importance where the political and social state of the country is being treated of; but we can recommend this volume as pleasant and instructive reading.

H. F. Tozer.

LITERARY NOTES.

Most of the famous conquests of the Spaniards in South America were not only recorded in chronicles, but also furnished subjects for epic poems. The best known is the *Araucana* of the soldier-poet Alonzo de Ercilla; but the conquest of Peru is the theme of Peralta's *Lima Fondada*, the discoverers of the river Plate are celebrated in the *Argentina*, and the valorous deeds of the first explorers of New Granada are sung in the *Elegias* of Juan de Castellanos. In the last number of the *Revista de España* there is a very interesting essay on the latter work by Señor Vergara, who has made several discoveries respecting the personal history of the author of the *Elegias*, concerning whom scarcely anything was previously known. Castellanos had been a soldier, and ended his days as a devoted missionary-priest amidst the scenes of his former conquests. Ercilla wrote the cantos of his famous epic in his tent at night, recording the events of the day by the light of his camp fire. Castellanos wrote the reminiscences of himself and of his companions in arms in his old age. Yet, as material for history, the *Elegias* are more accurate and reliable than the *Araucana*, and the power of easy versification displayed by the old soldier-priest is marvellous. Señor Vergara gives several long extracts from the *Elegias* as examples of the style of Castellanos.

In an article in the *Nuova Antologia* for April, on the "Orlando Furioso," Signor Francesco de Sanctis brings out with much felicity of expression the distinctive features of Ariosto's genius, and of the relation in which he stood towards his own time. The perfect ease and naturalness of Ariosto's genius, his artist's *bonhomie* and thorough seriousness of pure artistic purpose, enabled him to treat chivalry without the studied irony of Cervantes, and to blend it harmoniously with the modern spirit. Ariosto's world is a bright Homeric world, in which the dream of the Renaissance has found reality.

The poetical contributions in the *Wandsbecker Bote*, which appeared from 1771 to 1775, have been collected and reprinted. All the great names in German literature are represented with the exception of Wieland.

A German translation of Lord Acton's article "The Vatican Council" (*N. B. Review*, Oct. 1870) has appeared at Munich.

It has been a long disputed question whether the discovery of printing was made by the German Guttenberg of Mayence, or the Dutchman Coster of Haarlem. A valuable contribution to this controversy has lately appeared in the *Augsburg Gazette*, under the title "Die Haarlemer Costerlegende," by Dr. A. van der Linde, who, although himself a native of Haarlem, shows, on historical and typographical grounds, that the important invention of moveable types, which is in fact printing itself, is undoubtedly due to Germany, while the priority ascribed to the Haarlem citizen rests on mere patriotic legends.

Bohemian and Sclavonic literature generally have sustained a great loss in the person of M. Karel Jaromir Erben, archivist of the city of Prague, a poet and *savant* of great distinction. Born in 1811 in the little town of Miletin, M. Erben devoted himself in early life to the study of the national literature and of its historical sources. His great work, *Regesta diplomatica necnon epistolaria Bohemiae et Moraviae* down to the year 1253, is indispensable for all students of Ancient Bohemian History. Among his more important re-publications of old Sclavonic texts, special notice here is due to his edition of the Tcheque writings of John Huss (Sebrane Spisy, &c., 3 vols. in 8vo., 1864–1868). We may also mention his *Prostonarodni Czeské Pisně*, or *Popular Songs of Bohemia*. M. Erben achieved great success as an original poet with a volume of poems entitled *Kytice* (The Nosegay), which has passed through three editions, and ranks as a standard work in the estimation of Sclavonic critics.

Blätter f. liter. Unterhaltung (April 20) contain a notice of the most promising lyric poets of Germany. The reviewer observes with regret the dearth of originality and power amongst the writers he had selected, but seems unaware that refinement of thought and melodious expression are nearly as conspicuous by their absence. He has no severer criticism than "unklare mystik" for some silly doggrel about birds and flowers, in comparison with which Miss Ingelow at her worst is sober, sensible, and musical.
